Parliament was opened on February 15th, by a speech from the throne read by Count Stolberg-Wernigerode. It contained an important appeal to the workingmen. The Emperor declared that the remedy for socialist excesses must be sought not only in repression, but equally in a positive attempt to promote the welfare of the laboring classes. For this reason he hoped the Workingmen's Accident Insurance Bill would be welcomed by the Parliament as a complement to the legislation against social democracy. In the same category he placed a bill to regulate the constitution of trade-guilds by affording means for organizing the isolated powers of persons engaged in the same trade, thus raising their economic capacity and social and moral efficiency. The speech announced that the bill providing for biennial budgets would be again presented for the consideration of Parliament, as the allied governments were still suffering from difficulties inseparable from the simultaneous sitting of the Imperial and provincial Parliaments. A stamp-tax and a brewing-tax were also announced. The new financial policy of the empire was noticed with great satisfaction by the Emperor, while the negotiations for treaties of commerce with neighboring nations on the basis of the new customs policy were declared to be near a favorable termination. With regard to the foreign relations, the speech stated that the empire maintained peaceful and amicable relations with all foreign powers; that its political relations with the great neighboring empires were especially in consonance with the friendship which personally united the Emperor with their rulers.

On February 16th Parliament organized by the re-election of Count von Arnim-Boitzenburg as president; Herr von Frankenstein, of the Center, as first vice-president; and Herr Ackermann, Conservative, as second vice-president. As Count Arnim-Boitzenburg declined the re-election, Herr von Gossler, under-secretary of state in the Prussian Ministry of Worship, was chosen in his place.

In the course of this session Prince Bismarck suffered a number of signal defeats. The principal bills introduced by the government were either rejected or considerably altered. Notably among those which were rejected were the tax-bills and the proposition to establish biennial budgets and biennial sessions of Parliament. The bill providing for a workingmen's accident insurance was considerably altered before its passage. Its principal provisions, which were considered a direct appeal of the Government to the laboring classes, became known in January, when it was before the Federal Council. As its name indicated, the bill proposed to provide for all laborers and officials employed in any mine, factory, dock, or quarry, and whose annual income did not exceed 2,000 marks, an insurance office to be conducted by the Government to secure them against accidents incurred during their labors. For those whose annual income did not exceed 750 marks, two thirds of the premium was to be paid by the employers and one third by the authorities over the poor; for those whose income exceeded that amount, one half of the premium was to be paid by the employers, and one half by those insured. The bill was introduced on April 1st, and, after a short debate, was referred on the following day to a committee of 28. During the debate the Liberal members declared that, although they were in sympathy with the idea of the bill, still they objected to many of its provisions. An important change in the bill was made by the committee, to the effect that the governments of the several states should take the matter in hand instead of the Imperial Government. On May 30th the House began the second reading of the bill, and all the propositions of the committee were adopted—i. e., providing for insurance offices established by the several states, to the exclusion of an imperial office and of private companies; while the clause providing for the aid of Government to the premiums of those laborers having an income of less than 750 marks was dropped. After a severe struggle on these clauses, the bill passed its third reading in the above form by a vote of 145 to 108; the minority comprised the majority of the Liberal groups, the Socialists, the Poles, and a part of the Imperial party, among them Count Bismarck.

The debate on the bill providing for biennial sessions and budgets began on March 8th. It was opposed by the entire Liberal party. Herr von Bennigsen declared in a long speech that the tendency of the bill was to decrease the influence of Parliament by curtailing its great privilege of annually criticising the Government. The different Conservative factions, although differing on various points, finally agreed to refer it to a committee, which was done on March 10th. This committee reported on May 5th that the imperial budget should be determined by the budgets of the several states, and that Parliament should meet annually in

October, so as not to come into collision with the Diets of the several states. The debate led to a sharp encounter between Prince Bismarck and Herr von Bennigsen, the leader of the National Liberals. Prince Bismarck in his speech declared that the Government would do everything in its power to instruct the people before the elections as to the wishes of the Government. He appealed to Herr von Bennigsen to remove the impression from the minds of his friends that a reaction was approaching. He desired above all things a co-operation of the National Liberals and the Conservatives, while at present it appeared as if all parties, from the right wing of the National Liberals to the Social Democrats, were combining against the Government. He therefore warned Herr von Bennigsen not to let himself be caught in the meshes of the Left. On the following day the proposition of the committee that the Parliament should meet annually was passed by a vote of 140 to 129, while the proposition for biennial budgets was defeated by the same vote. The majority consisted of the Liberals and the Center. On the other hand, the Conservatives and the Center succeeded in passing a clause providing for quadrennial legislative periods. As this was unacceptable to the Liberals, the entire bill was defeated on its third reading, on May 16th.

The bills providing for the brewery, stamp, and army tax were introduced in March, together with a memorandum from Prince Bismarck on the tax reform. The memorandum starts out with the supposition that Germany is far behind other nations in the matter of indirect taxes. He urged in favor of indirect taxes, the manner of their collection, and the fact that they would be distributed equitably over all classes of the population. The shortcomings and hardships of the direct taxes alone should lead to their abolition. The empire and the several states could no longer refuse to relieve the overburdened communes of the duties which properly belong to the state, such as the promotion of education and the care for the security of persons and private property. The several states, however, could only assume such duties if the empire would provide them with new revenues, as they could not possibly increase their direct taxation. In spite of the able arguments brought forward by the Government, Prince Bismarck suffered another decided defeat on this question. The brewery-tax was rejected on its second reading on May 17th, while the stamp-tax was considerably modified.

The new elections for Parliament, which were ordered to be held on October 27th, were preceded by severe struggles. In reply to the attacks from the Liberals, Prince Bismarck, early in August, caused to be published in the columns of the official "Provinzial Correspondenz" what was regarded as his electoral programme. It stated in substance that, although the programme of the Chancellor did not really

exist as a separate document, still it could be found in many manifestations. It aimed at the national regeneration and strengthening of Germany on sound economic bases; an increase in the financial strength of the empire, by a more equitable distribution of taxation; an easier method of obtaining the necessary public revenues, by perfecting the system of indirect taxes and correspondingly lowering the direct taxes; it also aimed at relieving the communes of a large part of their educational burdens and the care of the poor; the promotion of agriculture and industry; the care of the laboring classes in accordance with the laws of practical Christianity. This programme was declared as insufficient, not only by the Liberals, but also by the Catholic Center. The National Liberals in their platform declared that they would always protect the constitutional rights of the people, and would always oppose any attempt to abrogate them. They declared themselves ready to help bring about a peaceful relation between church and state, but only on condition that the positions the state had gained, after a severe struggle, should not be sacrificed. They pledged themselves to uphold the principle of personal liberty in trade and commerce, and would only consent to further demands for taxation if an actual necessity for such taxation existed, or a corresponding reduction in other quarters be made, while a healthy relation between direct and indirect taxes was upheld. They declared themselves willing to examine any proposition to improve the material welfare of the laboring classes, but protested against making questions of great importance the shield for ventures which are financially impossible.

The result of the elections was on the whole unfavorable to the Government. The strength of the parties in the new Parliament was as follows: Center, 110; Progressists, 60; the Liberal Union (Secessionists), 48; the National Liberals, 45; the German Imperial party, 27; the Popularists, or South German Democrats, 7; the German Conservatives, 50; the Poles, 18; Alsace-Lorrainers, 15; Social Democrats, 13; and Independents, or Savages, 4. It was remarked that the most prominent advocates of the new financial plans of the Chancellor, Herr von Varnbüler and others, were defeated, while the free-trade leaders of a liberal tendency, such as Richter, Forckenbeck, Stauffenberg, and others, were re-elected, some of them from two districts. The official statistics of the election give the following result: Of the 45,234,000 inhabitants of the empire, 9,090,381 were entitled to vote, and of these 5,300,784, or little more than a half, exercised their right of suffrage. Of this number of votes, 807,000 fell to the German Conservatives, 393,000 to the Free Conservatives, 2,021,000 to the Liberals, including 700,000 to the National Liberals, 460,000 to the Secessionists, 720,000 to the Progressists, and 140,000 to the Independents, or Savages; to the Center,

1,149,000; to the Poles, 196,000; to the Social Democrats, 335,000; to the Popularists, or South German Democrats, 119,000; and to the Alsace-Lorrainers, 150,000. A notable feature of this election was that Hamburg and the other large sea-ports, as well as the principal seats of manufacture, polled a largely increased Liberal vote, and thus seemed to mark their disapprobation of the Chancellor's financial plans. It was also noted that the Social Democrats lost many votes, particularly in Saxony, their former stronghold.

Parliament was opened on November 17th, by Prince Bismarck, who read the speech from the throne.

The speech declared, concerning internal affairs, that the economic policy of the Government as to reforms in the system of taxation hitherto pursued would be strictly adhered to. Stress was laid on the necessity that provision be made by the state for invalid workmen. The measures announced for the session were as follows: For the incorporation of Hamburg in the Customs' Union, for quadrennial parliaments, biennial budgets, the accident-insurance bill, tobacco monopoly, and the liquor-tax. The speech was very coolly received both in Parliament and out of it, and the Liberals particularly complained that the Emperor had taken the defeat of the Government at the polls so little into account.

Parliament organized on the 19th, by electing Karl Gerhard von Levetzow its president, Freiherr zu Frankenstein first vice-president, and Karl August Ackermann second vice-president. Of these, Freiherr zu Frankenstein belongs to the Center, and the other two to the German Conservatives. The main thing discussed by the Parliament, before its adjournment for the holidays, was the budget, and the debate on it soon assumed a purely political character. The most remarkable speech was that of Eugene Richter, the leader of the Progressist party. In a speech lasting over two hours, he reviewed the policy of the Government in such a clear and convincing manner that his remarks remained unanswered by the Government, something heretofore unknown in the German Parliament. The Government also suffered several defeats in this session before adjournment, notably on the bill providing for the creation of a council of political economists, which had been defeated in the previous session, and now met again with a similar fate.

A question which attracted considerable attention during the year was the admission of Hamburg to the German Customs Union. Hamburg has been for centuries a free port, which had always been surrounded by states that had more or less high import tariffs. Upon the creation of the German Empire, Hamburg insisted on a guarantee that her position should remain unchanged, and this guarantee was accorded her by Article XXXIV of the Imperial Constitution—that the city should remain a free port until it should itself demand to be

admitted to the Customs Union. The people of Hamburg have never shown any desire to make use of this privilege, and the tariff of 1879 only increased their aversion to such a step. The German Government, however, tried by various means to force Hamburg to give up its exceptional position. It threatened to shut off the Elbe by tax-barriers, to erect new and extensive docks at Altona and Glückstadt, which were to become the termini of imperial railways, thus shutting off Hamburg from the German import and export trade. Hamburg finally succumbed to this pressure, and, after some negotiations, a convention was concluded with the empire in May, which in many respects was still favorable to Hamburg. In the first place, the free port was not entirely abolished, but simply restricted to a smaller territory. Secondly, the Government declared itself willing to contribute the sum of at least forty million marks toward effecting the proposed changes. Thirdly, ships are to be allowed, as heretofore, to pass from the sea into the free port without custom-house inspection; and, finally, the supervision between the free port and the protective territory is to be intrusted to Hamburg officials.

The relations of the empire with the other powers of Europe were of the most friendly character. The Emperor in August met Emperor Francis Joseph of Austria, and on September 9th Alexander III of Russia at Dantzic. The latter meeting created considerable excitement, but, as far as known, no political business of any importance was transacted, and the meeting was to be regarded simply as a renewal of the good feeling hitherto existing between the two empires. The Emperor in his speech from the throne, on November 17th, declared that the meetings at Gastein and Dantzic were the expression of the close personal and political relations between the sovereigns and their empires. The confidence thus existing between the three imperial courts was a trustworthy guarantee of peace, which was the identical aim of their policy.

Negotiations with the Vatican were conducted with great activity, and the appointment of Dr. Korum as Bishop of Treves, as well as the new bishops of Fulda and Hildesheim, by the Government of Prussia, was considered as a sign that the Government had made far-reaching concessions to the Vatican in order to conciliate the Center. (See PRUSSIA.) But, notwithstanding this apparent truce, the Catholic Center in Parliament voted against several of Prince Bismarck's favorite plans. Toward the close of the year, Kurd von Schlözer, the German Minister at Washington, was sent to Rome on a special mission, and, it was even said, to reopen the German legation at the Papal court.

On February 27th Prince William, the oldest son of the Crown Prince, was married in the presence of a large assembly to Augusta Victoria, daughter of Duke Frederick of Schles-

wig-Holstein. Princess Augusta was born on January 25, 1860. It is regarded in Germany as particularly happy that the daughter of the dispossessed Duke of Schleswig-Holstein should thus become the future Empress of Germany.

GERMS, VACCINATION WITH DISEASE. Pasteur, in the course of his studies of anthrax and chicken-cholera, has discovered means of inoculating animals with milder forms of both these diseases. This milder infection is found to act as a safeguard against the virulent type of the disease, as vaccination does against the small-pox. The possible importance of the principle established by Professor Pasteur in dealing with the many deadly diseases which are ascribed to the multiplication of minute organisms can not be foreseen. The application of this mode of prevention to splenic fever, one of the most destructive and ineradicable varieties of endemic infection known, has already proved a signal success, and promises to render harmless this scourge of the farm-yard, which destroys five million dollars' worth of domestic animals in France annually, and vast numbers also in the other European countries and in Asia. After Pasteur had obtained the vaccine for this disease, which is called anthrax fever, or splenic fever in English, malignant pustule being one of its forms, and which in other countries is variously named—*charbon* in France, Milzbrand in Germany, and the Siberian pest in Russia—and after he had demonstrated its efficacy by a public experiment, he was not able at first to supply the French farmers fast enough with the virus.

The harmless germs are cultivated from the ordinary malignant ones. The change is due to the prolonged exposure of the bacteria, or microbes, as Pasteur names these pathogenic fungi collectively, to the influence of the oxygen of the atmosphere. Microbes which are cultivated in an infusion have their virulent properties diminished in proportion to the length of the exposure to the air without losing their reproductive faculty. This was proved to be due to the action of oxygen, by the fact that an infusion which is kept hermetically closed for any length of time remains capable of producing the virulent form of infection. When germs are cultivated, as in ordinary experiments, by carrying the infection successively from one infusion to another, there does not usually time enough elapse to allow oxygen to be absorbed by the micro-organisms, in quantities sufficient to modify the virulence of the infection. But by allowing the infusions, the first of which was infected with a minute drop of the blood of a fowl which had died of the *cholera des poules*, to rest exposed for different periods before continuing them in new infusions, it was found that the cultures, when live fowls were inoculated, displayed varying degrees of virulence. Thus it was possible to obtain germs which showed any degree of virulence the experimenter aimed to

produce. From infusions which had been allowed to ripen in this way he could produce any desired proportion of mortality among the chickens infected. By continuing the exposure long enough, the microbes, while still capable of propagating, lost all power of producing the pathological symptoms. By examining the tissue of the infected subject in which the morbid symptoms had been produced in a mitigated form, it was found to contain microbes of almost the same form, size, and appearance of those which cause the fatal disease. These germs of attenuated virulence reveal their presence by a local disorder, which runs a short course and then ceases. The propagation of the disturbing organisms is arrested by the power of nature to overcome the morbid tendency, and the diseased tissue is soon restored to its normal state. These localized and mitigated symptoms, if they have not been too light, have the effect of hardening the system against the disease, so that when the animal which has thus been vaccinated is inoculated with the fatal virus the malady does not appear at all, or is only of a mild and transient type. Fowls which have been fortified against the mortal infection by vaccination will usually resist all the common conditions of contagion for perhaps a year or longer. The microbe of chicken-cholera, like many other infectious microbes, does not propagate by spores or germs, but by a process of scission. One cell forms two or more, which arrange themselves into loop-like forms, and then separate to multiply further. True germs are seldom developed in these cells. Other microbes only multiply by the production of minute germs within the cells. These germs or spores are of infinitesimal size, but are capable of preserving the vital principle of the parent bacteria vigorous and unchanged, under the most adverse conditions, and for a surprising length of time. The microbes which propagate by segmentation, on the other hand, perish of starvation, after a few months, if their aliment is limited. The *Bacillus anthracis* is one of the most vigorous and persistent of the germ-producing microbes. The conditions to the problem of finding a counteracting vaccine, by obtaining a modified type of the organism, seemed much less propitious than in the case of the chicken-cholera. Sheep were infected by cropping grass over a spot where animals which had died of anthrax had been buried twelve years before. The spores had been brought to the surface by earth-worms, and, being taken in with the food of the sheep, developed into active microbes, which produced the fatal symptoms in a few hours. The difficulty was overcome by exposing the bacilli to the influence of oxygen for prolonged periods under conditions which would not allow them to develop the corpuscle-germs. It was found that in a certain kind of infusion of chicken-flesh the propagation of the microbes, which is impossible at the temperature of 45° Cent.,

proceeds at 42° and 43° by the mode of scission, and that no germs are produced at that temperature. The culture did not remain alive more than a month or six weeks. But long before that time the microbes were found to produce in sheep inoculated with them milder forms of the anthrax disease, the violence of the symptoms depending, as in the case with the chicken-cholera, upon the length of the exposure to the action of the air. These attenuated anthracoid microbes acted as a vaccine against the severer grades of the disease. These slender forms of infectious microbes, cultivated under certain conditions, will fully regain their virulent powers; but when obtained in this impoverished state they act as an effective protection against these two fatal diseases, provided they are not too far attenuated to produce the morbid symptoms of the malady in a sufficiently decided form. Two other kinds of vaccine virus have been obtained by this same method of degeneration through excess of oxygenation.

The micro-organism which produces the sheep-disease called *maladie de Chabert* has been separated by some French veterinary physicians and artificially cultivated. If certain graduated quantities are carefully injected into the blood, without contaminating the tissues, it is found that the infection produces but a slight constitutional disturbance, and at the same time so hardens the system of the inoculated animal that it is not subject to subsequent attacks of the disease. The French Government have publicly tested this discovery, which was made by MM. Arloing, Cornevin, and Thomas. Another veterinary surgeon, Galtier, tried the same experiment with the virus of hydrophobia, with which Pasteur has likewise been experimenting. Animals which received the virus directly into their circulation, not only suffered no ill effects, but when afterward inoculated with the hydrophobic virus they were found to be impervious to the infection, while animals which had not been thus protected were invariably seized by the disease when similarly inoculated. The question whether such introduction of the virus into the veins of animals after they have been infected with the disease will avert its development, as the more speedy action of vaccine lymph does in the case of small-pox, is the subject of further experimentation, and seems probable, considering the extreme slowness with which hydrophobic symptoms usually show themselves.

GIRARDIN, EMILE DE, French journalist, died in Paris, of paralysis, April 27th. He was born in Switzerland, in 1802, his mother being Madame Dupuy, the daughter of the Treasurer-General Fagnan. He bore the name of Delamothé until, in 1827, General de Girardin acknowledged him as his son. Emile de Girardin himself supposed, as some who were acquainted with the private life of the First Consul had hinted, that his real father was Napoleon, whom he resembled in feature. Girardin re-

ceived no regular education. He wrote for the press when thrown upon his own resources. A scheme for a cheap daily newspaper, to be sold for a sou, occurred to him in 1830. The popularization of the press became the main object of his thoughts and efforts. He published several cheap magazines, one of which attained an extraordinary popularity. In 1836 he founded the "Presse," the success of which realized his ambition of conducting a newspaper calculated by the character of its contents as well as by its low price to circulate much more extensively among the people than the journals of the time. The "Presse" supported the Orleans dynasty, and was conservative in its tendencies. In resentment of an accusation which was repeated in the democratic newspapers that the "Presse" was subsidized by the Government, Girardin fought a duel with Armand Carrel, mortally wounding his antagonist, and himself receiving a bullet in his thigh. From that day he forswore dueling. One of Louis Philippe's ministers was attacked by Girardin in an article charging him with promising a peerage as a bribe. For this he was tried before the Chamber of Peers in 1847, and unexpectedly acquitted. Through his popular newspaper, Girardin gained great political influence. He entered the Chamber of Deputies in 1834, and was a member almost constantly until 1848. When the revolution of that year broke out, Girardin visited the King and prevailed upon him to abdicate in favor of his grandson. Girardin received the document from Louis Philippe, but it was torn from his hands by the mob, and never known until too late. In 1849 he was again elected to the Chamber, where he voted with the radicals, except in favoring Louis Napoleon's election to the presidency. He condemned the *coup d'état*, but recommended no stronger remedy than a popular demonstration by a cessation of industry and traffic. After a brief exile he was permitted to return. In 1856 he disposed of his share in the "Presse" for a large sum. In 1866 he started the "Liberté," which was subjected to penalties and restrictions for opposing the Government. On the accession of the Ollivier Cabinet, Girardin gave his support to the empire. This culminating act of tergiversation won him the name of the "weathercock," and gave occasion for the jest that Girardin possessed the evil-eye, and his adhesion to a party was a sign of its early fall. In the beginning of the war of 1870 he led the chorus of French boasting and over-confidence. During the Commune, he proposed a scheme for dividing France into fifteen federal states. He became a strong supporter of the republic, and through the columns of the "France," which he founded in 1874, and the "Petit Journal," which he also controlled, he helped to frustrate the royalist plot of 1877. Emile de Girardin married at the outset of his career Mlle. Delphine Gay, a poetess admired for her beauty. In 1856 he took as his second wife

the Countess of Tiffenbach, widow of Prince Frederick of Nassau, from whom he obtained a judicial separation in 1872, also disclaiming the paternity of her child. His earliest essay in literature was a novel containing a plea for illegitimate children. He published during his long journalistic career several pamphlets and collections of articles, and also a number of plays, only one of which, "*Le Supplée d'une Femme*," in the authorship of which Dumas the younger was joined with him, ever came upon the stage. Girardin wrote in a striking and popular style, and was full of ingenious and original ideas of the kind which are effective in journalism. He inaugurated a new epoch in journalism, and the influence which he exerted upon the character and aims of the newspaper, though not altogether salutary, extended far beyond the boundaries of France. "One idea a day" was the motto which he enunciated in one of his papers. He used to launch forth original propositions, often of a startling character, but which never conflicted with the drift of popular sentiment. Some of his schemes were carried out by dint of the public opinion he created in their favor. He was thus the author of the reduction in the postage. In the tribune he was not effective, being no orator. His last public act was a spirited defense of the cause of General de Cissey in the Chamber.

GLACIAL PERIOD. The cause of the extreme cold which once prevailed in latitudes of the northern hemisphere now embraced in the temperate zone has been a frequent subject of scientific speculation. That a great change in climate has taken place was made evident by the discovery of the marks of glaciers, scratches in the rocks, ridges of detritus pushed up in front of the moving masses of ice, and *débris* deposited by them upon melting, which show that a great part of Europe and America was once within the region of perpetual ice; and also by the numerous fossils of animals which have been found associated with the earliest remains of man, some of still existing and some of extinct species suited to an Arctic habitat. The problem was complicated by the discovery in the same geological strata with animals which were adapted to an extremely cold climate, such as the reindeer and the musk-ox, of others whose habits were suited to all kinds of climate from the frigid to the tropical. In the same geological period with the above species lived, not only man, but the mammoth and the woolly rhinoceros, the grizzly bear and the Irish elk, the cave-lion and the hyena, and even the hippopotamus, which could only have flourished in a warm climate.

The occurrence of Arctic plants in the mountainous regions of lower latitudes, and of fossil plants of warmer climes in the tertiary deposits of the polar regions, presents a striking confirmation of this theory of extreme oscillations of climate. Fossil remains of the tertiary forests of deciduous trees have been collected by travelers in Arctic America, Siberia, Spitz-

bergen, and other lands. They included not only the genera now common to both continents of the northern hemisphere—the planes, beeches, maples, ashes, etc.—but also genera which are now of rare occurrence or narrow distribution, such as sequoia, liquidambar, magnolia, tulip-trees, gingkos, and the like. In the Antarctic hemisphere as well as in the Arctic, the distribution of plants bears evidence of the influence of glacial causes. The flora of the islands of the Antarctic Ocean reappear in the mountains of Chili. The plants of the south temperate zone are found growing on the mountains of the tropics, those of the Cape in the African lake-region, Australian genera on Kini-Balu in Borneo, New Zealand types in the highlands of New Caledonia, etc. Fossil tree-trunks found in Kerguelen's Island prove that the climate there was once warmer than at present.

The astronomical cycles of variation in the obliquity of the ecliptic and in the eccentricity of the earth's orbit taken together are commonly assigned now as the cause of the glaciation of Europe as far down as Switzerland, and of North America to New Jersey, and also of the enormous changes in climate of which the glaciation seems to have been one of the stages. Recent calculations of these astronomical periods by Croll and Stone are of interest as bearing upon the duration of the Pliocene and Quaternary periods, and upon the question of the antiquity of man. The cycle of the obliquity of the ecliptic is 21,000 years. During one half of each such period the northern hemisphere is colder than the southern, and during the other half the latter is the coldest. The northern hemisphere receives the greater share of heat at present, and in consequence an accumulation of ice is taking place at the south pole. The climatic changes due to the oscillations of the obliquity of the earth's orbit are, however, very slight in the present form of the orbit. But the form of the ellipse is subject to periodical variations, the eccentricity changing from .016, as at present, to .57. When the earth's path is nearly circular, as it now is, the differences in temperature between the hemispheres due to the oscillations of the ecliptic are almost nothing. When the eccentricity of the orbit was considerable, the effect of these oscillations in producing variations in climate which complete their cycle in periods of 21,000 years, must have been very much increased. The changes in the eccentricity of the earth's orbit have been calculated for the last million years. During the period commencing 300,000 and ending 100,000 years ago, the eccentricity ranged between .26 and .57. During that period wide variations of climate must have taken place, ranging, when the eccentricity was greatest, between a sub-tropical and an Arctic climate in the successive periods of 10,500 years in the latitudes of Paris or Boston. During a considerable part of this period

there are supposed, therefore, to have been a succession of glacial epochs between which occurred epochs when the mean temperature went as much higher as in the stage of greatest cold it stood lower than the present mean temperature. At the end of this period, when the variations were least, the mean temperature of the coldest month is estimated to have been 20° Fahr. less in the latitude of London than now, and the summer twenty days shorter at the cold epoch of the cycle. The excavation of the basins of lakes is now ascribed to glacial action. Professor Ramsay divides lakes into three classes: those which are due to irregular accumulations of drift, and which are generally very shallow; those formed by moraines; and those occupying true basins, which have been scooped out of the rocks by glacier ice. The glaciers which, according to this theory, formed the basins of the Swiss and Italian lakes must have been of enormous size, the Lake of Geneva being 984, the Lake of Brienz 2,000, the Lake of Como 1,929, and Lago Maggiore 2,625 feet deep. The ice which formed the valley of Geneva Lake must have been at least 2,700 feet thick.

GLUCOSE. Glucose and grape-sugar are the terms employed to designate the saccharine constituents of grapes and other fruits, and honey, the sugar of malt, and the saccharine products which are artificially formed from the starches. In ordinary commercial usage, glucose is employed exclusively as the name of the thick sirup which is made from corn-starch, while *grape-sugar* is applied to the solid product from the same source. In chemistry the term *glucose* is used to describe either substance, the composition of which may be equally indicated by the formula $C_6H_{12}O_6 + H_2O$.

Chemists distinguish between two kinds of glucose: dextroglucose, which turns the plane of polarization to the right; and lævoglucose, which turns it to the left. Dextroglucose, with which commercial glucose is identified, has received various names, such as granular sugar (*Krümeltucker*), grape-sugar, fruit-sugar, honey-sugar, starch-sugar, diabetic sugar, sugar of urine, chestnut-sugar, rag-sugar, etc. It occurs abundantly in sweet fruits, frequently together with cane-sugar and lævo-rotatory fruit-sugar, but is only rarely isolated in nature; in honey, with cane-sugar and inverted sugar; and in many animal liquids and tissues. Dextroglucose separates from its aqueous solution in white, opaque, granular, hemispherical or cauliflower-shaped masses, consisting of a hydrate. From alcohol of 95 per cent and upward it separates in anhydrous, microscopic, sharply defined needles, which are, however, often mixed with small portions of the hydrate, and which melt at 284° to a colorless, transparent mass. Anhydrous glucose is also obtained as a white powder by heating the hydrate to 131° or 140° in a stream of dry air, and as a fused transparent mass by heating the hydrate to 212°. Dextroglucose is much less soluble in

water than cane-sugar, requiring for solution one and a half times its weight of cold water, but dissolves in all proportions in boiling water, forming a sirup which has a very sweet taste, but is not as ropy as the sirup of cane-sugar. It is also less soluble than cane-sugar in alcohol; and the solution, saturated at the boiling heat, deposits crystals which retain a portion of the alcohol with considerable force. Lævoglucose is isomeric with dextroglucose, but is distinguished from it by turning the plane of polarization in the opposite way, or to the left. It occurs, together with dextroglucose, in honey, in many fruits, and in other sacchariferous vegetable organs. The mixture of these two sugars in equal numbers of atoms constitutes fruit-sugar, or inverted sugar, which is itself lævo-rotatory, because the specific rotatory power of lævoglucose is greater than that of dextroglucose. It is a colorless, uncrystallizable sirup or amorphous solid mass, is as sweet as cane-sugar, acts as a purgative, and is more soluble in alcohol than dextroglucose.

Commercial glucose is a thick, tenacious sirup of a yellowish tint, or almost colorless, with an average specific gravity at 20° C. or 68° Fahr. of 1.412. That which is made for summer consumption is a little more dense than that manufactured for winter use. The sweetness of glucose varies greatly with different specimens, and depends inversely on the extent to which chemical changes are allowed to proceed in the manufacture, that resulting from processes in which the conversion is stopped as soon as the starch has all disappeared having the maximum of sweetness. If the manufacture has been well conducted, the grape-sugar made from corn-starch is at first of a pure white color, but has a tendency to assume a yellowish tint when old. It is hard and brittle, does not usually take on a visible crystalline structure, and dissolves more slowly in water than cane-sugar. Its specific gravity has been found to be as high as 1.6. It is much less sweet than cane-sugar, and leaves a faint but perceptible bitter taste when dissolved in the mouth.

The manufacture of glucose has attained a very considerable magnitude, indicating an extensive use of the sugar and the sirup in the arts and in trade. Nineteen factories were in operation or ready to go into operation during 1881, in the States of New York, Ohio, Illinois, Michigan, Iowa, and Missouri, which together had a capacity for consuming more than thirty-five thousand bushels of corn daily, and eleven million bushels during the year. The works are estimated to represent more than two million dollars of capital, and to give employment to twenty-one hundred men.

Glucose is made at the factories from Indian corn by the conversion of the starch in the grain through the action of sulphuric acid, between twenty-six and thirty-two pounds being obtained from a bushel of corn. The corn is first soaked for two or three days in warm water, and is then ground on specially

prepared stones with a stream of water. The meal is next passed into a trough, the bottom of which is made of fine bolting-cloth, where the starch is washed through, after which it is led to large tanks and allowed to settle. After being beaten up with caustic soda to effect a separation of the gluten, the starch is again allowed to settle in long, shallow troughs. Having been washed free from all adhering alkali, it is next beaten up with water into a cream and conducted into the converting-tubs, which are made of wood, and are supplied with coils of copper steam-piping. In these the starch-cream is treated with dilute sulphuric acid, and steam is allowed to bubble up through the mixture from small holes in the copper pipes. This is the "open-conversion" process, and is completed in about two hours. In the "close-conversion" process, which occupies about fifteen minutes, the substances are inclosed in stout copper cylinders, and subjected to the action of superheated steam. The conversion is sometimes accomplished by fermentation, but this process requires a much longer time. The "open-conversion" method is the more usual one. After conversion the acid that has been used is neutralized by marble-dust, or by the carbonate of baryta and animal charcoal. The liquid is then filtered through cloth and animal charcoal, and is conveyed to the vacuum-pan, where it is evaporated at as low a temperature as possible, till the required degree of concentration is reached. If grape-sugar is to be made, the process of conversion, instead of being stopped as soon as the starch has disappeared, is carried on still further to a point which can be determined only by trial. After concentration, the liquid is conveyed into tanks, where the process of solidification is accomplished after several days. The sirup-glucose will not harden, except partially, and after many months, whatever the degree of concentration may be short of that necessary for the formation of sugar. Glucose and grape-sugar are sometimes bleached with sulphurous acid, but the practice is objectionable on account of the liability of that acid to form by oxidation free sulphuric acid, and leave it in the product as a dangerous impurity. Glucose, as formed in the earlier stages of the process, may be considered as a mixture of several chemical substances, among which are dextrine, genuine glucose, and a substance isomeric with cane-sugar; and it is on account of the presence of the last substance that the poorly converted glucoses are sweeter than the well converted.

Glucose is used chiefly for the manufacture of table-sirups and candies, for brewing, as food for bees, and for artificial honey. The actual amount of it employed for any of these purposes can only be estimated, for its use is unpopular, and manufacturers are unwilling to give information on the subject. It is certainly used extensively and in an increasing degree in brewing, where the artificial product may

be made to take the place of the glucose which is naturally developed in malting. All soft candies, wax, and taffies, and a large proportion of stick-candies and caramels, are made of glucose. Very often a little cane-sugar is mixed in to give a sweeter taste to the candies, but the amount of this is made as small as possible. The glucose which is made for this purpose is much thicker and denser than the ordinary glucose, it having a specific gravity that may reach 1.440, with a percentage of water as low as 6.37. A large percentage of all the glucose made is used in the manufacture of cane-sirups. In this manufacture, the glucose is mixed with some kind of cane-sugar sirups until the tint reaches a certain standard, the amount of the latter substance varying from three to ten per cent, according to circumstances. These sirups are graded according to the depth of the tint, as "A," "B," "C," etc., and are sold in the shops under various fanciful names. It is said that by reason of their cheapness, and their acceptable qualities, they have driven all the other sirups out of the market. Glucose is very extensively fed to bees, which eat it with great avidity, and store it away unchanged as honey. It is also put up directly in trade as honey—with which bees have had nothing to do—being put by means of appropriate machinery into artificial combs made of paraffine. Glucose is also employed in the preparation of condensed milk, and small quantities of it are used by vinegar-makers, tobacco-makers, wine-makers, distillers, mucilage-makers, and for some other purposes.

> Grape-sugar is also used for most of the purposes to which glucose is applied, but chiefly for the adulteration of other sugars. When it is reduced to fine powder it can be mixed with cane-sugar in any proportion, without altering its appearance, and, as it costs less than half the price of cane-sugar, the adulteration is immensely profitable.

The question whether glucose is deleterious as an article of food, which has been much discussed in the press and in public bodies, is answered, by those who have given the subject a scientific examination, in the negative. In chemical composition, glucose is identical with the natural sugars of fruits and honey which are universally accepted as wholesome foods. According to Professor W. S. Haines, of Rush Medical College, it differs from cane-sugar, so far as its physiological action is concerned, in that cane-sugar, when eaten, has to be converted into glucose before it can be assimilated, while the glucose itself is already in a condition to be assimilated directly. Professor Harvey W. Wiley, who has given special attention to the subject, and has read a paper upon it before the American Association for the Advancement of Science, does not hesitate to say that a glucose which is properly made is a salutary article of food, and that there is no reason to believe that when thus manufactured

it is any less wholesome than cane or maple sugar. It has been objected that the substance when not properly made contains impurities, one of which, free sulphuric acid, is poisonous; and Dr. R. C. Kedzie, of the Michigan State Board of Health, states that he has found in one sample 71·83 grains of free sulphuric acid, ·28 grain of sulphate of iron, and 363 grains of lime to the gallon. Professor Haines has shown, however, that it is to the direct interest of manufacturers, for the sake of the preservation of their apparatus and the salability of their product, to prevent the possibility of any free acid remaining after manufacture, and that for that reason they are accustomed to use much more marble-dust than is necessary to neutralize the acid. Professor Wiley says that a properly made glucose contains only a very little sulphuric acid and lime, "not much more than good spring-water, and perhaps an almost infinitesimal trace of copper, so slight as only to be detected in large quantities of the substance." He does not doubt, however, that glucoses "have been sold which contain large quantities of free sulphuric acid, and likewise other injurious ingredients. But these are due to carelessness in manufacture, and are not constituents of the genuine article. I have never found a glucose of this kind." A more valid objection to the use of glucose is, that it is employed as an adulterant, and is sold to consumers under the representation that it is a better and more valuable article than it is, and for several times its actual value. According to Dr. Kedzie, one gallon of sirup made from sugar-cane has more sweetening power than four gallons of glucose-sirup; consequently, if cane-sirup is worth one dollar a gallon, glucose-sirup should be sold for not more than twenty-five cents a gallon.

Glucose presents several anomalies when examined with polarized light. Its highest rotatory power is found when it is made with the least possible amount of conversion; continued boiling with dilute acid causes a gradual decrease of rotatory power; and a constant rotatory power, equivalent to about one half the maximum power exhibited by the substance, is reached only after from six to eight hours' heating at a temperature of 104° C., or 219° Fahr. The minimum rotatory power is, however, greater than that possessed by cane-sugar. Glucose has the property, which always acts inversely as the rotating power, of reducing a hot alkaline copper solution and separating the metal as a red sub-oxide.

The ordinary chemical tests for glucose are based upon the following reactions: 1. It is colored a dark brown by potash-lye, while cane-sugar is not so colored; 2. Basic nitrate of bismuth gives a black-brown coloration to the solution of glucose mixed with carbonate of sodium, and causes a grayish-brown precipitate from it; 3. Glucose reduces cupric salts immediately, whereas the reduction takes place more slowly with cane-sugar; 4. It produces a

decoloration of the alkaline solution of ferrocyanide of potassium, while cane-sugar does not; 5. The non-production of a violet-blue precipitate with nitrate of cobalt and caustic alkali indicates the presence of glucose in a solution previously known to contain cane-sugar; 6. Glucose alone in the solid state, or as a strong sirup, dissolves in strong sulphuric acid without coloration, while cane-sugar, if present, is blackened and decomposed.

Mr. P. Casamajor has described some easy processes for the detection of starch-glucose in commercial refined sugar and in sugar-house molasses. When the adulterant is present in sugar, in large enough quantities to make its use profitable, it may be readily detected with the optical saccharometer. It is a dextro-gyrate substance, and the only substance of that character that can be used in so large quantities to adulterate sugar. Somewhat less than its own weight of water is added to the suspected sugar, and the mixture is stirred for a few seconds. If starch sugar is present, it will be seen floating in the solution as white specks resembling crushed wheat. The appearance is due to the comparative insolubility of starch-glucose in cold water, and to the fact that as the cane-sugar present is crystalline, and its refrangibility is not very different from that of a sugar solution, the part of it which remains undissolved is not so distinctly seen as are the specks of starch-sugar. The specks are best seen by using a beaker glass and putting in only as much sugar and as much water as will allow the light to show through the flat bottom of the glass. If a flat-bottomed glass is not at hand, the observation may be made on a flat pane of glass. Another process is based on the fact that the taste of sugar has a tendency to dull the perception of the taste of other substances that may be mixed with it. In order to neutralize this effect we may, before tasting a suspected sample, put a pinch of pure sugar into the mouth. If, after this sugar is dissolved, but while its sweet taste is still perceived, we put on the tongue a pinch of sugar containing starch-glucose, we may distinctly perceive the bitterish taste of the glucose. The presence of chloride of tin in molasses and sugars, even when it is used in very small quantities, can be likewise easily detected by its unpleasant bitter taste, if, before tasting the suspected products, the mouth is filled with the pure sweet taste of refined cane-sugar. The adulteration of sugar-house molasses may be detected by the use of strong methylic alcohol. A straight sugar-house sirup mixed with three times its volume of this spirit will dissolve by stirring, except for a very slight turbidity, which remains suspended; while sirups containing the usual admixture of starch-sugar give a very turbid liquid, which separates when left at rest into two layers, of which the lower one is a thick, viscons deposit containing the glucose-sirup. A thin sirup (about 32° Baumé), in which the proportion of sugar to

the impurities is greater than in sugar-house molasses, and of which considerable quantities are sold, gives under the same test a marked turbidity, and a deposit of hard and gritty crystals of pure sugar on the sides and bottom of the vessel, which does not at all resemble the precipitate of starch-sugar sirup. The presence of starch-glucose in a molasses of about 40° Baumé may be easily detected by the optical saccharometer; but the direct test should show a percentage of sugar not higher than the number of Baumé degrees indicating the density, and it may be two or three per cent lower. Adulteration may also be detected by the copper test. The validity of these tests rests upon the supposition that the adulterant is added in the usual large quantities. A very small addition would not be perceived.

The "National Glucose and Grape-Sugar Association" was organized by a convention in which all the manufacturers of the United States were represented, which met in Chicago, Illinois, January 11, 1882. Mr. J. A. Cunningham, of Danville, Illinois, was chosen president, and Mr. J. Fermenich, of Buffalo, New York, vice-president of the body.

GOULD, THOMAS R., born in Boston; died in Florence, Italy, November 26, 1881. In his early life Mr. Gould was engaged with his brother in the dry-goods business, and was an active member of the Mercantile Library Association. He did not devote himself to art until he had attained quite a mature age. His only master was Seth Cheney, in whose studio he modeled his first figure in 1851. He followed his profession in Boston until 1863, and among the works which he produced were two colossal heads representing "Christ" and "Satan," both of which were shown at the Boston Athenæum in 1863. James, in his "Art Thoughts," mentions the "Christ," in its character of an opposing conception to "Satan," as "one of the finest felt and conceived idealisms in modern sculpture." Previous to the civil war, Mr. Gould had acquired a moderate fortune, which he lost in the exigencies of the succeeding crisis. In 1863 he went to Italy and settled with his family in Florence. There he devoted himself to study and work. One of his most celebrated statues is "The West Wind," that has been several times reproduced, and was brought into special prominence in 1874, through a letter written to the New York "World," by Stephen Weston Healy, who charged certain American artists in Italy, among whom he named Mr. Gould, with fraud and charlatanry—saying that "The West Wind" was a reproduction of Canova's "Hebe," with the exception of the drapery, which was modeled by Signor Mazzoli. Animated newspaper correspondence followed this charge, and it was proved groundless. Mr. Gould declared that his designs were all and entirely his own, and that not a statue, bust, or medallion was allowed to leave his studio until finished in all points on which depended their character and

expression. Among Mr. Gould's works are a number of portrait busts, including one of Emerson, now in Harvard University Library; one of William Monroe, in the Concord Library; one of John A. Andrew; one of Seth Cheney, owned by Mr. John Cheney, of Connecticut; and one of the elder Booth, in Booth's Theatre, New York. In statuary he has produced "Cleopatra," "Timon of Athens," "Ariel," a portrait statue of John Hancock, which was exhibited at the centennial celebration of the battle of Lexington in 1875, and is now in Lexington Town Hall. His portrait statue of John A. Andrew was placed in the Hingham Cemetery, by the Grand Army of the Republic. In 1878 Mr. Gould visited Boston, and exhibited "The Ghost in Hamlet," a front view of a large head in *alto rilievo*. The two *alti rilievi* representing "Steam" and "Electricity," which flank the vestibule of the "Boston Herald" building, are among his latest works.

GRAPE-CULTURE IN THE UNITED STATES. The culture of the grape in the United States is a matter of increasing interest and importance. Efforts have been made on the part of the Department of Agriculture under Government to obtain accurate information as to the extent of this culture, the surface planted in vines in the different States, and the quantity and value of the production of wine in our vast and varied country. The importance of the grape-culture is shown by noting the fact that about 5,000,000 gallons of wine are every year imported into the United States at a cost of about the same number of millions of dollars. Statistics show that, in California, over 32,000 acres are planted in vines; 13,500,000 gallons of wine are produced; estimated value, \$4,047,000. New York ranks second, in having 12,646 acres planted with vines, yielding, however, only 584,148 gallons, valued at \$387,308. Ohio has nearly 10,000 acres under this culture, yielding over 1,500,000 gallons; estimated value, \$1,628,000. Missouri ranks fourth in the number of acres planted, i. e., 7,376, which yield 1,824,000 gallons, at a value of \$1,320,000. Georgia has about 3,000 acres planted, producing over 1,000,000 gallons, at a value of some \$800,000. Other States have more or less space devoted to the culture of the grape, as is shown in the tables prepared by the Government authorities, the total being, in all the States, 181,583 acres planted, 23,453,827 gallons produced; estimated value, \$12,426,174.87.

In California some of the fruit finds its way to the markets for table consumption; the raisin industry consumes an important proportion, and a considerable quantity is worked up for the still. The vines being generally free from disease, and planted more closely, the yield per acre in fruit and wine is much greater than prevails east of the Rocky Mountains. Some sections of the State are affected by the phylloxera, but vigorous measures are being taken to restrain its ravages. But this is about

the only source of injury to the vines in the State, and the acreage in vineyards is constantly increasing. California produces, in fact, nearly two thirds of all the wine made in the United States. It may be noted here that, though this industry is not so concentrated as in California in any of the States east of the Rocky Mountains, and though there is no section in these States so free from diseases and in which the yield per acre is so great, yet, on the other hand, the Eastern vintners receive their measure of reward in the higher prices obtained for their products, being nearer the localities of consumption. The total value of the wine produced east of the Rocky Mountains is more than twice as great as that produced in California, while the product in the latter is at least from three to four million gallons greater than in the former. The total result certainly shows the importance of this industry, and its rightful claim to all due encouragement.

During the last ten years it appears that comparatively little change has been made with reference to the kind of grapes grown in the Eastern States. Of the red grapes the Concord and Ives seedling, and of the white ones the Catawba and Delaware, seem to be the favorites through the Northern States. Other varieties, as those of the Labrusca, prevail in some vicinities, and wherever the Norton's Virginia have been tried they seem to have given good results. They are found to be hardier against attacks from insects, mildew, rot, etc., while, if they yield less in quantity than the Concord, the quality of the product is found to be superior. In the States south of the 35th parallel the Vulpina and the Candicans are the favorites on account of their abundant production, the easiness of their culture, and their freedom from disease. Other varieties are being introduced, but are not likely to supersede the native varieties, at least for years to come. The diseases which attack American vines are much the same as those which afflict foreign vineyards, and every effort is being made to meet and counteract them.

GREAT BRITAIN AND IRELAND, a kingdom of Western Europe. The Queen, Victoria, was born May 24, 1819. She is a daughter of Prince Edward, Duke of Kent, the fourth son of George III; succeeded her uncle, William IV, in 1837; and married in 1840 Prince Albert of Saxe-Coburg-Gotha.

Children of the Queen.—1. Princess Victoria, born November 21, 1840; married in 1858 to the present Crown Prince of Germany. 2. Prince Albert Edward, heir-apparent, born November 9, 1841; married in 1863 to Princess Alexandra, daughter of King Christian IX of Denmark. Issue, two sons and three daughters; eldest son, Albert Victor, born January 8, 1864. 3. Prince Alfred, Duke of Edinburgh, born August 6, 1844; married in 1874 to the Grand Duchess Maria of Russia. He is heir-apparent to the Duke of Saxe-Coburg-Gotha. He has

issue, one son and three daughters. 4. Princess Helena, born May 25, 1846; married in 1866 to Prince Christian of Schleswig-Holstein-Sonderburg-Augustenburg. 5. Princess Louise, born March 18, 1848; married in 1871 to the Marquis of Lorne. 6. Prince Arthur, Duke of Connaught and Strathearne, born May 1, 1850; married March 13, 1879, to Princess Louise Margarethe, daughter of Prince Frederick Charles of Prussia. 7. Prince Leopold, born April 7, 1853. 8. Princess Beatrice, born April 14, 1857.

The Cabinet was composed as follows in the year 1881: First Lord of the Treasury and Chancellor of the Exchequer, Right Hon. W. E. Gladstone, M.P.; Lord High Chancellor, Lord Selborne; Lord President of the Council, Earl Spencer; Lord Privy Seal, Duke of Argyll; Secretaries of State: 1. Home Department, Right Hon. Sir Vernon Harcourt, Baronet, M.P.; 2. Foreign Affairs, Earl Granville; 3. Colonies, Earl of Kimberley; 4. War, Right Hon. Hugh C. E. Childers, M.P.; 5. India, Marquis of Hartington, M.P.; First Lord of the Admiralty, Earl of Northbrook; Chancellor of the Duchy of Lancaster, Right Hon. John Bright, M.P.; Chief Secretary for Ireland, Right Hon. W. E. Forster, M.P.; President of the Local Government Board, Right Hon. John G. Dodson, M.P.

The area and population of the British Empire are as follows:

COUNTRIES.	Area in square miles.	Population.
United Kingdom.....	121,608	85,246,562 (1881)
India and Ceylon.....	904,500	188,599,679 (1872)
Colonies and possessions.....	6,730,519	12,492,150
Total British Empire	7,756,927	286,338,891
Tributary states in India.	604,590	54,211,158
Total empire and dependencies.....	8,361,517	290,549,949

The population of Great Britain and Ireland, according to a preliminary report on the census taken in 1881, was as follows:

COUNTRIES.	Male.	Female.	Total.
England	11,947,726	12,660,665	24,608,391
Wales.....	677,029	682,867	1,359,895
Scotland	1,797,565	1,936,805	3,734,370
Ireland.....	2,522,504	2,691,035	5,158,839
Isle of Man.....	25,046	27,546	58,492
Channel Islands	40,334	47,397	87,731
Soldiers and sailors abroad	242,544	242,544
Total	17,253,947	17,992,615	35,246,562

The increase of population from 1821 was as follows:

YEARS.	Population.	INCREASE.	
		Total.	Annual rate per cent.
1821.....	21,272,187
1831.....	24,392,485	3,120,298	1.37
1841.....	27,057,923	2,665,438	1.04
1851.....	27,745,949	688,026	0.25
1861.....	29,321,283	1,575,339	0.55
1871.....	31,545,379	2,524,091	0.82
1881.....	35,246,562	3,401,183	1.01

The increase of population in the different countries, from 1871 to 1881, was as follows:

COUNTRIES.	Census of 1871.	Census of 1881.	INCREASE (I.) OR DECREASE (D.).	
			Total.	Annual rate.
England.....	21,495,181	24,608,391	I. 3,113,260	I. 1.35
Wales.....	1,217,185	1,359,595	I. 142,760	I. 1.11
Scotland.....	3,860,018	8,734,370	I. 374,352	I. 1.05
Ireland.....	5,412,377	5,159,589	D. 252,588	D. 0.48
Isle of Man.....	54,042	53,492	D. 550	D. 0.09
Channel Islands.....	90,596	87,731	D. 2,865	D. 0.32
Soldiers and sailors abroad.....	216,080	242,544	I. 26,764

The following table gives the area of the United Kingdom in 1871, and the estimates of the population by the Registrar-General (who does not include the islands in the British waters, nor the soldiers and sailors abroad), for 1879, 1880, and 1881:

COUNTRIES.	Square miles.	Population in 1879.	Population in 1880.	Population in 1881.
England and Wales.....	68,811	25,165,326	25,480,161	25,798,922
Scotland.....	30,468	8,627,453	8,661,292	8,695,456
Ireland.....	32,531	5,362,337	5,327,099	5,294,436
Islands in the British waters.....	803	145,000	145,000	141,223
Soldiers and sailors abroad.....	216,000	216,000	242,544
Total.....	121,608	34,516,126	34,829,552	35,172,981

The number of emigrants from the United Kingdom during the years 1853-1880 was as follows:

NATIONALITIES.	To United States.	To British North America.	To Australia and New Zealand.	To other countries.	Total.
English.....	1,110,554	222,600	560,945	126,053	2,030,152
Scotch.....	199,789	73,552	138,036	18,576	435,263
Irish.....	1,715,241	130,542	237,051	15,182	2,098,016
Foreigners.....	743,703	102,716	28,762	32,182	902,363
Not specified.....	170,645	52,560	30,899	58,243	312,647
1853-1880.....	3,939,942	587,270	990,693	260,536	5,778,441
1815-1880.....	6,004,523	1,623,984	1,801,529	311,997	9,242,033

The number of emigrants from the United Kingdom in 1880 was as follows:

NATIONALITIES.	To United States.	To British North America.	To Australia and New Zealand.	To other countries.	Total.
English.....	69,051	13,541	15,176	14,047	111,845
Scotch.....	14,471	8,221	3,059	1,305	22,056
Irish.....	83,018	4,140	5,949	584	93,641
Foreign.....	88,301	8,434	1,253	1,831	100,369
Not specified.....	1,903	4	1	2,475	4,383
Total.....	257,274	29,340	25,438	20,242	332,294

According to the census of 1881, the population of Ireland was divided as follows among the different denominations:

Roman Catholics.....	3,951,888
Church of England.....	635,670
Presbyterians.....	435,503
Methodists.....	47,669
Jews.....	453
Others.....	38,656

In the other parts of the United Kingdom an enumeration of the different denominations is not made.

The cities with more than 40,000 inhabitants, according to the census of 1881, were as follows:

London.....	3,814,571	Birmingham.....	400,757
London, with sub- urbs.....	4,764,312	Manchester.....	341,508
West Ham.....	123,692	Salford.....	176,293
Liverpool.....	552,425	Dublin (Ireland).....	398,579
Glasgow (Scotland).....	511,532	Leeds.....	309,126
		Sheffield.....	234,410

{ Edinburgh (Scot- land).....	223,190	Southampton.....	60,235

1831.....	1,654,994	1881.....	3,814,571
1841.....	1,945,417		

The receipts and expenditures from 1875 to 1881 were as follows:

YEARS.	Receipts.	Expenditures.	Surplus (S.) or Deficit (D.).
1875-'76.....	£77,181,698	£76,621,778	S. £509,920
1876-'77.....	75,565,086	75,125,227	S. 439,859
1877-'78.....	79,763,298	82,403,495	D. 2,640,197
1878-'79.....	83,115,972	85,407,789	D. 2,291,817
1879-'80.....	81,265,055	84,105,754	D. 2,840,699
1880-'81.....	84,041,283	83,107,924	S. 933,364

The revenue for the year ending March 31, 1881, was as follows:

SOURCES.	Gross receipts.	Delivered to the Exchequer.
1. Customs	£19,856,915	£19,184,000
2. Excise	27,401,164	25,900,000
3. Stamps	12,145,804	11,940,000
4. Land-tax and house-duty	2,765,851	2,740,000
5. Property and income tax	10,957,525	10,650,000
6. Post-Office	6,722,978	6,700,000
7. Telegraph service	1,529,767	1,600,000
8. Crown lands	463,488	890,000
9. Interest of sums advanced for local works and the purchase of Suez Canal shares	1,247,711	1,247,711
10. Miscellaneous	4,289,577	4,289,577
Total	£87,180,290	£84,041,288
Balance of the Exchequer on April 1, 1880		3,278,429
Other revenues of the Exchequer (reimburse-ments, loans, etc.)		81,777,111
Total		£119,091,828

The expenditures were as follows:

1. Payments out of the Exchequer for services charged on the consolidated fund:	
Interest and management of debt	£21,494,578
Terminable annuities	6,532,636
Interest of Exchequer bills	101,884
New sinking fund	851,402
Interest on loans by Bank of England	518,932
Interest and principal of Exchequer bonds (Suez)	199,854
Interest on the Indian loan	61,478
2. Other charges on the consolidated fund:	
Civil list	407,629
Annuities	161,000
Pensions	149,706
Salaries	293,651
Courts of justice	595,273
Miscellaneous expenses	262,510
3. Civil service:	
Public works	1,446,401
Public departments	2,251,845
Administration of Justice, Police, etc.	5,922,443
Public Instruction, Art, Science	4,288,214
Foreign Affairs	607,036
Pensions, charity, etc.	1,211,229
Miscellaneous	51,562
4. Army and Navy:	
Army services	15,553,601
Army services charged on account of troops in India	1,100,000
War in Afghanistan	500,000
Navy services	10,702,985

5. Charges on the revenue:

Customs	£2992,491
Internal revenue	1,855,000
Post-Office	8,415,200
Telegraph service	1,240,000
Post-Office packet service	716,984

Total ordinary expenditure	£83,107,924
Greenwich Hospital and School	158,470
Exchequer bonds paid off	5,700,000
Other expenses	80,180,434

Total

The public debt of Great Britain was as follows at each of the periods mentioned:

MARCH 31.	Funded debt.	Terminable annuities.	Not funded debt.	Total.
1877....	£712,621,855	£49,908,558	£13,943,800	£776,573,713
1878....	710,843,008	46,885,589	20,603,000	777,781,597
1879....	709,480,593	42,778,147	25,870,109	778,078,849
1880....	710,476,359	36,222,976	27,844,900	774,044,235
1881....	709,078,526	37,547,666	22,077,500	768,708,692

The value of the principal articles of import and export was as follows in 1880:

CLASSES OF GOODS.	Imports.	Exports.
Grain	£69,459,000	£721,000
Malt and other liquors	9,107,000	2,275,000
Colonial produce	44,456,000	1,805,000
Tobacco and cigars	2,877,000
Seeds and fruits	17,611,000	1,621,000
Animals and animal provisions	49,477,000	2,662,000
1. Articles of food	£187,017,000	£8,787,000
Fuel	£8,873,000
Minerals and ores	£1,774,000	693,000
Raw metals	12,144,000	84,406,000
Hairs, hides, and leather	14,707,000	1,173,000
Spinning material	83,268,000	1,187,000
Wood and timber	17,507,000
2. Raw material	£129,700,000	£45,872,000
Pottery and glassware	£1,776,000	£2,967,000
Metal manufactures	2,156,000	4,132,000
Machines and vessels	427,000	40,693,000
Leather, etc.	1,743,000	8,119,000
Yarn	8,160,000	17,148,000
Cordage and twine, woven goods and clothing	22,294,000	99,888,000
Paper	450,000	1,107,000
Wood-carvings	481,000
Manuscripts, articles for printing	970,000
3. Manufactured goods	£82,006,000	£140,462,000
4. Miscellaneous goods	£62,507,000	£27,989,000
Total merchandise	£411,230,000	£223,000,000
Precious metals	16,254,000	18,890,000
Total	£427,484,000	£241,950,000

The movement of shipping in the foreign and colonial trade was as follows (in tons):

YEARS.	ENTERED.			CLEARED.		
	British.	Foreign.	Total.	British.	Foreign.	Total.
Total entrances and clearances:						
1870	6,889,009	5,283,776	12,172,785	7,025,914	5,490,593	12,516,507
1879	18,514,550	7,518,042	26,032,592	18,919,441	7,763,417	26,682,858
1880	20,490,512	8,583,043	29,073,555	20,585,472	8,804,036	29,669,508
Laden vessels entered and cleared:						
1870	5,700,537	4,294,444	10,054,981	6,358,917	4,424,020	10,782,987
1879	15,039,579	6,052,765	21,099,344	17,095,146	5,754,231	22,849,357
1880	17,018,901	6,975,269	23,993,250	18,569,357	6,517,518	25,686,870
Steamers entered and cleared:						
1860	2,145,000	404,000	2,549,000	2,042,000	877,000	2,419,000
1879	13,619,092	2,662,351	16,281,443	13,858,925	2,809,646	16,868,571
1880	15,290,298	3,020,114	18,310,412	15,685,789	3,217,791	18,903,580

The commercial navy was as follows in 1880 :

SHIPS.	SAILING-VESSELS.		STRAIMERS.		TOTAL.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
Number of ships registered :						
United Kingdom	19,938	8,851,000	5,247	2,924,000	25,185	6,575,000
Colonies	12,098	1,647,000	1,656	226,000	13,754	1,573,000
Number of vessels used (exclusive of river-steamers) :						
Coasting	10,677	694,000	1,817	236,000	11,994	930,000
Coasting and long voyage	988	133,000	179	69,000	1,167	202,000
Long voyage	4,518	2,924,000	2,293	2,289,000	6,811	5,213,000
Total	16,183	3,751,000	8,789	2,594,000	19,972	6,345,000

The following table gives the postal statistics for the year ending March 31, 1881, discriminating between the letters, postal cards, newspapers, and money orders :

ARTICLES.	England and Wales.	Scotland.	Ireland.	Total.
Letters	992,000,000	105,000,000	79,000,000	1,176,000,000
Postal-cards	104,000,000	13,000,000	6,000,000	123,000,000
Newspapers and printed matter	315,000,000	39,000,000	28,000,000	382,000,000
Money orders :				
1. To United Kingdom	14,200,000	1,500,000	1,000,000	16,700,000
2. To foreign countries and colonies	200,000
3. From foreign countries and colonies	400,000
Amount of money orders :				
1. To United Kingdom	£20,887,000	£2,330,000	£1,848,000	£24,515,000
2. To foreign countries and colonies	458,000
3. From foreign countries and colonies	1,323,000

The following table gives a complete list of the English colonies and possessions in Europe, Asia, Africa, Australasia, and America, showing their area in square miles and population in different years, together with a summary of the whole :

COUNTRIES.	Square miles.	Population.	Year.	COUNTRIES.	Square miles.	Population.	Year.
I. EUROPE :				IV. AUSTRALASIA :			
Heligoland	0.21	1,913	1871	Queensland	668,250	218,159	1881

The actual strength of the military forces, on January 1, 1881, was as follows:

Regular army.....	183,953
Reserves.....	41,796
Militia.....	187,971
Volunteers.....	206,537
Total.....	575,262

The navy, in October, 1881, consisted of 75 ironclads, inclusive of those in the course of construction, about 360 steamers, and 120 sailing-vessels. Of this number 249 were in commission, 123 being at home, and 126 abroad. The navy is manned by 45,100 seamen, 13,000 marines, 18,400 men belonging to the Royal Navy reserve, and 2,750 volunteers; in all, 79,250 men.

For further statistics, see "Annual Cyclopædia" for 1880, article GREAT BRITAIN.

The subject of Irish land-reform and the new Liberal scheme for the settlement of the perennial Irish question, over-shadowed all other public questions of the year in Great Britain. The Government bill was carried through Parliament without serious alterations. On account of it all other parliamentary business was postponed to the next session.

The Government not only occupied the always difficult and ungrateful position of the responsible authorities in times of civil contention, when the nation is divided into opposite camps, but were in the humiliating plight of having appealed to Irish discontent when electioneering for office, and of having acknowledged the justice of Ireland's claims, when these involved nothing less than a social revolution. Lord Beaconsfield had announced his plan for dealing with the Irish movement. He would have stamped it out with an iron heel, without any concessions or compromises. The mass of the Liberal voters, the great body of the English people, though still separated by interests and feelings as far from the Irish as from any foreign nation, no longer look upon them as wild barbarians, and can not again be brought to exult in their butchery, as they may in the destruction of Zooloos and Afghans. They were almost indifferent to the result of the settlement as it affected the property rights of either landlords or tenants, and were satisfied to leave everything to the Liberal ministry, confident that while they were at the helm no more massacres would occur in Ireland. The coercive acts passed by Parliament were acquiesced in, the orders to disperse rioters in Ireland with buckshot called forth no protest, and the arbitrary imprisonment of Gladstone's Irish political antagonists was even applauded by the ranks of the party which first inscribed on its banners the maxims of personal liberty and freedom of speech; but no one hoped or feared that this Government would re-enact the sanguinary scenes the memory of which fills the hearts of Irishmen with hatred and excites in nearly every English breast a feeling of remorse. Only among the party of aristocratic sympathies did a trace of the old savage

animosity show itself. The Tories made no political stand in opposition to the land bill. They were conscious that the cause of the landlord class is scarcely less popular in England than in Ireland, and feared to precipitate a crisis in which the constitution of the House of Lords might be swept away and the fires of a land revolution be kindled in England. They therefore contented themselves with an empty parade of the legislative functions of the Peers, and with protests against the principles of the measure which merely echoed the doctrines of property ingrafted upon British thought long before by the philosophers of the opposite party. But, unable though they were to apply the means by which Irish agitation had been put down in the past, the Ministerial party were in a not less helpless position. The Irish party and the Conservatives had no difficulty in showing, in spite of Gladstone's brilliant dialectics, that the ministerial measure lacked in itself the essence of finality. It was a compromise containing a concession of principle. Its success depended upon its being accepted as a final settlement by the Irish people, and their leaders took care that its benefits should be accepted, not as a final nor even a temporary settlement, but as an earnest of the transformation of the whole social fabric. The Liberal leaders would not and dared not kill the fomenters of revolution, with whom they were at one in their condemnation of the land laws. They raised a cry of treason when the land agitators—more in obedience to wishes of the Irish citizens of the United States, who paid by their contributions the whole expenses of the agitation, than from the immediate urgency and timeliness of the question—put forth the less momentous demand of separation from the Union; but the claims of Irish self-government have been urged too often to be considered anything worse than tiresome by the British public. The Irish leaders sounded the note of revolution as soon as the land bill was passed, and, pointing to that sweeping measure as a sign of deliverance, urged the Irish peasantry to keep their "grip on the land" and recognize no claims or rights of the landlords in the soil. To defeat and defy the laws of property was declared to be a patriotic virtue. By "passive resistance" of this simple kind the Irish revolution would be finally accomplished, the landlords and the whole "English garrison" chased out of Ireland, and Irish independence, tempered only by the fictitious tie of a crown stripped of its prerogative, would be won after a brief and bloodless struggle. They felt secure of finally winning the sluggish sympathies of the democratic masses of Great Britain, with whom in the last resort rests the arbitrament of political questions. The Government sought to prevent the agitators from spreading discontent and checking the gratitude of the people for the land act by the imperfect device of throwing them all in prison. But they im-

prisoned only friends of the land act; and, in spite of the appeal of the confined Land Leaguers to the tenantry to postpone applications under the act until they were liberated, the latter applied to the land courts by thousands. Nevertheless, the act would not work. The landlords would not accept it. All the resources of legal skill were employed to frustrate its provisions. A large proportion of the decisions were appealed from. The existing law was taken advantage of to oust tenants by wholesale. As evictions multiplied, outrages increased, and, although every district was garrisoned with soldiers, the jails were choked with Land Leaguers, and the organization, which had served as a scape-goat for the troubles in Ireland, was completely stifled, yet the state of Ireland at the close of the year was much worse than at the commencement.

The foreign complications of Great Britain, which usually tend to multiply under Conservative administration, and to vanish when the Liberals come into power, all cleared away during the year. The British troops were withdrawn from Afghanistan as soon as the rule of Abdurrahman was established. In South Africa, the war with the Transvaal Boers was continued, until, after three severe British defeats, the independence of the South African republic, subject to the British regulation of the relations with native tribes and foreign nations, was conceded, an act which, though denounced as cowardly by the opponents of the Government, was accounted wise and magnanimous by the whole world outside of England. In the Greek boundary settlement, Gladstone's Philhellenic sympathies betrayed him into meddling and muddling. He sought to secure for Greece a more favorable adjustment than the Berlin protocol provided for, but the silent workings of the German Chancellor's deep-laid plans, and the voice of the European concert, forced him and the misled Greeks to accept one which was even less favorable. In Egypt, the Government adhered to the line of policy laid down by the Beaconsfield Government, to the extent of continuing the joint control of the finances with France, and, when the arrangement was menaced in the political crisis in Egypt, asserting in diplomatic communications the paramount interests of Great Britain in that country. The French commercial treaty which the Government promised, and which was to be more advantageous to England than the expired treaty of 1860, was not consummated. The French Government were under the influence of a high protectionist faction, who would agree to nothing between the exclusion of British iron and cotton fabrics from France, and the abolition of the English wine and silk duties. Negotiations were broken off and begun again repeatedly, without obtaining any proposals not involving sacrifices either of British commerce or of British revenue.

The balance of parties remained materially

the same as before, though Conservative successes in some of the by-elections indicated an ebb in the popular enthusiasm for the Government. The death of the Earl of Beaconsfield (see DISRAELI, BENJAMIN) bereft the Conservative party of a leader who had not only been the strategic head of the party organization so long, and by so indisputable a title, that no successor was found ready to take the direction, but of the brain which supplied its ideas. It was agreed that the leadership should devolve jointly upon the Marquis of Salisbury, who should succeed Lord Beaconsfield in guiding the Opposition majority in the House of Peers, and upon Sir Stafford Northcote, who should lead the minority in the Commons. The latter, with industry and prudence, acquitted himself fairly well, while Lord Salisbury somewhat lost prestige through the rash impetuosity of his utterances. A want of unity of purpose and of discipline was observable in the Conservative ranks, due not to dissensions among the leaders, but to the loss of their great leader. On moving an address to the crown for the erection of a monument to Lord Beaconsfield, May 9th, as "one who has sustained a great historic part, and done great deeds written on the page of parliamentary and national history," paying a tribute to his persistency of purpose, his power of self-government, his great parliamentary courage, his generous fidelity to his race, and kindness to struggling authors, and expressing the conviction that, in all the judgments delivered by Disraeli upon himself, his late antagonist was never actuated by sentiments of personal antipathy. The Prime Minister kept his parliamentary majority perfectly under control. Besides the defection of some representatives of the Whig aristocracy, such as the Duke of Argyll and the Marquis of Lansdowne, on account of his Irish policy, he lost none of his supporters. The division which was anticipated on account of the supposed radical leanings of the Premier had not occurred. In putting forward men and announcing measures which were formerly considered extreme, he providently took account of the shifting downward of the center of political power. New party lines are likely to be formed when the reforms he proposes in the laws of the transmission of real property are brought forward; but it is likely also that he will have the country with him in an English land reform.

The session of 1881 was a memorable one in the history of the British Parliament. Almost the entire session was consumed in the discussion of a single measure, which was finally passed in a shape wholly inadequate to afford the public relief demanded, although Parliament was called together a month before the usual date, and its sittings were continued long beyond the time of adjournment which usage has fixed. The vicissitudes of the Irish Land Bill revealed the defects of the British Constitution, which has long been held up to the

world as the model system of representation—defects which Lothar Bucher aptly characterized when he deprecated such a system of “government by a club” for Germany. This bill marks also the beginning of an epoch of changes in the political methods and habits of Great Britain consequent upon the extension of the elective franchise. The difficulties of the debate drove the Government to grave and dubious innovations in parliamentary procedure, notably the arbitrary assertion of a power to close discussion. The land act was, in its substance, still more remarkable and significant than the incidents and circumstances attending its passage. The production of the party which has been most closely identified with the doctrine of the absolute inviolability of established laws of contracts and property rights, which has been instrumental in gaining for the principle of the unlimited and inalienable control of the individual over all forms of property, not only universal acceptance in England, but currency all over the world, the land bill is, in its essence, a renunciation of those principles, though avowedly only to meet this single exigency. The measures which were asked for from Parliament, and which were enforced for the repression of the land agitation in Ireland, were a not less strange contradiction of the fundamental doctrines of the Liberal party, which has always maintained, to the fullest extent, the liberty of association and meeting, and the right of free speech. Parliament was opened January 6th.

On the opening day William E. Forster, Secretary of State for Ireland, gave notice of bills for the better protection of life and property, and for restricting the carrying and possession of arms in Ireland; and precedence was asked for these measures over all other business. Parnell and his party denounced in advance the coercive measures, and adopted a method of opposition which, when resorted to by the Home Rule party as a means of compelling the unwilling attention of Parliament to Irish questions, had raised a storm of angry indignation that overwhelmed their cause. The Land Leaguers, pursuing a more specific and radical purpose, employed the tactics of obstruction in a more resolute and thorough-going way. They determined to take advantage of all the ample facilities which the rules of the House afforded to delay and impede the repressive legislation. By interminable speeches the small group of Land League members protracted the debate on the address for two weeks amid deprecations and indignant protests from both sides of the House. On January 24th Secretary Forster moved the consideration of the protection of person and property bill. The dilatory tactics of the Irish party were pursued with redoubled energy. It became apparent that the public business could be kept in check indefinitely by this handful of members, and the introduction of some mode of *clôture*, a most distasteful expedient to Englishmen, be-

gan to be talked of. The first step of progress was the result of a trial of physical endurance. A motion of the Prime Minister's to give the Irish coercion bills precedence over the standing orders was carried, January 26th, after a continuous sitting of twenty-two hours. The tone of the public press, and the feeling out-of-doors, as well as among members of Parliament belonging to both parties, was that the course of the Irish members was a national scandal, degrading the honor of Parliament. Their motive and justification, that they were employing the legal forms of parliamentary procedure to resist the needless suspension of the constitutional liberties of their constituents and countrymen, met with much fainter signs of sympathy, even among the democratic masses to whom they appealed, than the denunciations directed against them for disregarding the time-honored comities of debate.*

The Land League members, supported by the Home Rulers, soon brought the parliamentary situation to a crisis, which was only tided over by an extraordinary infraction of the smooth tenor of legality in English affairs. The sitting which commenced at the usual hour on January 30th was protracted through the night, the whole of the next day, and the following night. After the House had been sitting for the unprecedented space of forty-two hours the Speaker, on resuming the chair on the morning of the 1st of February, forbade further speaking, and put the question. He explained that the House had been kept in session from Monday until Wednesday morning by the tedious discussion of motions for adjournment, and that an inconsiderable minority had resorted to this mode of obstruction to impede a measure recommended in the Queen's speech, and declared urgent by a large majority. “The credit and authority of this House are seriously threatened, and it is necessary they should be vindicated. Under the operation of the accustomed rules and method of procedure, the legislative

* The rules of the British Parliament were adopted by the American Congress at its first organization, and were made the law of the French Chamber of Deputies also, upon its establishment in 1814. But from the beginning they have been modified in the House of Representatives by the important rule of “the previous question.” The further restriction was adopted requiring the concurrence of one fifth of the members present before a vote can be called. In 1794 the rules were amended by forbidding discussion on questions of adjournment. A rule was adopted at a more recent period, limiting to one hour the time allowed for a single speech. In France the majority were empowered to bring a debate to a conclusion by a vote. The Chamber has also a rule requiring that twenty members should unite in demanding a division before a question, except in certain cases, can be put. The British Parliament has always felt a reluctance not only to bind its members by restrictive regulations, but to interfere with the rights of minorities, or with the utmost freedom of debate. The power of a minority to hinder legislation has been on a few occasions taken advantage of, but never, until the Irish members availed themselves of it, in a way to seriously impede parliamentary business, or to try the temper of the public. The most noteworthy instance was the obstruction of the prisons bill, which the rural members disapproved, but would not openly oppose, on account of the relief from taxation it offered their constituencies. In 1843 the question of introducing a check, like the “previous question” of the *clôture*, was seriously under the consideration of the House of Commons.

powers of the House are paralyzed. A new and exceptional course is imperatively demanded, and I am satisfied I shall best carry out the wish of the House if I decline to call upon any more members to speak, and at once proceed to put the question to the House."

The following day Mr. Parnell questioned the Home Secretary, Sir William Harcourt, with respect to the arrest of Michael Davitt, on the ground that his action, as a member of the Land League, was incompatible with a convict's ticket-of-leave. Before he had received what was deemed a satisfactory answer, Mr. Gladstone arose to bring in a resolution giving the Speaker dictatorial powers when urgency was declared. Mr. Dillon (Land Leaguer) interrupted him on a question of privilege, which the Speaker refused to hear. On his persisting in demanding his privilege, he was "named" by the Speaker, and on Gladstone's motion suspended. He refused to withdraw until he was removed by the sergeant-at-arms with a show of force. When the Speaker called upon the Prime Minister to proceed, the latter was again interrupted by Mr. Parnell, who moved that he be no longer heard. Mr. Parnell was named by the Chair, suspended, and removed with a show of force, and after him Mr. Finegan was suspended on the same provocation. Twenty-eight other Irish members, for refusing to vote in these proceedings, were suspended in a body, and excluded by the sergeant-at-arms. These were Messrs. Barry, Biggar, Byrne, Corbett, Daly, Dawson, Gill, E. Gray, Healy, Lalor, Leamy, Leahy, McCarthy, McCoan, Marum, Metge, Nelson, A. O'Connor, T. P. O'Connor, the O'Donohue, the O'Gorman Mahon, O'Sullivan, O'Connor Power, Redmond, Sexton, Smithwick, A. M. Sullivan, and T. D. Sullivan. Five others, Molloy, O'Kelly, O'Donnell, P. Power, and O'Shaughnessy, were afterward suspended separately for not taking part in the divisions, or for moving that the Prime Minister be no longer heard.*

The regulations proposed by the Government, with amendments suggested by Sir Stafford Northcote, the leader of the Opposition in the House, were adopted. They provide that when "the state of public business" is voted "urgent" by a three-fourths majority in a House of 300 members or more, the Speaker shall be endued with dictatorial authority over the proceedings of the House until he declares that the state of affairs is no longer urgent. The Speaker framed a set of rules governing the exercise of this extraordinary power. The principal one was that he should close a debate when obstructive opposition was suspected. Regarding motions of adjournment,

he laid down the rules that no such motion can be entertained during the hour for asking questions and giving notices without a vote of permission; that during debate speeches on motions for adjournment must be confined strictly to the point, and the Speaker may refuse to put such motions, or may put them without discussion, if he deems that they are made for obstructive purposes; that members who have spoken on a motion for adjournment will not be permitted to speak on another during the same debate. The Speaker is empowered to stop a member in the middle of his speech if guilty of "continuous irrelevance or tedious repetition." Motions to go into committee or pass a bill as amended are not debatable. Finally, when a division is demanded, the Speaker may call upon the members challenging it to rise, and, if they do not exceed twenty in number, the vote is not taken.

The Irish members who had been suspended issued, February 4th, a manifesto to the Irish people, urging them to maintain their orderly self-restraint and their unshaken organization, and not to be terrorized by a brief reign of despotism, nor driven from the positions of constitutional action, in spite of acts of the Irish Executive abrogating law, such as the return to penal servitude of a man well known as a counselor of restraint and prudence,* and notwithstanding the fact that the reign of force had been inaugurated against them on the floor of the House of Commons, and the voice of the Irish representation arbitrarily silenced in order that a coercion act for Ireland might be forced through the Legislature.

The protection bill was immediately declared "urgent"; yet, in spite of the new rules, the Irish party contested its passage obstinately and protracted the discussion till the 21st of February, when it was carried by a resort to the rules of urgency and the closure of the debate.

The protection bill provided for the arrest and confinement, within such districts as should be proclaimed under the act, of any persons suspected of high treason, treason-felony, or treasonable practices; and also of any crime punishable by law of the nature of an act of violence or intimidation, or the inciting to such acts, and tending to interfere with or disturb the maintenance of law and order. Persons arrested on such warrants should be detained and treated as persons accused of crime, and not as convicted prisoners. The suspension of the act of *habeas corpus*, and the extension of the powers of the Executive, continue in force until September 30, 1882.

The second of the coercive measures asked

* In the previous session, during a speech by F. H. O'Donnell, the same Speaker being in the chair, Mr. Gladstone moved "that the honorable member be no longer heard." The Speaker, in putting it to vote, remarked that no motion of the kind had been made for two hundred years, adding that it was very doubtful whether such a proceeding as that which prompted it had occurred during that time.

* Davitt. Michael Davitt was born in the county of Mayo in 1846. He lost an arm at the age of ten when working in a Lancashire cotton-factory, his father having left Ireland after being evicted from his farm in 1851. Davitt became a letter-carrier, and in 1863 a traveling salesman. He took part in the Fenian movement, and in 1870 was tried for treason-felony, and sentenced to fifteen years' penal servitude. In 1877 he was released on ticket-of-leave. From that time he devoted himself to organizing the Land League.

for by the Government, the peace preservation act, was brought in on the 2d of March, and passed the Lower House under the urgency rules on the 11th, after stormy debates. It empowered the Lord Lieutenant to prohibit the carrying of arms in any proclaimed district except by persons having special licenses; also to prohibit and regulate the importation and sale of arms in Ireland. Searches for arms could be made between sunrise and sunset under warrants naming the house and suspected person. Summary convictions and imprisonment for not longer than three months were provided for in the act, which was to remain in force five years.

As soon as the coercion acts were disposed of, Parliament turned its attention to some pressing appropriation bills. Mr. Gladstone moved that supply should be declared urgent business. This proposition excited no little surprise. It was warmly resisted by Sir Stafford Northcote, and failed to receive the requisite majority of three to one.

The first supply bill was a measure of financial relief for India. The revelation that the earlier estimates of the Afghan war expenditures were far below the actual cost was an unpleasant surprise to the British tax-payers. The Marquis of Hartington's successive statements were each one larger than the preceding, until the sum grew to £16,000,000, exclusive of the cost of the frontier railways. To relieve the Indian Government of the excessive burden thus imposed, Gladstone proposed to forgive the advance of £2,000,000, voted as a loan by the last Parliament, and to contribute £3,000,000 more in six annual installments. Gladstone's plan was adopted without opposition, and the sum of £500,000, being the first installment, was voted. The Government, in the beginning of the session, had announced their intention of withdrawing the British troops from Afghanistan, as soon as the intestine struggle was ended, and a government capable of ruling the country established. Lord Beaconsfield raised his protest against the abandonment of the conquered territory. When the way was clear, Mr. Stanhope and Lord Lytton brought forward, in Parliament, resolutions censuring the Government for the impending evacuation of Candahar, while at the same time a popular agitation was attempted. The Earl of Lytton's resolution was carried by the strong Conservative majority in the Upper House, but Mr. Stanhope's was rejected by a vote of 336 to 216. On March 22d Mr. Gladstone stated the conditions of peace agreed to with the Transvaal Boers. Supplementary estimates on account of the Transvaal war were agreed to, and other appropriations made.

On the 4th of April the Premier made his financial statement. The principal change announced in taxation for the ensuing year was the reduction of the income-tax to its old rate. To offset the deficit thus created, small additions and readjustments were made in

other taxes. The tax on foreign spirits and rum was adjusted so as to yield an estimated increase, which, with changes in the probate and legacy duties, converted the deficit into an estimated surplus of some £300,000. The income-tax, which was fivepence in the pound, had been increased the year before to sixpence, for the specific object of enabling the Government to carry out its plan of converting the malt-tax into a tax on beer. This reform has not proved an unalloyed benefit to British farmers, since, owing to new methods of brewing, it allows foreign maize and rice to compete with home-grown barley; but this fact was presented in the light of a liberation of trade. An awkward miscalculation had also to be confessed, as the drawbacks paid had amounted to £1,312,000, instead of the estimated £950,000. Referring to what are called the "death duties," he called attention to the various inequalities and needed reforms, such as requiring property in mortmain to contribute to the tax, equalizing the duties on personal property, settled and unsettled, and more nearly equalizing the duties on real-estate inheritances, which vary from one to ten per cent, according to the degree of relationship. The changes in the legacy and probate duties, by which he eked out about £400,000 of estimated revenue, are supposed to be an earnest of more sweeping measures, looking eventually to the abolition of entails, and the subjection of all property held in mortmain to taxation.

With reference to paying off the debt, Mr. Gladstone made an appeal for more vigorous efforts. He presented a statistical comparison, by which he made it appear that the burden was gradually growing more severe. Taking three periods of time, commencing with 1842, he showed that, while from 1842 to 1858 population had increased $\frac{1}{2}$ per cent per annum, the revenue $1\frac{1}{2}$ per cent, and the expenditure $2\frac{1}{2}$ per cent, from 1857 to 1873 the augmentations were 1 per cent, 3 per cent, and $1\frac{1}{2}$ per cent, respectively, and from 1874 to 1877 1 per cent, $1\frac{1}{2}$ per cent, and $3\frac{1}{2}$. But in the last two years, reaching down to March, 1880, while the population had increased by 1 per cent, the revenue had actually gone back $\frac{1}{2}$ per cent, and the expenditure had increased by $2\frac{1}{2}$ per cent. In further illustration of this movement, he mentioned that the penny in the income-tax, which in 1842 produced £772,000, in 1858 £810,000, and in 1878 £1,990,000, in this last year, for the first time in the history of the tax, had actually gone back and stood only at £1,943,000.

The Prime Minister suggested one measure, which was afterward inaugurated, though in advance of the time of action, by an act of Parliament. In 1885 a large amount of short annuities expire. That period has long been wistfully regarded by Chancellors of the Exchequer as one when the duties of the office will be lightened. Mr. Gladstone said that he should consider it an illegitimate use of the lib-

erated funds to apply them to current expenses. He proposed to replace the short annuities by long annuities, terminable in 1906, by which £60,000,000 of the principal of the public debt could be cleared off. During 1880-'81 a total reduction of debt, amounting to about £7,000,000, had been effected. This, the eleventh budget brought in by Gladstone, he declared would probably be his last.

At the time of the introduction of the Irish Land Act, the Duke of Argyll resigned his position in the Cabinet as Lord Privy Seal, on account of provisions in the bill which, he considered, put the ownership of Irish property in commission and abeyance. He was succeeded by Lord Carlingford.

The Irish Land Bill was introduced April 7th. Mr. Gladstone, in explaining the ministerial measure, denied that it was the iniquity of the Irish land laws which rendered it necessary, stating that these differed only from the English laws in being more favorable to the tenant. Neither did he believe that the conduct of the main body of Irish landlords called for legislative interference; most of them abstain from exacting all that they can under the law. The land hunger, or land scarcity, in Ireland, aggravated by recent bad seasons, and the harsh conduct of a limited number of landlords in demanding unjust rents and enforcing them by cruel evictions, were stated to be the grounds for legislation. The land act of 1870 had proved defective, but it had re-established tenant-rights, of the same nature as those which prevailed before the establishment of the present land system, and which are cherished in the traditions of the Irish people. The principle of tenant-right, however much denounced as joint proprietorship, is recognized in the laws of Great Britain and of the other countries of Europe. The fact that improvements are generally made by tenants in Ireland, and not by landlords as elsewhere, rendered it necessary, in the interests of justice, that these rights should be enlarged and protected. The claims of justice could only be satisfied by introducing the three reforms demanded in the popular agitation—fair rent, fixity of tenure, and free sale. Free sale, or the right of the tenant to assign his interest in the land, although the one of the three innovations which is the most completely in accord with modern notions of property, has been more objected to than the others. This right is the more valuable to the tenant, not only by reason of the general land-hunger, but owing to the demand for holdings, springing from motives of fancy or sentiment, as by emigrants returning from America. A land court was considered indispensable for the adjustment of the respective equities of landlords and tenants. Of the seven majority and minority reports of the Bessborough and Richmond Commissions, one appointed by the late and one by the present Government, to investigate the Irish land question, all but one agree in recommending the establishment of such a court. The bill provides for the creation of a court which is to take cognizance of rent, of tenure, and of assignment. It is an optional court, to which all tenants throughout Ireland have access, but not the landlords. The latter are not given direct access to the court, on the ground that they could force tenants into litigation, and by the possession of this power could extort special agreements as to rent. The great diversity of conditions under which land is leased in Ireland rendered it, in Gladstone's opinion, undesirable, as well as difficult, to introduce uniform regulations governing all yearly tenancies, or to establish a compulsory court to review the relations of landlord and tenant when not invoked. There is no agricultural country in the world the face of which is so seamed with variety as Ireland. You have to begin with all the usual varieties, and then you have many varieties which are exclusively Irish. You have the grazing and the village farm, the large holding and the small, the large proprietors and the small, the landlord absent and the landlord resident; you have the improvements made sometimes by the tenant and sometimes by the landlord, for there are in Ireland, what in Ireland are called in the strictest sense, improving landlords; you have the leaseholds, the annual tenancies, the care-takers of land, lands in conacre and lands in rundale; you have the lands over-rented through the operation of the great land hunger; you have the lands under-rented through the traditions of many estates, and in certain cases through the desire, and perhaps with the express purpose, of excluding tenant-right and assignment; you have the old-fashioned Irish landlord and the new-fashioned Irish landlord, and though the old-fashioned Irish landlord was not an impeccable being, yet many of his sins toward his tenant were sins of omission rather than of commission, and in some respects he would bear a not unfavorable comparison with the new-fashioned landlord. "You have land under middle-men, and you have land without middle-men; you have leases in perpetuity, and, above all, the prevalence of local customs, which have taken deep root in the country, and which, in my opinion, we should incur a very heavy responsibility by gratuitously endeavoring to wipe away from the face of the land. All these are strong reasons for making it optional to the tenant to consider whether he shall go into court or whether he shall not."

The Land Commission created by the act is empowered, when called upon by a tenant, to determine a fair rent for the holding. The judicial rent thus established can not be raised within the statutory term of fifteen years, nor can the tenant be evicted except for non-payment of rent, or for waste, subletting his farm, or other breaches of the statutory conditions. The tenant may at his option apply to the county court judge to fix a fair rent, or it may be settled by agreement with the landlord, or by arbitration; and, when it is fixed by either of these methods or by decree of the Land Court, he obtains the statutory term

of fifteen years, during which he is safe from disturbance or from an increase of rent. At the end of fifteen years he may apply to have a judicial rent fixed for another statutory term. The annual tenant is thus placed in the position of a leasehold tenant for fifteen years, with the privilege of perpetual renewal. The tenant may sell his tenancy to a single person at the best price he can get; but the right of pre-emption, or privilege of buying the tenant-right at the same price, is reserved to the landlord. Every tenant from year to year, when the landlord demands an increase of rent, acquires the statutory term if he agrees to the increase; or he may apply to the Civil Bill Court or the Land Commission to have a fair rent fixed; or he may sell his interest in his holding, or, if compelled to quit, he is entitled to compensation for disturbance, which is more liberal than under the provisions of the act of 1870. If any tenant considers his rent too high, or if the landlord considers it too low, the tenant alone or the tenant and landlord together may make application to have a judicial rent allotted, or the landlord, after failing to come to an agreement with the tenant, may apply to the court to have the fair rent determined. The clause allowing the landlord access to the court was tacked on in the Lords, and the acceptance of the amendment by Gladstone completely alienated the Irish party. The court may compel the tenant to sell his holding to the landlord, receiving full compensation as agreed upon or fixed by the court, in case the ground is required for the good of the estate or for buildings, laborers' cottages, places of worship, schools, dispensaries, or clergymen's or schoolmasters' residences.

A tenant holding under the Ulster custom may waive the custom and take the benefit of the act as ordinary present tenant, or, if he elects to remain under the custom, he is entitled to compensation for disturbance, to the right to sell, and to the statutory term when he accepts an augmentation of rent.

The statutory conditions under which the tenant can hold his farm without disturbance are—1. That he pays his rent. 2. That he does not commit persistent waste. 3. That he does not erect buildings or subdivide or sublet the holding without consent of the landlord, grass-land and manured conacre being exempted from the restriction. 4. That he commits no act to involve his tenant-right in bankruptcy proceedings. 5. That the landlord may enter for mining, quarrying, timber-cutting, or sporting purposes. 6. That he does not open a public-house without the landlord's consent. After the service of an execution for non-payment of rent the tenant has the usual six months for redemption. After the service of notice to quit for violation of the other conditions, the court has power to stop the proceedings, allowing the landlord damages for any injury suffered. The tenant may bring proceedings under the land act in either the Civil Bill Court or the Court of the Land Commission, but if summoned before the former court by the landlord he may remove the case to the Land Commission.

Leaseholders for terms expiring within sixty years will enjoy the benefits of the act as present tenants on the expiration of their leases. Tenants who have entered into leases since 1870 may have the conditions of the leases reviewed by the court, which is empowered to cancel them if they contain unreasonable or unfair provisions and were accepted by the tenants under fear of eviction or through undue influence. No tenant of a holding of less than £30 annual value can contract himself out of the benefits of the act. Landlord and tenant may agree to a lease for any term over thirty-one years, the conditions to be approved by the court if for a term less than sixty years. They may also agree to a perpetual lease either at a fixed rent or one subject to revision every fifteen years, the lease to be approved by the court in case the landlord is a tenant for life or a limited owner.

Provision is made in the act for advances to tenants of holdings of less than £30 value in arrears at the time of its passage. If they settle for one year's rent, the

Land Commissioners will advance one half the previous arrears, not to exceed one year's rent, and the remaining debt is canceled. Tenants against whom decrees of ejectment have been taken out are entitled to the same benefits. All such tenants may sell their interests. Proceedings for ejectment may be stayed by decree of the court, in order to have a fair rent fixed.

The act contains special provisions for the benefit of laborers. The court may sanction the resumption by the landlord of part of the holding for the benefit of laborers in respect of cottages, gardens, or allotments, on such conditions and terms as it may think right, including full compensation to the tenant. A tenant may, after notice to the landlord, let any portion of his land, not exceeding half an acre for each laborer, and not exceeding one letting for every twenty-one acres of the tenant's holding, subject to selection and arrangement as to rent by the court, with or without dwellings, to laborers employed on the holding. In fixing the judicial rent, the court may require cottages to be built and allotments made for laborers, and determine the rents to be paid by them. Tenants are entitled to apply for an advance of money for the purpose of building dwellings for laborers, under the landed property improvement act.

Liberal provisions are made for advances from the public funds to encourage the formation of a peasant proprietary. The commissioners after settling on a price to be paid for a holding by a tenant may advance three fourths of the purchase-money, and, if the landlord agrees, may leave the other fourth as a lien upon the property. If a sufficient number of tenants on an estate are able and willing to purchase their holdings, the commissioners may buy the estate and sell the holdings to the tenants, and may advance three fourths of the price. All advances must be repaid in annual instalments within thirty-five years, and bear 5 per cent interest; if the tenant pays the debt off sooner, he obtains more favorable terms. A peasant proprietor who is in debt for advances must not divide or sublet his holding without leave, but may sell. The commission may have it sold if the purchaser become bankrupt, or if on his death it is to be subdivided by the operation of the laws of inheritance. The commissioners are also empowered to advance money to assist emigration, especially of families from the more thickly populated districts, making provision for their transport and reception at their destination.

When Parliament reassembled, April 25th, the Conservatives commenced their assaults upon the Government measure with a series of troublesome questions by Mr. Gibson on the fixing of a fair rent and other provisions of the bill, and the debate soon took an acrimonious tone. The substitute measure of Lord John Manners, providing for the liberal expenditure of public money in fostering Irish industries, was at first proposed by the Tories as an alternative policy, but it was withdrawn and they were left only with Lord Elcho's protesting amendment, which condemned the bill as "economically unsound, unjust, and impolitic." This was rejected by a majority of just two to one. The moderate and some of the extreme Home Rulers, as well as most of the Ulster Conservatives, allied themselves to the Ministerialists in support of the measure. Mr. Parnell denounced it as a "miserable dole," and, with a portion of his party, refused to vote for the second reading. When the bill was discussed in committee, the Conservative resistance to the general policy was recommenced, but was soon abandoned by direction of Sir Stafford North-

cote. Still the contest was keenly carried on upon the details, and on some motions the ministerial majority was considerably decreased by the defection of the Whigs. Mr. Heneage's amendment exempting "English-managed" estates, that is, those which are maintained and improved by the landlords, from the free-sale clause, was defeated with a majority of 25, only by the accession of the whole Home Rule vote. Gladstone avoided a contest of doubtful issue on the fair-rent clause by striking out the prescriptions regarding the tenant's interest, and leaving it to the discretion of the court. Similar discretion had already been allowed with regard to "reasonable objections" a landlord might have to the purchaser of a tenant-right. When the fair-rent clause was reached, the Government inserted, at the suggestion of Charles Russel, the mover of the last-mentioned alteration, the instruction that the court should "have regard to the landlord's and tenant's interests respectively," an addition which was objected to by the Conservatives, but declared by Mr. Gladstone to have but slight practical effect. The provision for canceling leases made since 1870 under undue pressure was added in committee. The bill was discussed in committee from May 26th to July 22d. On June 28th Gladstone obtained a vote giving it precedence, but, knowing that the Conservatives would not agree to it, did not venture to ask for a declaration of urgency. The emigration clause was bitterly resisted by the Irish party, who resorted to obstructive tactics, but desisted when the Government prepared for all-night sittings. The sum set aside for this purpose was, however, limited to £200,000 in deference to their wishes. When the composition of the Land Commission was made known (Sergeant O'Hagan, Judicial Commissioner, with the grade of a judge, with Mr. Litton, former member of Parliament, and Mr. Vernon, a practical manager of land, as his colleagues), the Conservatives objected to the nominations on account of their well-known views on tenant-rights, while the Land League denounced them in unsparing terms. Sir Walter Barttelot's proposal that the commission should purchase estates affected by the statutory conditions, at the demand of the owners, was rejected by a majority of 63. Lord Edmond Fitzmaurice proposed the limitation of the fair-rent clause to holdings valued at less than £100, which was defeated by 36 majority. At the very close of the discussion of the amendments, July 28th, the Government accepted a suggestion of Mr. Parnell that the power of selling a tenant's interest shall be suspended until any application he may make to have a judicial rent fixed is determined. The Conservatives resolved not to oppose the third reading on the 29th; but Lord Randolph Churchill was not amenable to discipline and provoked a debate, in which Mr. Gibson for the Tories delivered a final protest against the principles of the measure, and Mr. Healy for

the Irish party declared that its real authors were languishing in jail. It was carried by a vote of 220 to 14, only a few extreme Conservatives voting.

The attitude which Lord Salisbury and the Conservative majority in the House of Lords would take in respect to the land bill was a subject of anxious doubt. Great relief was felt when the Marquis of Salisbury announced that, although he condemned the bill in its principles and in its details, it was expedient, in view of the state of affairs brought about in Ireland by the promise of this measure, to accept its main provisions, throwing the responsibility for it upon the Government, reserving only the right to remedy the most glaringly unjust and unnecessary of its consequences. The Duke of Argyll carried an amendment excepting "English-managed" holdings, which was the principal alteration made in the Upper House accepted by the Commons, the condition being added that improvements should be not only made but maintained by the landlord. The other amendments, one giving the landlord equal access to the court, and others of minor importance, were thrown out. When the bill was returned to the Lords, Salisbury declared that the Government would have to appeal to the country to decide between them and the constitutional majority of the peers. The country was thrown into a fever of excitement by this announcement. The recurrent threat of the abolition of the House of Peers if they oppose the people's will was murmured ominously. The House of Commons took up the Lords' revised amendments August 15th. The Prime Minister excited the wrath and scorn of the Irish party and of many English Radicals by announcing that the amendments would be considered on their merits, and every effort made to compromise the dispute. Several important points were conceded. Among these were the right of the landlord to get a fair rent fixed by the court, if the tenant fails to agree, without raising the rent at his own peril; the understanding that large payments for tenant-right are not to justify the reduction of rent; and the abandonment of Mr. Parnell's "suspension of proceedings" clause. With the bill as thus amended Lord Salisbury advised the House of Lords to agree, and in this form the land law (Ireland) act became a law.

Parliament was prorogued on August 27th.

The case of Charles Bradlaugh, member-elect for Northampton, furnished another unpleasant proof of defective working of Parliament and incompatibility between its arrangements and the requirements of the new British electorate. Mr. Bradlaugh was pledged to test the right of non-believers to sit in the House of Commons. He first insisted on his right to make an affirmation, as Jews, Quakers, etc., are allowed to do by statute. On the House's declining to receive his affirmation, he declared his willingness to take the formal oath. The question of his right to do so was referred to a

committee, which advised that he should be permitted to affirm with a view of having his legal rights determined. A resolution to that effect was passed, July 2, 1880. He accordingly sat and voted in the House of Commons pending the judicial decision, which was rendered in the case by Justice Mathews, March 18th. Bradlaugh argued the statutes relating to atheists, agnostics, etc., of persons who are permitted to affirm in judicial examinations, because an oath would have no binding effect on their conscience. He claimed that these enactments created a new class of persons, and brought them within the provision of the act allowing Quakers and "any other persons for the time being by law permitted to make a solemn affirmation or declaration, instead of taking an oath," to take their seats in Parliament on making an affirmation. The judge held that the evidence act was not intended to extend to the classes named the right to affirm in Parliament, and at the same time expressed the opinion that the lack of a religious belief entailed under the law no disability to sit in the Legislature. The judges, on appeal, March 31st, confirmed the decision that Bradlaugh was incapacitated for sitting in Parliament, not having taken the statutory oath. The seat was declared vacant, but at the election, April 9th, Mr. Bradlaugh was again returned for Northampton. On April 26th Mr. Bradlaugh presented himself to take the oath, but, before it was administered, Sir Stafford Northcote objected to the "act of profanation," and moved a resolution that, in view of the knowledge possessed by the House of Mr. Bradlaugh's opinions, he be not permitted "to go through the form of repeating the words of the oath." Mr. Bradlaugh delivered an earnest plea at the bar of the House, to the effect that he was under no legal disqualification, declaring that the essential part of the oath was fully binding upon his conscience. The resolution was carried. Mr. Bradlaugh then presented himself again at the table, and refused to withdraw on the order of the Speaker. Appealed to by Northcote, the Prime Minister stated that, having voted with the minority, he would leave the majority to carry out their resolution. On the motion of Sir Stafford Northcote, Mr. Bradlaugh was ordered by the House to withdraw. Conducted to the bar by the sergeant-at-arms, he again returned, and was only kept back by force. The following day he appeared at the table again. Mr. Labouchere asked the Premier to allow him to bring in an oaths bill to meet the case, but the latter objected to delaying the Irish Land Bill. Such a bill was introduced by the Attorney-General, May 3d, but the matter was postponed by desire of the Conservatives. On May 10th Mr. Bradlaugh again presented himself to take the oath, and refused to withdraw, declaring the order illegal; and again Sir Stafford Northcote was obliged to assume the leadership, and moved his expulsion and exclusion until he gave an undertak-

ing not to further disturb the proceedings of the House. On August 30th, the Attorney-General's bill having been withdrawn, Mr. Bradlaugh appeared in the lobby and attempted to penetrate the House, but was denied admission, and finally taken away struggling by the police. Many deputations had presented petitions in favor of his admission that same day, which was previously announced. Bradlaugh was in an almost fainting condition when conducted outside. On a resolution offered by the other member for Northampton, to the effect that the Speaker had exceeded his powers in having Bradlaugh driven out of the lobby, Mr. Bright reminded the majority who refused to open a portal by which the duly elected representative of a great constituency, who had been declared by the court to be not constitutionally disqualified, could enter the House, of the danger of the situation of affairs they had brought about. The crowds who had assembled at the meeting of sympathy the night before, and those which gathered in front of the halls of Parliament that morning, he said, numbered but a few thousands, "but this is exactly one of those things which grow, and the House, if it persists in its present course, will bring us into some most unfortunate and calamitous position." The scrupulosity of Parliament in refusing, against the earnest opposition of the Government, to allow Mr. Bradlaugh to take the oath on account of the expression of his religious opinions, of which it had taken formal cognizance, although professed infidels have not infrequently sat in Parliament in late years, was in great measure due to antipathy toward the man and the class to which he belongs. Charles Bradlaugh is an exceedingly popular leader among the extreme Radicals. The prejudice and exclusive spirit which went so far as to disregard the rights of a constituency on a colorable pretext, because its representative was regarded with aversion as the embodiment of obnoxious opinions, can only have the effect of bringing a larger number of the same class of democratic politicians and tribunes of the working people into Parliament than would otherwise be chosen.

But few and unimportant changes in the Government were made. The secession from the ministry of the Duke of Argyll left the Privy Seal vacant, which was given to Lord Carlingford. The governorship of Madras was made vacant by the death of Mr. Adam, and was conferred on M. E. Grant Duff, Under-Secretary of State for India in Mr. Gladstone's former administration, and well known as a Liberal member of Parliament, and for his discourses to his electors on foreign events and politics. After the conclusion of the Boer convention, L. H. Courtney, known as an advanced Liberal, was appointed Under-Secretary for the Colonies, Lord Rosebery becoming Under-Secretary for the Home Department, with special charge of Scotch affairs in the House of Lords.

The arraignment and trial of the leading

members of the Land League, before the Court of Queen's Bench at Dublin, marked a complete change of policy on the part of the Government with regard to the Irish agitation. Before the coming together of Parliament in January, the Government had not shown a disposition to adopt extraordinary or repressive measures. Parliament had not been convened to continue or replace the peace preservation act of the preceding Government; but assurances were given that the existing laws would be sufficient to secure order. The indictment of Parnell and other prominent members of the League on the charge of conspiracy, brought with the purpose of obtaining a verdict declaring the Land League to be an illegal body, and the agitators, through their public speeches, to be criminally implicated in the homicides and other agrarian outrages, was the first indication that the Government desired or deemed it within the limits of the constitutional prerogative to suppress the political agitation which they had countenanced until then.

The conspiracy trial ended on January 24th in the disagreement of the jury, and the discharge of the fourteen traversers. Justice Fitzgerald, in summarizing the counts, reduced the charges to five:

1. That the defendants combined to incite tenants not to pay rents, or not to pay more than Griffith's valuation; 2. To incite tenants dispossessed for non-payment of rent to re-enter their holdings; 3. To prevent persons taking or keeping farms from which tenants had been evicted for non-payment of rent; 4. To prevent persons buying goods taken in execution for rent; 5. To excite the people to "Boycott" those who paid rents or took evicted farms.

He charged that, if the Land League pursued among its objects incitement to "Boycotting," or to a combination to pay no rent, or deliberately exerted an influence to prevent the Queen's writs from being served, it was an illegal assembly, and all its members were guilty of conspiracy. All but two of the jurors, it transpired, were for the conviction of the accused. The release of the prisoners was celebrated by demonstrations of popular rejoicing.

The favor of the Roman Catholic clergy and the encouragement and assistance of the Irish-Americans were two large and indispensable elements in the success of the Land League. The parochial clergy naturally sided very generally and earnestly with the tenantry. The general weight of the Church's influence was favorable to the agitation until the enactment of the land law and the extreme attitude taken by the League later. After that, those priests who engaged in the movement came in conflict with the conservative tendencies of the Church. Archbishop McCabe, of Dublin, opposed the League openly and bitterly from the beginning, but his influence was far outweighed by that of another high prelate, Archbishop Croke, of Cashel, whose outspoken and eloquent advocacy gave the movement a mighty impetus in the stages which preceded the passage of the

land act. The subject of the establishment of the Ladies' Land League brought these dignitaries into open controversy in March.

The Government promised that the protection act would not be employed to repress agitation, but was aimed at the "village tyrants," the instigators of such crimes as the maiming of cattle, burning hay-stacks, dragging men from bed at night, and threatening them with fearful penalties if they pay rent, etc. But, in asking leave to bring in the bill, Mr. Foster charged the Land League with being an unlawful organization, which instituted tribunals that usurped jurisdiction in the Queen's dominions, and sought to replace the law of the land with what Mr. Parnell called an "unwritten law." His characterization of the men against whom the act was alleged to be directed, the plotters of outrages, as "contemptible, dissolute ruffians and blackguards," was remembered when the leaders of the land movement were afterward incarcerated under the act. He claimed to be in the possession of evidence of a dangerous Fenian conspiracy, on which ground treasonable offenses were included in the act. Immediately after the act received the royal assent, March 2d, the counties of Clare, Galway, Kerry, Leitrim, Limerick, Mayo, Roscommon, Sligo, and several baronies in the county of Cork, were proclaimed, and many persons were arrested, among them Michael P. Boyton, a native American, whose friends besought the interposition of the United States Government. On May 1st Dublin was proclaimed. On May 2d John Dillon, member of Parliament, who had made vehement appeals to the peasantry to preserve the League organization and resist rack-renting, was lodged in Kilmainham Jail, Dublin. He was on his way to Parliament when arrested within a proscribed district. In August he was released on account of impaired health. The arrest of Father Sheehy, a Catholic priest, caused an intense excitement.

As soon as the land bill was disposed of, Mr. Parnell moved in the House of Commons, August 17th, a vote of censure on the Government for the administration of the coercion acts, to the effect that it had not been in accordance with the pledges and declarations given by the ministers when the assent of the House to the suspension of the Constitution in Ireland was being obtained. Of the 192 "suspects" in prison, only fourteen were returned as arrested for sending threatening letters, four or five for arson, and eight for maiming cattle. Most of the prisoners, he declared, were substantial tenant-farmers, shop-keepers, poor-law guardians, and other respectable classes of people. The Solicitor-General for Ireland gave the returns a different interpretation.

Mr. Gladstone replied that, before the Government resorted to exceptional legislation, they had applied to the ordinary tribunals, and had failed to obtain the verdicts they thought necessary for the public peace. He declared

that it was not by defiant speeches, not by appealing to a country across the Atlantic as the true country of Irishmen, not by talking of Englishmen and Scotchmen as foreigners, that the Government would be induced to accelerate by one day the opening of the prison-doors.

Before the enactment of the land bill the Irish leaders, in order to secure the passage of the ministerial measure, which differed only in degree from those plans submitted by them which Mr. Gladstone expressed himself "unable to distinguish from schemes of public plunder," had kept the revolutionary movement under a curb, and were circumspect in their own utterances. But any hopes entertained in England that they would accept the large concessions of the land bill as a settlement of the land question, or even a temporary compromise, were soon dissipated. The Land League agitators placed themselves on the extreme revolutionary ground, and proceeded to employ the concessions obtained as an argument for the justice and strength of the Irish revolutionary movement. They now openly espoused the national cause, and declared that the land question which they had raised involved nothing less than a social revolution, and the complete transfer of the property and political power of the country.

A national convention of the Land League was held in Dublin in September. In the resolutions adopted, "the detestable system of alien rule" was declared to be the root of Ireland's ills, and the "right of national self-government" was claimed as the only remedy. The release of the "suspects," without condition and without delay, was demanded, without which the Irish people would never believe that the land act was intended to effect any improvement in their condition. "No settlement of the land question can be satisfactory," they boldly proclaimed, "which does not abolish landlordism, root and branch, and make the tiller also the owner of the soil."

The League announced its intention to maintain the same solid combination against landlordism which had worked such magnificent results in the past two years, and to maintain an expectant attitude with regard to the land act, while actively aiding in developing any good it might contain by taking test cases from estates in different parts of Ireland, and contesting them out of the funds of the League. The resolutions warned tenants from entering into leases pending the decision of the test cases. The farmers of Ireland were called upon to prove their sympathy with the laborers by building them dwellings, and allotting them garden-plots under the act. The Irish members of Parliament were instructed to press for provisions in the promised county government bill, giving power to the county boards to acquire land by compulsory purchase for the benefit of laborers. The members of the League were requested to use articles of Irish manufacture, and the League promised

to start industrial and labor departments for the encouragement of native industries. Until the effects of the act should be tested in the typical cases to be brought before the court under the auspices of the Land League, the tenants were advised not to avail themselves of any of the provisions of the act, except the clause relating to borrowing money for the construction of laborers' dwellings. The Roman Catholic bishops, about this same time, advised their flocks to accept the advantages of the land act, and show gratitude for this "installment of justice." When they were convinced that the Land League would be likely to modify and control the working of the land law, the Government did not hesitate as to its course. Though Mr. Bright had declared, when the Conservatives were calling for the suppression of violence in Ireland a year before, that "force is no remedy," the Liberals had drifted so far from their old moorings as to deem it a remedy for unwelcome and inconvenient political agitation. "The resources of civilization are not yet exhausted," Mr. Gladstone said, threateningly, in a speech at Leeds, October 7th.

The following week Mr. Parnell was arrested, on the ground that he incited tenants to refrain from paying rent and from applying to the Land Court.

The Leeds speech of Gladstone was an attack upon Parnell, and contained an allusion to Dillon, speaking of him in the highest terms, and crediting him with having abandoned the League. Parnell took up the challenge, and delivered at Wexford a speech filled with scathing invective against the Prime Minister. Dillon came out of his retirement to contemptuously repudiate Mr. Gladstone's praises. At a Cabinet council, held a day or two afterward, the suppression of the Land League was determined upon. Parnell was arrested on the 13th of October. The same evening a meeting of the Land League was hastily called together in Dublin, and Dillon was intrusted with the command of the organization. The following day Mr. Sexton, member of Parliament, and one of the ablest leaders of the Leaguers, was arrested, and likewise the assistant secretary of the Land League, Mr. Quinn. The same afternoon John Dillon was rearrested. Proclamations forbidding various League meetings, advertised in different towns, were issued by the Executive. William O'Brien, editor of the organ of the Land League, "United Ireland," and O'Kelly, member of Parliament, were also taken into custody that day. A. O'Connor assumed the control of the League, issuing his directions from Holyhead. Large numbers of troops were sent over to Ireland. Serious disturbances broke out at various points, but no insurrection occurred. There were riotous scenes in the streets of Dublin.

On the 18th was published a manifesto, signed by the imprisoned officers of the League—Charles Stewart Parnell, Andrew Kettle,

Michael Davitt, Thomas Brennan, John Dillon, and Thomas Sexton; and by Patrick Egan, the treasurer, who had escaped to Paris. This document declared that the Government had forced a crisis while the land act was yet untested, in order to strike down the "only power which might extort any solid benefits for the tenant-farmers of Ireland from that act." It stated that the League was preparing to test the land act, and also taking measures to secure, in the event of the land act proving to be "a mere paltry mitigation of the horrors of landlordism, in order to fasten it the more securely upon the necks of the people," that the tenant-farmers should be able to fall back upon the "magnificent organization which was crushing landlordism out of existence." The manifesto goes on as follows:

One constitutional weapon now remains in the hands of the Irish National Land League. It is the strongest, the swiftest, the most irresistible of all. We hesitated to advise our fellow-countrymen to employ it, until the savage lawlessness of the English Government provoked a crisis in which we must consent to see the Irish tenant-farmers deprived of their organization and laid once more prostrate at the feet of the landlords, and every murmur of Irish opinion suppressed with an armed hand, or appeal to our countrymen to at once resort to the only means now left in our power of bringing this false and brutal Government to its senses. Fellow-countrymen, the hour to try your souls and to redeem your pledges has arrived. The Executive of the Irish National Land League, forced to abandon the policy of testing the land act, feels bound to advise the tenant-farmers of Ireland from this time forth to pay no rents under any circumstances to their landlords, until the Government relinquishes the existing system of terrorism and restores the constitutional rights of the people. Do not be daunted by the removal of your leaders. Your fathers abolished tithes by the same methods without any leaders at all, and with scarcely a shadow of the magnificent organization that covers every portion of Ireland to-day. Do not let yourselves be intimidated by threats of military violence. It is as lawful to refuse to pay rents as it is to receive them. Against the passive resistance of an entire population military power has no weapons. Do not be wheedled into compromise of any sort by the dread of eviction. If you only act together in the spirit to which, within the last two years, you have countless times pledged your vows, they can no more evict a whole nation than they can imprison them. The funds of the National Land League will be poured out unstintedly for the support of all who may endure eviction in the course of the struggle. Our exiled brothers in America may be relied upon to contribute, if necessary, as many millions of money as they have contributed thousands to starve out landlordism, and bring English tyranny to its knees. You have only to show that you are not unworthy of the boundless sacrifices in your cause. No power on earth except faint-heartedness on your own part can defeat you. Landlordism is already staggering under the blows which you have dealt it amid the applause of the world. One more crowning struggle for your land, your homes, your lives—a struggle in which you have all the memories of your race, all the hopes of your children, all the sacrifices of your imprisoned brothers, all your cravings for rent-enfranchised land, for happy homes, and national freedom to inspire you—one more heroic effort to destroy landlordism at the very source and fount of its existence, and the system which was and is the curse of your race and of your existence will have disappeared for ever. The world is watching to see whether all your splendid hopes and noble cour-

age will crumble away at the first threat of a cowardly tyranny. You have to choose between throwing yourselves upon the mercy of England and taking your stand by the organization which has once before proved too strong for English despotism. You have to choose between all-powerful unity and impotent disorganization—between the land for the landlords and the land for the people. We can not doubt your choice. Every tenant-farmer in Ireland is the standard-bearer of the flag unfurled at Iristown, and can bear it to a glorious victory. Stand together in the face of the brutal and cowardly enemies of your race. Pay no rents under any pretext. Stand passively, firmly, fearlessly by while the armies of England may be engaged in their hopeless struggle against a spirit which their weapons can not touch. Act for yourselves, if you are deprived of the counsels of those who have shown you how to act. No power of legalized violence can extort one penny from your purses against your will. If you are evicted you should not suffer. The landlord who evicts will be a ruined pauper, and the Government which supports him with its bayonets will learn in a single winter how powerless its armed force is against the will of a united, determined, and self-reliant nation.

A counter-proclamation was issued by the Irish Executive, denouncing the League as an unlawful assembly and criminal association, and giving the assurance that all the powers and resources of the Government would be employed "to protect the Queen's subjects in Ireland, in the free exercise of their lawful rights and the peaceful pursuit of their lawful callings and occupations, to enforce the fulfillment of all lawful obligations, and to save the process of the law and the execution of the Queen's writs from hindrance or obstruction."

The offices of the Land League were taken possession of and closed by the Government on October 21st. The Ladies' Land League, under the presidency of Miss Anna Parnell, issued an address calling upon the people to remain faithful to the League, declaring that once more "an alien Government, in the hope of stifling the unconquerable resolve of the Irish race to maintain a place on the soil allotted to it by Providence, is prepared to confiscate the liberties of an entire nation." They appealed for aid for the prisoners, expressing the resolution to do their part in the great struggle "of which the issue will be the regeneration of Ireland." A resolution was offered, at a meeting of the Corporation of Dublin, to confer the freedom of the city on Parnell and Dillon, as an expression of indignation at the course of the Government, and it was only lost by the casting vote of the mayor. The "No rent" proclamation elicited a letter from Archbishop Croke, in which he advised the people not to reject the benefits of the land act at the command of their rash leaders; he subsequently recommended them to tender what they considered a fair rent, and throw the responsibility on the landlords of refusing this. The prisoners, after a few days, declined to receive longer the fare provided by the efforts of the ladies, declaring that they would be content with ordinary prison rations. In December prominent members of the interdicted League, who were still

at large, started a Prisoners' Aid Society for the purpose of alleviating the hardships of the "suspects" in Kilmainham jail, which were alleged to be severe, and that of keeping alive the interest of the people in the silenced organization.

Payments of rent were to a great extent, but by no means universally, withheld. The landlords, partly owing to this, partly to their pecuniary embarrassments, and partly to a desire to drive away their present tenants by every means, and escape, if possible, the claims which the Land Commissioners were enforcing, obtained executions from the ordinary courts by hundreds. An organization of landlords to protect their interests was started about January, under the name of the "Property Defense Association." The object was to meet the strike against rent at every point—by sending agents to attend sheriffs' sales and provide bailiffs to serve writs and carry out executions where ordinary bailiffs could not be found to do so; to provide laborers where an employer has been deserted by his help; and to find markets for his produce when the markets of the neighborhood have been closed against him. Property defense societies were now formed in every county, for the purpose of defeating, by an organized effort, the effects of the land act. Appeals were taken from all the decisions, and every form of legal delay and obstruction which was known to lawyers was interposed. Meanwhile the customary proceedings by judgment and ejectment were unsparingly resorted to. The Court of Common Pleas ruled that the existing law remained in full force, and that no stay of proceedings could be granted in actions for rent in order to allow the debtor to have his rights established in the Land Court first.

In spite of the "No rent" manifesto of the Parnellites, the applications to the Land Court came in such numbers that the commission and sub-commissions would be kept busy for several years in disposing of all the cases entered on the docket. The number of sub-commissions was increased in consequence. The first decisions of the commissioners and the construction put upon the land act created much dissatisfaction among the proprietors. A very large proportion of the decisions of the sub-commissions to the land commissioners, and appeals from the latter on points of law, were taken to the High Court of Appeals. A dictum of sub-Commissioner Baldwin, to which the landlords took great exception, was as follows:

In determining the rent we have not set up any standard of what the farming ought to be. We have taken the estate, tenants, and all as we found them. We have carefully considered the capabilities of the land in the hands of the present tenants. To others the land may be more valuable if those tenants were removed. With any speculation as to that point we have nothing to do.

The extreme uneasiness among the landlords, caused by the first decisions, abated when the number of decisions multiplied. The reduc-

tions were nevertheless so great that many landlords proposed abatements of rent amounting to from 15 to 25 per cent, but the tenants preferred to apply to the courts to fix a judicial rent.

The Land Commission and the sub-commissions proceeded industriously to work on the mass of business laid before them, but very little headway was gained. The expectation that test cases would be brought in and voluntary settlements made in conformity with the points settled in these was entirely disappointed. Reductions in rent were generally made by the commissioners—commonly about 25 or 30 per cent. Before November some 70,000 cases were entered for trial. Of the decisions rendered fully 60 per cent were appealed against.

The man-of-war *Doterel* was blown up in Magellan Strait, in May, by a boiler-explosion which fired the powder-magazine, and nearly all hands were lost. It was supposed by many, until an investigation showed the contrary, that it was the work of Irish incendiaries, and the rumor was strengthened by dark hints thrown out by a violent Fenian journal published in America.

Several crimes committed in different parts of England gave rise to the belief that a widely ramified conspiracy of Fenians, with its headquarters in New York, had been formed to carry on a work of destruction in England. A canister of gunpowder, with a lighted fuse, was found close to the walls of the Mansion House in London, March 16th. A plot was laid to destroy the militia barracks at Chester with explosives, and an explosion occurred in the barracks at Edinburgh. An attempt was made to blow up the police barracks in Liverpool, May 16th, by a piece of piping filled with powder, with a burning fuse attached. On June 10th a tube filled with dynamite was left on the steps of the Liverpool Town Hall. The perpetrators, two Irishmen, were arrested. One was a dock-laborer of Liverpool, and the other a recent arrival from New York. In the state of panic which these last outrages produced, the Land Leaguers were charged with being morally responsible for the crimes, if not accessories, and the press called for a vindictive exercise of military power in Ireland. The discovery of infernal machines on vessels arriving from America created a fresh panic. The Government was secretly informed of such shipments, and, on searching steamers on their arrival at Liverpool, six metallic boxes, containing large charges of explosives and clock-work machinery, were found in a barrel of cement, and four more were found in a second barrel and on another vessel. The Home Secretary, Sir William Harcourt, made, in the House of Commons, the following statement with reference to this and the other affairs above mentioned, connecting them with the Irish Fenian press of America:

Week by week for the last nine months, open

threats and public invitations to general outrage and private assassination have been circulated, and subscriptions for these purposes have been openly collected in the United States and actually expended for these purposes. More than one attempt of the kind has been made in England by miscreants hired and dispatched from America for this purpose, and their work has been publicly claimed by their instigators as a reward of past and a motive for fresh subscriptions.

The Government had already made representations to the Government of the United States regarding the incitements to outrages contained in certain American newspapers. The new doctrines in English law, formulated to suit the case of the "Freiheit," seem to have emboldened the Government to make the novel request that the Government at Washington should stop the utterances of the incendiary sheets, characterized by the Home Secretary as the "assassination press." The invectives and menaces of the "Irish World," the "United Irishman," and the "Sunday Democrat," which alarmed the British Government, were recited and noted with terror throughout England. But the public formed a more sober judgment than the Government displayed concerning the infernal machines. The fact of the detailed information which had been forwarded to the authorities, coupled with the other fact that, although a complete trap was laid for the consignees, no one appeared to claim the goods, led to the conclusion that the infernal machines were dispatched in order to create a sensation, and to either spread terror and dismay in Great Britain or to attract contributions to the "skirmishing fund" in the United States. A man named John Tobin was arrested at Bradford in November and brought to trial for treason-felony, a number of pistols having been found in his possession, and documents showing his connection with a Fenian organization called the Irish Republican Brotherhood.

The area in Great Britain reported under cultivation in 1881 was 32,212,000 acres, an increase of 110,000 acres as compared with 1880; but this increase consists, as for several years back, only in the inclosure of waste land for pasturage. The grain acreage was 8,848,000 acres, showing a decrease of 28,000 acres; the acreage of green crops, 3,510,000 acres, an increase of 34,000 acres; acreage of grass or clover in rotation, 4,342,000 acres, a decrease of 92,000 acres; total area of arable land, 17,568,000 acres, a decrease of 107,000 acres. The area devoted to pasture was 14,643,000 acres, showing an increase of 216,000 acres. The acreage of permanent pasture has increased from 12,435,000 acres in 1871, while that of arable land has fallen away from 18,403,000 acres to the present figures. The area under wheat, 2,806,000 acres, is 103,000 acres less, and that under barley, 2,442,000 acres, 25,000 acres less than in 1880; but the acreage of oats, 2,901,000 acres, has increased 104,000 acres. The number of cattle in Great Britain in 1881 was 5,911,642, against 5,912,046 in

1880; pigs, 2,048,000, against 2,000,000; sheep, 24,581,000, against 26,619,000. The decrease in the number of sheep, amounting to 8 per cent, was due to severe winter and spring weather, causing many deaths everywhere, to a bad lambing season in many districts, and to the disease called liver-rot. The British flocks have decreased 19 per cent since 1874. The stock of horses shows a steady increase.

In Ireland there was an increase of 10,000 acres in the grain acreage, oats showing an increase to about that extent, and wheat increasing and barley decreasing some 6,000 acres. Potatoes show an increase of 34,000 acres; clover and grasses of 89,000 acres; and flax a decrease of 10,000 acres. While the cultivation of crops was extended, the land under permanent pasture diminished in the year 170,000 acres. There was a slight decrease in the number of horses and an increase in cattle. The losses of sheep were in the same proportion as in Great Britain. In the number of pigs the large increase of 289,000 was reported.

The following table affords a survey of the agricultural statistics of the whole United Kingdom for the two years:

ACRES, ETC.	1881.	1880.
Number of acres cultivated.....	47,646,112	47,586,700
“ of acres of corn-crops.....	10,654,697	10,672,056
“ of acres of green crops.....	4,503,211	4,746,293
“ of acres of clover, etc.....	6,384,172	6,389,232
“ of acres of permanent pasture.....	27,767,767	24,717,092
“ of horses.....	1,928,619	1,929,650
“ of cattle.....	9,905,018	9,871,153
“ of sheep.....	27,896,273	30,289,620
“ of pigs.....	3,149,173	2,868,438

Of the total area of the British Islands, 77,829,000 acres, 61 per cent is cultivated—in Scotland only 25 per cent of the whole area, in England and Ireland 74 per cent. Of the cultivated area 22½ per cent is devoted to grain, 10 per cent to green crops (potatoes, turnips, etc.), 13½ per cent to meadow, 2 per cent to other crops, and 52 per cent to pasturage.

The year 1881 was another calamitous one for British agriculture. The losses of farming capital actually incurred in the series of bad seasons are estimated at £120,000,000, which was fully one third of the aggregate capital of British agriculturists. The severest losses fell in the wheat and sheep raising districts, in the south and east of England and the midland counties. In the wheat districts more than half of the farmers' wealth has disappeared. The crop of 1879 was the worst since the beginning of the century, and only two good crops have occurred in ten years. Owing to enormous imports from the United States, no rise in prices compensated for the deficient product. The general level of prices for agricultural products has not declined, however, notwithstanding the importation of vast supplies from abroad. Comparing the averages of the years 1860-'64 with 1875-'79, the imports of live cattle have increased 90 per cent, while the price has risen 16 per cent;

the imports of sheep have increased 150 per cent, while the price has risen 15 per cent; the imports of fresh meat 220 per cent, with a rise of 13 per cent in price; of butter, 75 per cent, with a rise of 16 per cent; of cheese, 135 per cent, with a rise of 8 per cent. The only variety of animal food which has declined in price is salted provisions, which fell off 7 per cent, while the imports increased 250 per cent. The imports of barley have increased 90 per cent, with a rise of 10 per cent in price; oats, 122 per cent, with a rise in price of 14 per cent; while wheat has fallen 4 per cent in price, with 75 per cent increase in the imports. English wool too has fallen 10 per cent in price, owing to increased importations and a change of fashion. The quantity of potatoes imported has increased 750 per cent, and the price has risen 10 per cent. Wheat and wool seem to be the only leading products which have been depressed in price by foreign competition. Wheat has fallen but 4 per cent, although the imports of 1880 amounted to 3,500,000 tons, or two thirds of the total supply of the population. Barley and oats are grown in perfection in the British Islands; and these cereals have risen considerably in price, and would have risen still more but for the imports of Indian corn, which competes with them as an article of food for men and animals, and serves as a substitute material also in the brewing of beer. The imports of corn have increased 228 per cent, reaching now 2,000,000 tons a year. In the last ten years 828,000 acres of grain-land and 228,000 acres of land devoted to green crops have been withdrawn from tillage and turned into permanent pasture, involving the stoppage of £8,000,000 a year in the annual returns. The pasturage has been increased by more than double this area, or an extent of reclaimed wild land exceeding that taken from the arable acreage; still the live-stock has decreased from the highest point, in 1874, by 346,000 cattle and 6,856,000 sheep, representing a loss of over £18,000,000. The "fluke" disease in sheep and the embarrassments of farmers, obliged to sell a portion of their stock to meet their engagements, owing to the succession of cold and moist seasons, account for this diminution in the census of animals.

The number of criminals received in the prisons in the year ending in July, 1881, was 149,074, against 160,729 in 1880. The average number of inmates in the prisons was 18,027, against 19,835 during the previous year. The total population of the prisons on March 31st was 15,352 males and 3,627 females. Of the males, 32 were under twelve years of age, 338 between twelve and sixteen, 3,181 between sixteen and twenty-one, making 3,551 under twenty-one, while there were 5,854 between twenty-one and thirty. The proportion of criminals between sixteen and thirty was therefore 58.9 per cent, while in the total population of the country the proportion of males between those ages is only 41.4 per cent. The number

of criminals between thirty and forty was about equal to those above forty, and only half as many as those between twenty-one and thirty. The statistics of the graver crimes show a remarkable decrease in recent times. Comparison with the statistics of years previous to 1864 is not possible, as the shortest term of penal servitude was changed by statute in that year from three to five years. Since 1864 the average number of sentences to penal servitude for periods of five years and the number for the year 1880 were as follows: 1865-'69, 2,148; 1870-'74, 1,810; 1875-'79, 1,795; 1880, 1,654. Relatively to the number of the population the diminution since 1865 has been 27 per cent. The commitments for trial averaged 19,453 from 1861 to 1865, 18,900 from 1866 to 1870, 15,174 from 1871 to 1875, and about the same number from 1876 to 1880. Crimes of violence are decreasing, notwithstanding a general impression to the contrary; crimes of shooting and stabbing with intent to maim were 123 in 1880, the average for the preceding five years having been 154. Robbery with violence decreased also; larceny decreased considerably; and assaults with intent to commit bodily harm from the average of 902 to 740. In juvenile crime since the institution of reformatories and industrial schools a remarkable decrease has taken place. The number of juvenile commitments was 14,000 in 1854; in 1879 they had fallen to 6,800, and in 1880 they were only 5,500. There are 64 reformatory schools and 136 industrial schools, besides 11 training-ships and the recently introduced industrial day-schools and truant-schools. The boys who leave the reform-schools are kept track of, and statements of their subsequent career made every three years. A small percentage relapse into criminal practices. Of the total number, 81 per cent were reported as doing well in 1879, and in 1880 92 per cent.

Since the institution of the present public-school system of England, by the act of 1870, the progress of popular education, though slow, has been continuous. The number of schools inspected in 1870 was 8,281; in 1880 they had increased to 17,743; and the accommodation in the schools, which was then not sufficient for 2,000,000 children, has been so enlarged that 4,250,000 can now be instructed. The average attendance increased from 1,152,389 in 1870, to 2,750,916 in 1880, about 150 per cent. The number of scholars registered in 1881 was 3,895,000, an increase in twelve months of 185,000; the average attendance was 2,751,000, an increase of 156,000. The number of children examined was 1,904,000, 81 per cent of those examined in the three rudimentary studies reaching the standard of proficiency. An increasing proportion apply themselves to the special studies in which those are instructed who have acquired the rudimentary branches. In these the Government grant is made dependent on the general

proficiency of the class. They were formerly limited to grammar, geography, history, and needle-work, but now include many other elementary subjects, such as can be taught from graduated text-books. A great improvement in the character of school-books has resulted from the new demand. Over 100,000 scholars went through satisfactory examinations in specific studies, having attained the highest grade in the regular course of elementary instruction; the favorite subjects were English, animal physiology, physical geography, and domestic economy. There were 41,426 certificated teachers, being an increase in a year of over 3,000, and 33,733 pupil-teachers, an increase of 538. The cost of maintenance was £2 1s. 11½d. in the board schools, and £1 1s. 7¾d. in the voluntary schools, the Government subsidy being 15s. 7¾d. per child in the former, and 15s. 5d. in the latter. The effect of the act of 1870 has been to stimulate the growth of the voluntary schools rather than to replace them with the board schools. The number of voluntary schools increased from 8,281 to 14,181 in ten years, while the national schools numbered in 1880 only 3,433, and had only two pupils to every five in the others. The teachers are recruited mainly from the training colleges, those at Battersea and Culham being the principal ones. These are so overcrowded, that certificates have been given to pupil-teachers to the number of about 3,000. The average salary has been increased from £95 to £127 for masters, since 1870, and from £57 to £72 for mistresses. The whole cost of the schools in 1880 was £5,017,253, of which £143,000 proceeded from endowments, £731,000 from voluntary subscriptions, £756,000 from rates, £1,431,000 public grants, £1,982,000 school-pence, and £65,000 from other sources.

Important changes have been made in the education code, the most significant of which is one which opens the way for graduates of the universities to become teachers. Mr. Mundella, Vice-President of the Committee of Council, stated, in presenting to Parliament the annual estimates, that the department has had applications, almost by the hundred, from university men who want occupation. The new code proposes to admit as assistant teachers in the schools graduates from any of the universities, and women who have passed certain of the higher examinations held by the universities; and after they have served for one year, if the inspector reports favorably of their skill in teaching, reading, and, in the case of women, in needle-work, to admit them to examination for certificates. The system of inspection has been reorganized, the country being divided into districts, each in charge of a chief inspector, assisted by sub-inspectors taken from the ranks of the assistant inspectors and schoolmasters. The Government grant is made dependent, in the revised code, upon the average attendance, instead of on the proficiency of the classes prepared for the annual inspection

in schools which can show an attendance of 250 pupils. Power is given, moreover, to inspectors to recommend grants for the special merits of the teaching in the separate schools.

From the excise returns it is possible to make a close estimate of the total cost of the beer and spirituous liquors consumed by the British public, and to give the quantities. The change of the malt duty into a tax on beer has resulted in affording more accurate returns of the consumption of beer. Advocates of the suppression of the drinking luxury by law are accustomed to publish statements of the national "drink bill." The following table gives the amount of money expended by the public in intoxicating beverages in the years 1879 and 1880, estimating the average price of beer at 1s. 6d. a gallon, of domestic spirits at 20s. and imported spirits at 24s. a gallon, and of wine at 18s. a gallon:

DRINK.	Gallons.	1880.	1879.
Beer.....	905,088,973	£67,881,673	£73,557,609
British spirits.....	23,457,456	23,457,456	27,936,650
Foreign spirits.....	8,477,512	10,173,014	11,449,021
Wine.....	15,552,835	14,267,102	13,450,533
British wines, etc. (est.)	15,000,000	1,500,000	1,750,000
Total.....	972,576,311	£122,279,275	£123,143,563

The decrease in consumption in 1880, as compared with 1879, was £5,864,588, or 4·6 per cent. In 1860 the drink bill was £86,897,683. With two or three trifling exceptions, it continued to grow, year by year, until in 1876 it reached the enormous total of £147,288,760. In 1877 it fell to £142,009,231; in 1878 it rose a little, being £142,188,900; since 1878 it has fallen, as the table shows.

An analysis of the expenditures of the people by a leading statistician, Leoni Levy, makes out the annual sums and the proportion of the total national income expended on various classes of necessities and superfluities as follows:

NATIONAL EXPENDITURE FOR—	Amount.	Per cent.
Food and drink.....	£349,200,000	51·0
Dress.....	123,300,000	15·0
House, coal, gas, and water....	105,500,000	15·9
Tobacco.....	3,000,000	0·4
Education.....	2,200,000	0·3
Literature, science, and art.....	5,000,000	0·7
Newspapers.....	3,500,000	0·5
Church.....	2,400,000	0·4
Theatres and music-halls.....	1,600,000	0·2
Sport and other amusements....	1,500,000	0·2
Taxes.....	7,000,000	1·0
Cost of distribution.....	77,500,000	11·4
Total.....	£654,700,000	100·0

The cost of distribution is reckoned at 20 per cent of the retail prices. Items not included in the estimate are domestic service, medical attendance, traveling, carriages and horses, charity, etc. The total national income is estimated to be £915,000,000, on £495,000,000 of which income-tax is paid, and on £420,000,000 none. Taking the number of popula-

tion to be 35,246,562, as according to the last census, the expenses enumerated above amount to £19 per head per annum, or 12·71*d.* per head per day.

GREECE, a kingdom of Southeastern Europe. Reigning King, George I, born December 24, 1845, second son of the reigning King of Denmark; elected King of the Hellenes by the National Assembly of Athens, March 18 (30), 1863; accepted the crown June 6, 1863; declared of age by a decree of the National Assembly, June 27, 1863; married October 27, 1867, to Olga, daughter of the Grand Duke Constantine of Russia, born August 22, 1851. Their children are: Constantinos, Duke of Sparta, born August 2, 1868; George, born June 24, 1869; Alexandra, born August 30, 1870; Nicholas, born January 21, 1872; Maria, born March 3, 1876; Olga, born April 6, 1880.

The area is 65,229 square kilometres; the population, according to the census of 1879, 2,067,775.*

The movement of population was as follows:

YEAR.	Marriages.	Births.	Deaths.	Excess of births.
		Exclusive of still-births.		
1875.....	10,250	44,386	30,986	13,450
1876.....	9,753	47,248	31,083	16,165
1877.....	9,472	46,355	31,280	15,075
1878.....	8,608	44,921	30,588	14,333

The receipts and expenditures in the budget of 1881 were as follows (value in drachmas; 1 drachma = 19·3 cents):

RECEIPTS.		Drachmas.
Direct taxes.....		10,596,000
Indirect taxes.....		24,800,000
Posts and telegraphs.....		1,354,200
Public domains.....		2,750,860
Sale of national lands.....		4,123,000
Miscellaneous receipts.....		4,997,000
Church revenues.....		396,000
		49,051,560
EXPENDITURES.		Drachmas.
Public debt.....		21,023,000
Pensions.....		8,889,960
Civil list.....		1,125,000
Chambers.....		560,000
Ministry of Finance.....		1,629,798
" Foreign Affairs.....		1,639,286
" Justice.....		8,018,288
" the Interior.....		5,249,859
" Public Worship and Education.....		2,477,885
" War.....		71,323,580
" Navy.....		5,282,680
Cost of collecting the revenue.....		2,458,108
Miscellaneous.....		4,488,200
Total.....		124,155,139
Deficit.....		75,108,579

The foreign debt in 1881 amounted to 320,-215,176 drachmas, the home debt to 170,192,-133 drachmas—in all, 490,407,309 drachmas.

The Greek army, according to a royal decree of January 8, 1881, is to be as follows:

	Officers.	Men.
Ministry of War and staffs.....	104	115
Infantry.....	1,004	56,821
Cavalry.....	87	2,769
Artillery.....	196	6,739
Engineers.....	120	4,514
Gendarmes.....	89	5,253
Sanitary troops, etc.....	552	8,714
	2,152	79,925

The fleet in 1881 consisted of 15 vessels, of 9,562 tons with 68 guns. Of these, two were ironclads, of 2,480 tons, 200 horse-power, and with eight guns.

The imports in 1875 amounted to 114,486,-000 drachmas, and the exports to 75,764,000 drachmas.

The only railroad is the line connecting Athens with the Piræus, which is 12 kilometres long. The telegraphic lines in 1879 were 4,009 kilometres and the wires 5,006 kilometres long. The number of offices was eighty-three, and the dispatches 331,059. The number of post-offices in 1878 was 145; the number of letters carried, 3,215,232; of postal cards, 12,168; of newspapers, 2,340,884; of printed matter and samples of merchandise, 41,990.

Preparations for a war with Turkey, and the conquest of the provinces of Thessaly and Epirus, which were awarded to Greece by the Conference of Berlin, were in full progress in the beginning of the year. A new loan of 128,000,-000 francs was voted, and an advance of 25,-000,000 francs given immediately. The guarantees for the loan were the tax on tobacco, the proceeds of the sale of national lands, and the privilege of issuing bank-notes in Thessaly and Epirus after the annexation. The Chamber adjourned on the 3d of January, after the passage of the bill, till the 27th of the same month. The National Guard, composed of the men between thirty and forty years of age, and also the reserve, numbering 10,000 or 15,000, were called out in January, thus increasing the strength of the army to 80,000 men. The message of the French Secretary for Foreign Affairs, denying that the settlement of Berlin was binding on Turkey or guaranteed by the powers, created a feeling of dread and dismay. But no party expressed itself in favor of submitting the boundary question to re arbitration. Coumoundouros, the Prime Minister, who had shown no hesitation in placing the army on a war footing, in his public utterances expressed hopes of the pacific termination of the dispute and of harmony with the will of Europe, but carefully avoided any words which implied a waiver of the claims founded on the award of Berlin. Trikoupis, the leader of the Opposition, which was as strong in the Legislature and in the country as the Government, was the spokesman of the most belligerent and uncompromising upholders of the Berlin line. Any sign of yielding to the diplomatic pressure would be the signal for the overthrow of the ministry. The people were entirely in earnest in their warlike aspirations. They fully expected to

* Inclusive of Thessaly and Epirus, ceded by Turkey in 1881. For a table showing the area and population of each of the nomarchies into which the kingdom is divided, see "Annual Cyclopædia" for 1879.

march into the border provinces on the melting of the snow. The belligerent sentiment was stronger in the country districts than at Athens.

The Chamber resumed its sessions after the holiday recess in the first week of February. The Opposition leader, Trikoupis, stormed the ministry with questions regarding the diplomatic negotiations, the military preparations, etc. The Opposition had been re-enforced by several seceders from the ranks of the ministerialists. The more moderate and pacific tone which Coumoundouros had lately taken, under the influence of foreign diplomatists, was prejudicial to his popularity. The Minister of Finance, Sotiropoulos, had sent in his resignation upon the rejection by the budget committee and a Cabinet council of a proposition to substitute a land-tax for the tax on live animals, but remained in office at the solicitation of his colleagues and the King.

The Greek army mustered not more than 7,000 men in the middle of 1880, before preparations began for a war with Turkey. Before the end of the year there were twenty-three battalions of infantry ready to march, containing 28,750 men, and a rifle corps of 9,600 men, besides two regiments of cavalry, sixteen batteries of artillery, and three engineer battalions, giving a total fighting strength of 44,830 men, not counting 4,000 gendarmes, 4,000 non-combatants, and 9,000 reserves. The discipline and efficiency of the Greek army were astonishing, considering the brief period of training it had. The Greeks boasted that they could throw 60,000 men into the border provinces. Turkey had, meantime, been arranging her finances and organizing her army for defense, and claimed to have ready 60,000 troops to hold the Thessalian plain, and 40,000, besides the local Arnaut irregulars, for the protection of Epirus. The actual Turkish garrisons in the provinces at the beginning of the year were only about one quarter as strong, being some 11,200 men of all arms in Epirus, and probably a slightly stronger force in Thessaly.

In the beginning of March, just before the opening of the conference in Constantinople, war material was landed at Volo, and preparations were made for a strong defense of Thessaly in case the Greeks crossed the border. No such precautions were necessary for the defense of Epirus. The Greek Thessalians were quiet, but there was no doubt that they would rise in a mass at the first approach of the Greek battalions. The Turkish troops in Thessaly had been increased to 29,700, with 42,000 more ready to march at the first call. Every menacing move on the part of Greece was met by counter-preparations as effective. The Greek Government issued an order calling out the National Guard on the 7th of February. When mustered at Athens they displayed great enthusiasm.

Strategical considerations had much weight with the Porte to deter it from granting terri-

torial cessions, except under extreme outside pressure, to the despised Greek nation. If it parted with Mezzovo, in the Pindus, it would relinquish an important military point, which commands not only the whole of Epirus, but Southern Albania as well. If Larissa were given up, one of the most important provinces of the southwestern Balkan region would lie at the mercy of an invading army. Janina was the most important strategic position of all. Macedonia would remain to Turkey, but, shut in between the enlarged Greece and Bulgaria, with a preponderant Bulgarian population, and with Austria reaching out to acquire the Salonica Railway line, which extends through the length of the province, it also seemed to be doomed if Thessaly and Epirus were given up.

The Treaty of Berlin fixed the two extremities of the new boundary-line at the mouths of the Kalamos and the Salambria Rivers, and directed that it should follow the general course of the two valleys. The after-conference settled on a line with curves, extending northward of a straight line between the two points, and giving to Greece Larissa, Janina, and Mezzovo. The Porte insisted on retaining these places, at the conclusion of the Berlin Conference, but appeared to be reconciled later to the cession of Larissa.

Barthélemy Saint-Hilaire, the French Minister for Foreign Affairs, dispatched about the beginning of the year a circular note to French representatives at European courts, in which he appealed to foreign cabinets, and to the Greek Government and the Porte, to have the Greek boundary dispute referred to the arbitration of the European powers. He pictured the dangers of a conflict between Greece and Turkey in terms more earnest and graphic than are customary in diplomatic documents. The slumbering passions and ambitions of the other races of European Turkey would be kindled by the example of Greece, and the whole Balkan Peninsula would soon be aflame with war. Europe would be obliged to intervene, and the resulting complications would involve the continent in the horrors and devastations of a general European war. The claims of Greece to the enforcement by the powers of the delimitation of the boundary proposed at the Berlin Conference, the French minister denied. The powers agreed in the Berlin Treaty to intermeditate for the settlement of the boundary between Turkey and Greece, if invited. When Turkey and Greece had failed to come to an agreement at Prevesa and at Constantinople, in 1879, the intermeditation of the powers was appealed to, and their engagement was discharged by the conference at Berlin in 1880, at which a boundary-line was recommended to the disputants to serve as a basis for specific negotiations. Greece accepted the counsel of the mediators, but Turkey rejected their proposals, which she was entirely free to do. The French note was dated December 24, 1880.

The position taken by France, repudiating the idea that France or Europe had promised or guaranteed to Greece the boundary proposed by the conference of the signatory powers held in June, 1880, at Berlin, was formally declared to the Greek Government in a dispatch of Barthélemy Saint-Hilaire to the French minister at Athens, Count Mony, dated December 28th. He appealed to the Greeks to submit the dispute to arbitration. The conference had suggested an extension of Greek territory of 20,000 square kilometres, and a court of arbitration could not be expected to reduce it by as much as 2,000 or 3,000 square kilometres. If Greece should reject the valuable accession of territory which would certainly be decreed to her without cost by the arbitrators, and should elect to plunge into war for the sake of a small additional extension, when the whole of the territory claimed now belongs in fact and of right to Turkey, then the civilized world would do best to leave to Greece the entire responsibility for the terrible consequences. In the complications which would result, the national existence of the Greek monarchy would not, improbably, be blotted out.

In a dispatch, dated January 7th, Barthélemy Saint-Hilaire again reviewed the situation, and emphasized his construction of the relations of the powers to the Greek question.

On the 20th of January Premier Coumoundouros addressed to the powers a circular note on the Greek claims. The Berlin Congress, recognizing the precarious state of feeling in Epirus and Thessaly, and the danger to the peace of the Orient arising from the existing condition, adopted the thirteenth protocol, relating to the rectification of the boundary. The Porte endeavored to circumvent the decision of the international Areopagus, after signifying its acceptance in principle. The negotiations over the particulars were continued over three years without results, so that the supplementary conference became necessary. The conference of 1880 settled upon a boundary-line which satisfied the requirements of the Treaty of Berlin. The Porte then recognized the authority of the decision, which was spoken of as assigning important provinces to Greece. Now it is sought to interpret it as a mere recommendation, the execution of which might be refused or deferred indefinitely. The Turkish policy of procrastination has no other aim than to stir up race passions in the border provinces, for the purpose of changing the proportions of the different nationalities in the population, and to tire out the Hellenic kingdom, which had made military preparations to occupy the territory assigned to it by the decree of Europe, and to restore order there. Europe ought to take measures to carry out the decision, and remove the cause of the strained and embittered state of feeling which was continually growing worse, and the dangers to the border provinces, to Greece, and to Turkey, which were imminent.

In a letter of instructions to Turkish ambassadors, dated the 14th of December, the Porte offered to confer with the great powers concerning the Greek boundary, through their ambassadors at Constantinople, but refused to submit the matter to a court of arbitration. The government at Athens likewise rejected the proposal for a new arbitration.

The preliminaries to the conference proposed by the Porte were protracted till March. The Greek and Turkish Governments were prevailed upon to engage that no offensive steps would be taken before the negotiations with the powers were ended. Greece was informed that no aid would be extended by the powers, in case she refused to accept the boundary agreed upon. The Cabinets of Berlin and Vienna were in accord with the position taken by the French Government. To this the British ministry also gave a formal adherence, in order to not break the European concert, but was inclined to uphold the guarantee of the Berlin Conference, and anxious to safeguard the interests of Greece.

Messinesis, of Ægion, interpellated the government in the Chamber, February 24th, with reference to the diplomatic steps taken. He dilated upon the wrongs committed upon the Greeks in Thessaly, the severity with which the poll-tax was being collected, and the imprisonment, proscription, and barbarous treatment of the Hellenes. In Epirus and Albania as well, the Greek population was driven into banishment and thrown into prison by thousands, and whole towns were destroyed through the atrocities of the irregular soldiery from Asia, which had been let loose upon the land.

Coumoundouros answered that all had been done which a Greek Government could do for their oppressed brothers; that they knew nothing about negotiations in Constantinople, and acknowledged only one decision of Europe, that of the Berlin Conference.

About the 1st of March, the Minister for Foreign Affairs and Premier, Coumoundouros, was visited by the ministers of the treaty powers in a body. In answer to an interrogatory in the Chamber regarding the circumstance, he gave the information that it was to notify him that fresh negotiations for a peaceful compromise had been entered upon at Constantinople, and that the Porte had promised not to commence hostilities pending the consultations, and to obtain from him a like assurance; to which request he gave the following answer: "The King's government will be guided by the wishes of the powers, as it always has, in the past. It will abstain from any hostile act against the neighboring state, in the hope that the negotiations commenced in Constantinople will speedily confirm and regulate the execution of the award of Europe."

The first proposition made by the Porte to the conference was the transfer of Crete, and the cession of the portion of Thessaly between the existing boundary and the Peneus.

This arrangement was warmly approved by Count Hatzfeld, the German ambassador, and favored by all the others except the British representative. The latter would not hear of the substitution of the great island which guards the *Ægean*, just as Beaconsfield and Salisbury opposed its cession when demanded at the Berlin Congress by the Greek delegates, Brailas and Delijannis, and approved by Waddington. The Porte now withdrew this proposition, and promised to grant nearly the whole of Thessaly and a small strip of Epirus, including a part of the coast of the Gulf of Arta, but retaining Prevesa as well as Janina and Mezzovo. Goeshen insisted upon the cession of the entire Gulf of Arta. The ambassadors, after prolonged discussion of the arrangement to which the Porte had been induced to accede, and after modifications favorable to Greece were agreed to, all concurred in the settlement and obtained the approval of their governments. The acceptance of the compromise by Greece was then all that was wanting. The unanimous agreement of the powers in the new settlement had the legal effect of annulling the former decision. The conclusions were communicated to the Greek Government in an identical note from all the powers. The Porte announced that in case Greece rejected the offer it would recall its proposal. The note expressly declared that Greece, if she refused the conditions which the powers had procured on her behalf, and should proceed to enforce her demands with arms, would stand entirely alone and must bear the consequences. Count Mourous, before the reception of the identical note, sought to rob it of a part of its force, and leave the way open for further pretensions to Epirus, by a circular to the powers.

The new boundary-line adopted by the Constantinople Conference commences at the *Ægean* coast a little to the north of Kara Dervent, curves slightly to the southward, and ascends again, striking the line of the Berlin Conference in the vicinity of Telhula, which it follows for 30 or 35 miles in a westerly direction, then trends southward, leaving Mezzovo and Janina on the Turkish side, striking the Arta River, which it follows to its mouth. The fortress of Punta is given to Greece; Prevesa remains in Turkish hands, but its fortifications are to be razed; while the navigation of the Gulf of Arta is to be free. These latter conditions were imposed upon the Porte by the powers. The powers engaged to see that the arrangement was carried out, and the territory given over to Greek possession.

The extent of the ceded territories is about two thirds of the area awarded by the Berlin Conference. It contains 265 geographical square miles. The Turkish official almanac gives the male population of the ceded districts in Thessaly as 20,000 Mohammedans and 150,000 non-Mohammedans, composed of Greeks and Pindus Wallachians, and the male population of the district of Arta as 4,000 Mohammedans and

20,000 non-Mohammedans, the latter consisting of Græco-Wallachians, Pindus Wallachians, and Zinzarians or Macedo-Wallachians. Of the 140,000 Christian inhabitants about 114,000 are of pure Greek blood, 14,000 are of mixed Greek and Wallachian descent, and 12,000 are pure Wallachians. The Mohammedan element is most thickly settled in and about Larissa and Phersala, occupying the most productive portions of the annexed territory. The Wallachians are thickest in the southern parts of the Pindus Mountains, in the northern end of the Arta Valley, and on the southwestern slope of Olympus. The Græco-Wallachians are found everywhere in the border-lands between Greek and Wallachian settlements.

The new boundary-line starts from Kara Dervent, on the Gulf of Salonica, $5\frac{1}{2}$ miles below Platamana, and on the northern edge of the bottom-land at the mouth of the Salambria. It follows the southernmost ridge of the Olympus, passing north of Lividaki Lake and over the heights of Analipsis and Hodaman. From here it takes first a southwesterly direction, crossing the summit of Melna, afterward a southerly one along the Kritiri chain to the Xeria River. Elassona, the industrial town Cherichina, and the mountainous district to the north, which were given to Greece by the Berlin Conference, remain Turkish. The line takes a westerly direction between the Salambria and Xeria Rivers, passing the villages of Flamuristi and Gavronon, and merges in the line of the Berlin Conference five kilometres northwest of the latter place. It diverges from this again in order to leave on the Turkish side the important strategic point of Mezzovo with the Zygos Pass, and is marked by the summits of Mavromuni, Doshimi, and the gigantic Peristeri. It then passes into Epirus, following a mountain creek, the Kalarytes, down to the Arta, near the village of Michalici, and transects the valley of the Arta down to the Ambrakian Gulf. Two thirds of the drainage basin of the Arta fall to the share of Greece. The peak of Actium, or Punta, is on the Greek side, and its fortifications must be dismantled.

The intensest excitement prevailed throughout Greece when the news came that the powers had approved, with some modifications, the boundary-line proposed by the Porte, instead of maintaining the frontier adopted by the Berlin Conference. The "*Æon*" newspaper struck a note to which every heart responded when it called to arms and appealed to the Panhellenic idea:

Europe, which has torn up its own work, may not seem to be the friend and well-wisher of Greece, and philippics are written fulminating wrath, if the will of Europe is defied and its decree set at naught.

But the essence of the matter is, that Europe, even against its will, is on our side, and can not act otherwise than in our favor. Though a thousand protocols and declarations be written down; though warnings, ay threats, be denounced against us, all will vanish like bubbles at the first breath, so soon as we

on our part adopt a firm policy and a manly determination to tread without deviation the path of national duty and of sacred interests. After Turkey has carried her arrogance and her contempt for Europe to the point of dragging Europe to Constantinople to tear up the decision of the Berlin Congress—who will maintain that Greece will be punished by Europe, when Europe has not punished Turkey?

Europe can not come out as our opponent if we proceed to the execution of its own decision, and supplement and complete it if possible. True, no treaty has been signed which guarantees us the alliance of Europe, and we have no protocol which assures us of aid and support in our struggle. But let us not forget that the true international treaties are not those written with ink and paper—the latest treaty, that of Berlin, shows us clearly how much weight written treaties possess. The true treaties of lasting value are the unwritten treaties of national rights and international interests, and these neither personal evils nor diplomatic artifices can destroy or impair. Such true and irreversible compacts subsist between us and Europe, between us and the whole civilized world. Greece represents in the Orient, not conquest, but liberation; not robbery and extortion, but creative effort and peaceful industry; not misery and decay, but progress and liberty.

It was feared that the dissatisfaction of the Greeks at the change in the boundary arrangement would still prevent a peaceful settlement; that they would either reject the offer outright or delay their answer so long that Turkey would withdraw her propositions. Within the proper time Coumoundouros returned, April 7th, a cautiously worded note in which he accepted the promised territory, demanded that the powers should secure its evacuation, and committed the welfare of the Epirotes to the guardianship of Europe, without renouncing the prospects held out by the Berlin decision of the amalgamation of Epirus with Greece. The acceptance of the proffered cession was couched in the following words:

Greece, though pained to see substituted for the decision of the Conference of Berlin another boundary-line, hastens nevertheless to thank the powers for their benevolent interest. She desires to know what term will be set for the occupation, and what guarantee will be offered that the occupation will be accomplished without bloodshed.

The representatives of the powers objected to the form of the acceptance, and on the 13th of April Coumoundouros substituted the following document, which was approved as a formal acceptance of the conditions:

When the Greek Government accepted the serious decree of the Berlin Conference, the Government considered, as it considers to-day, that the decision of the great powers of Europe created rights and obligations affecting both Turkey and Greece, and the inhabitants of the provinces which were awarded to Greece as well as Europe. To-day the great powers come forward to inform Greece that since, through the force of circumstances, the conclusions laid down in the Berlin decision can no longer attain the peaceable fulfillment which the Cabinets had in view, these have instructed their ministers in Greece that they should consider and establish among themselves the boundary-line which best suits the requirements of the situation. The conclusions of the ambassadors, which Europe has adopted and expressly substituted for those of the decree of July 1, 1880, alter in a radical manner the boundary-line of the Berlin Conference; they put in the place of it a new boundary-line, the

main positions on which afford no sort of security and lack every requirement for natural defenses. This line, whose defects must occasion inevitable difficulties in the present and danger for the future, Greece is expected, according to the dispatch which has been received, to accept at once. In regard to this invitation of the powers, Greece could not avoid reflecting as to whether its acceptance would bring the question nearer to a conclusion, whether it would insure the complete, rapid, and peaceful solution of the difficulty. The experience of the past, the fate of the arrangement concluded in Berlin, the effect of the acquiescence expressed by Greece in the conclusions of the conference—all this has not encouraged the Hellenic Government to give an affirmative reply. Hence it is of importance to her to learn when the new decision of Europe shall be carried out; whether the peaceable delivery of the territories ceded to Greece will be effected immediately, or within a stated, brief period; and finally, to be enlightened as to the guarantees which the powers would give that it would take place. The Greek Government is pained to learn that the prospect of a breach of the peace has been sufficient to impel Europe to modify the decision reached in Berlin. Greece would never have supposed that Turkey would refuse to submit to the arbitration of the great powers in such manner as to oppose their firm and unalterable will and expose herself to all the eventualities of a war whose consequences and extent she herself could not calculate. Greece desires peace; she rests in the hope that the great powers will take into serious consideration her appeal to their sense of right, that they will weigh it in the same spirit of good-will which has ever guided them in their decisions upon Greece and the Hellenes. Greece is grateful to Europe for the peaceful solution of the question of the Greek boundaries. She will therefore hasten to take possession of the territories which she is to receive, and to offer all guarantees that may be desired for the benefit of the Mussulmans of the annexed provinces, both with regard to their religion and respect for their rights of property. But though resolved to take the peaceful course which has been pointed out to her by Europe, whose counsels she has at all times been accustomed to respect, Greece believes it to be neither a dignified nor an honorable proceeding on her part toward children who remain on the other side of the new boundary, and whose rights Europe solemnly acknowledged at Berlin, and has repeatedly confirmed, to leave them to their fate.

COUMOUNDOUROS.

As soon as the conditions of the new adjustment were made public, the military ardor of the Greeks abated. In the country demonstrations in favor of war took place, but at Athens the party of Trikonpis as well as the adherents of the Government approved the tranquil acceptance of the situation. There was a party which would have embraced the opportunity afforded by any wavering on the part of Turkey to agitate in favor of breaking off from the agreement. The powers addressed a collective note to the Porte, urging that the terms of the settlement should be drawn in a formal convention without delay. The Greek frontier commission met to arrange the terms of the convention in the middle of May. The convention between the Porte and the powers was concluded and signed at Constantinople, May 24th. The Ottoman delegates on the commission presented stipulations for insuring the religious, civil, and property rights of Mussulmans in the ceded provinces. The Porte demanded among other terms that Mussulman communities should choose their own officials,

that the formalities of the Ottoman law should be observed in the case of any person changing his religion, and that questions of marriage or succession between Mussulmans should be judged by Mohammedan tribunals, which should retain their connection with the Sheik-ul-Islam. Some of the demands were rejected, as not transferring in full sovereignty of the province. The delegates of the powers added to the document the line of the new frontier, and conditions as to the time and mode of evacuation. The transfer of the territory was to begin immediately, under the superintendence of an international military commission. The Turkish authorities proceeded leisurely to prepare for the evacuation. A convention identical in substance with that made with the powers was concluded between the Porte and the Hellenic Government. This document was signed July 2d. The direction of the evacuation was entrusted to Dervish Pasha, the officer who effected the transfer of Dulcigno to Montenegro. Arta was handed over to the Greek authorities on the very last day allowed by the terms. Punta had been evacuated by Hidayet Pasha through a mistake the preceding day, but being reoccupied before the entry of the Greeks a possible collision was averted. There was a considerable exodus of Mohammedans previous to the occupation, but this soon stopped, and many of those who left returned. Excellent discipline was maintained in the occupation by the military of the successive zones evacuated according to the stipulations of the convention, and ready money was paid for all supplies. The Turkish officials had collected the taxes for the current year before leaving. A difference arose between the Turkish members of the commission and the representatives of the powers regarding the delimitation of the new frontier in Thessaly. The latter maintained that the line should run, according to the convention, between Hritiri and Zarko along a crest of hills northward of the Salambria, while the Turkish representatives insisted on carrying it across the river. This was made the subject of a note from the ambassadors to the Porte.

The special Turkish post-office at Larissa was abolished by the Greek Government. The Ottoman Government thereupon addressed a note to the Greek Government demanding that all the Greek post-offices in the Turkish Empire should be closed. The Greek minister to Turkey, Condouriotis, replied that the Hellenic Government maintained separate post-offices in Turkey, the same as the other powers, and under the most-favored-nation clause in the treaty of commerce, whereas the operation of foreign posts in Greece was forbidden by the Constitution.

GUATEMALA (REPÚBLICA DE GUATEMALA), one of the five independent states of Central America, has still to settle the old question of limits with Mexico, and determine the ownership of the territory of Soconusco, which has

long been administered by and regarded as forming a part of the Republic of Mexico. In 1881 Guatemala applied for the friendly intervention of the United States; but Mexico refused to submit to arbitration or even discussion of the question, asserting her right to the disputed territory by option of the inhabitants themselves, and an undisturbed possession for fifty years.

Statistics concerning area, territorial division, population, etc., will be found in the "Annual Cyclopædia" for 1875 and 1880. In the late census returns, published on October 31, 1880, the population of the republic was set down at 1,400,000, against 1,197,054 in 1872; and the population of the capital at 62,186. The civil registry office recorded during the year 1880, 31 marriages; 165 naturalizations; 18 strangers domiciled in the city; 54 men and 69 women recognized as legitimate children; 755 men and 751 women died; and 634 male and 556 female children born. The number of births for the whole republic was 48,927; that of the deaths, 23,346; increase, 25,581.

The President of Guatemala is General Rufino Barrios, elected May 7, 1873, for a period of six years. His term of office was prolonged by decree of the Constitutional Assembly under date of October 23, 1876; and he was re-elected March 15, 1880, for a period of six years. The Cabinet was composed of the following ministers: Foreign Affairs, Dr. Lorenzo Montúfar; Interior, Dr. F. Cruz; War, Señor J. M. Barundia; Public Instruction, Señor Delfino Sanchez; Agriculture, Señor A. Peña; Public Works, Señor M. Herrera.

The Guatemalan Minister to the United States is Señor Don A. Ubico; and the Consul-General (for the Union) at New York, is Señor Don Jacobo Baiz.

The United States Minister to the five Central American republics (and resident in Guatemala) is Dr. Cornelius A. Logan; and the United States Consul at Guatemala City, Mr. J. F. Medina.

The armed force of the republic comprises 2,180 men in active service and 33,229 militia.

The organization of a police force has been reported, under the direction of an ex-police official from New York, who appears also to have been intrusted with the framing of a special code for the regulation of the force.

The report of the Inspector of Public Instruction* for 1880 shows decided progress in educational affairs. In six of the superior institutions of learning the cost to the public Treasury was \$104,393.96, in addition to considerable sums received from pupils and for examinations and degrees. The schools were in a high state of efficiency, increasing attendance, and the appropriations for school funds on a correspondingly higher scale than for any other year. The fostering of education has been one of the constant cares of the Presi-

* See "Annual Cyclopædia" for 1880, p. 850.

dent, and he is well seconded in his efforts by the enlightened zeal of the present Minister of Public Instruction, Don Delfino Sanchez. The "Institutos" of Guatemala and Quezaltenango, and the colleges for females in both towns, are establishments worthy of a progressive government and country. "Belen," with its efficient staff of lady professors, principally foreigners, excites universal admiration for its excellent management and the rapid progress of its pupils. This is the favorite educational establishment, and here the daughters of the leading members of society receive their education, side by side with many who are maintained at the public expense, with the expectation that they will afterward devote part of their time to the education of their less fortunate sisters, as teachers in the public schools that now exist throughout the republic.

The national revenue and expenditures for the year 1879 were as exhibited in the subjoined tables:

REVENUE.

Balance from preceding year	\$21,617
Customs receipts.....	2,510,869
Taxes, etc.....	99,123
Monopolies.....	32,805
Reimbursements, interest, etc	18,869
Loans.....	1,816,228
Deposits.....	64,359
National Bank.....	857,562
Sundries	59,025
Total.....	\$4,584,757

EXPENDITURE.

Administration.....	\$2,728,456
National debt.....	1,000,352
Railways.....	200,000
Reimbursements.....	416,789
Arrears.....	151,781
International Bank.....	1,419
Sundries.....	27,827
Total.....	\$4,526,664
Surplus.....	\$8,903

The national debt was officially reported as follows on January 1, 1880:

Foreign debt.....	\$3,304,966
Home debt.....	4,029,392
Total.....	\$7,334,358

This total shows an increase of \$1,964,829 as compared with the showing for January 1, 1879.

In the annual report of the Corporation of Foreign Bondholders, published in 1881, the statement concerning the Guatemala indebtedment growing out of British loans figured as follows: approximate principal unredeemed, £542,200 (\$2,711,005); total, with overdue interest, £712,392 (\$3,561,960).

We transcribe the following extract from the semi-annual returns of the International Bank of Guatemala for the period ending June 30, 1881; the situation described therein being as satisfactory as the showing of other prosperous banks in larger commercial centers: There are ninety-one subscribers to its funds, who, on a nominal capital of \$910,000, have paid up \$637,000. Cash in hand, \$379,831.17; cash in

agencies, \$70,007.12; bills receivable, \$1,202,825.90; various debtors, \$233,510.63; shares of the Bank of Salvador, \$70,000; United States bonds, \$57,612.50, etc. Bills of the bank circulated to the amount of \$276,652. The reserve has been increased to \$64,000, and the dividend-fund is \$20,686.74. Discounts during the six months footed up to \$2,063,224.70. The exchange business during the six months was profitable, and promises to be still more favorable on account of special advantages obtained for the bank in Europe, by Mr. J. F. Medina, the former manager. The net profits of the concern were \$66,050.52 for the six months, out of which a dividend of \$500 per share was paid, or at the rate of over 14 per cent per annum on the paid-up capital of the bank.

The exports and imports, with the destinations and sources thereof respectively, were as follows for 1880:

EXPORTS.

DESTINATION.	Value.
Great Britain.....	\$85,000
United States.....	1,776,060
France.....	727,000
Germany.....	560,000
Various.....	227,000
Total.....	\$4,425,000

IMPORTS.

SOURCES.	Value.
Great Britain.....	\$1,037,000
United States.....	645,000
France.....	536,000
Germany.....	425,000
Various.....	392,000
Total.....	\$3,035,000

The quantity and destinations of the coffee exported in 1880 were as below:

		Lbs.
Great Britain.....		5,907,600
France.....		5,038,854
Germany.....		5,322,202
United States	{ New York... 3,125,155	11,835,006
	{ San Francisco 8,143,421	
Baltic.....		246,585
South America.....		355,858
Belgium.....		171,850
Italy.....		40,850
All other destinations.....		12,522
Total.....		25,976,267

The imports from the United States were as follows in 1880: from New York, \$141,591.43; from California, \$502,995.26; from New Orleans, \$11,367.12; total, \$656,913.81. The exports to the United States, in the same year, were of the total value of \$1,776,214.70.

The work on the branch of the railway from Escuintla to the capital had been commenced; and a concession for the construction of a line from Santo Tomás, on the Atlantic coast, had been granted to Larrondo Brothers; distance, 240 miles; estimated cost, \$14,000,000. This new line, if built, will materially facilitate our trade with Guatemala, there being already a line of steamers plying between New Orleans and Livingston, near Santo Tomás.

Guatemala is now in the Postal Union.

GUITEAU'S TRIAL. Within a few days after the death of President Garfield proceedings were begun in the District of Columbia for bringing his assailant to trial on a charge of murder. At first a question of jurisdiction was raised, the death of the victim having occurred in the State of New Jersey. The opinion was expressed that the rule of the common law prevailed in the District, and that its courts could not have jurisdiction in a case of murder unless the death as well as the criminal act occurred within its boundaries. There was no doubt that the courts of New Jersey would have jurisdiction, inasmuch as the statute law of that State provided that both in the case of death within its limits from criminal injury caused elsewhere, and injury within its limits resulting in death elsewhere, indictment could be found and tried in the county within which either the death or the injury took place. At the request of Judge E. W. Scudder, of the Supreme Court of New Jersey, Attorney-General Stockton considered the question of the proper action to be taken in that State. He wrote to District-Attorney Corkhill, of the District of Columbia, stating that he should not advise any legal proceedings to be taken in New Jersey with a view to the punishment of the crime of Guiteau, unless he should be informed that it could not be punished under the jurisdiction of the courts of the Federal District. The District Attorney replied that he had no doubt that the law in force there would be found adequate to meet the case. Judge Scudder accordingly, on the 4th of October, charged the Grand Jury of Monmouth County that it would not be advisable or necessary "to take any action in this matter at the present time, unless we shall be notified that the prosecution and indictment of the offense in this county are required to prevent a failure of justice, which does not now appear probable, according to the statement made by the proper legal authority of the city of Washington."

The case had by this time been already brought before the Grand Jury of the District of Columbia on the evidence of Surgeon-General Barnes, who testified in relation to the wound; George W. Adams and Officer Kearney, who witnessed the shooting; and Dr. D. S. Lamb, who conducted the autopsy of the President's body. The presentment of the jury was made on the 4th of October, the indictment was found in due form a few days later, and on the 14th of October the prisoner was arraigned in court to plead to the indictment. In the mean time he had caused to be printed in one of the public journals a statement of facts and an explanation of his motives. In this he gave a long account of his career, his participation in the political canvass of 1880, and his efforts to obtain an appointment at the hands of the new Administration. He said:

My conception of the idea of removing the President was this: Mr. Conkling resigned on Monday, May 16,

1881. On the following Wednesday I was in bed. I think I retired about eight o'clock. I felt depressed and perplexed on account of the political situation, and I retired much earlier than usual. I felt wearied in mind and body, and I was in my bed about nine o'clock, and I was thinking over the political situation, and the idea flashed through my brain that if the President was out of the way everything would go better.

He then proceeded to give a detailed account of his preparation for the crime and of its execution, claiming that he was under a divine pressure which he could not resist. In regard to the legal aspect of the case and his defense, he said:

I shot the President without malice or murderous intent. I deny any legal liability in this case. In order to constitute the crime of murder two elements must co-exist. First, an actual homicide; second, malice—malice in law or malice in fact. The law presumes malice from the fact of the homicide; the degree of malice depends upon the condition of the man's mind at the time of the homicide. If two men quarrel and one shoots the other in heat or passion, the law says that is manslaughter. The remoteness of the shooting from the moment of its conception fastens the degree of the malice. The further you go from the conception to the shooting the greater the malice, because the law says that in shooting a man a few hours or a few days after the conception the mind has a chance to cool, and therefore the act is deliberate. Malice in fact depends upon the circumstances attending the homicide. Malice in law is liquidated in this case by the facts and circumstances, as set forth in these pages, attending the removal of the President. I had none but the best of feelings, personally, toward the President. I always thought of him and spoke of him as General Garfield.

At the request of the accused, his brother-in-law, George M. Scoville, of Chicago, took charge of his defense. Attempts to secure the aid of prominent lawyers, including R. T. Merrick, of Washington; Emory A. Storrs, of Chicago; and B. F. Butler, of Massachusetts, were unsuccessful, though Mr. Merrick expressed his willingness to argue the question of jurisdiction, if it were made an issue in the case. On his arraignment the prisoner pleaded "Not guilty," and desired to make a statement, but the privilege was denied, as not appropriate at that time. In arguing for a delay of the trial, Mr. Scoville stated that the defense would consist of two points: First, the insanity of the defendant; and, second, that the wound was not necessarily mortal, and was not the cause of death. The time of trial was fixed for November 7th, and it was intimated that there might be a preliminary consideration of the question of jurisdiction. This was not had, however, as the plea of "Not guilty" waived for the time the objection on this point. Subsequently Judge Cox, of the Criminal Court, assigned Mr. Leigh Robinson to be associate counsel for the defense; and Mr. Walter D. Davidge, of Washington, and John K. Porter, of New York, were employed to assist in the prosecution. A motion for the postponement of the trial to November 21st resulted in its being set down peremptorily for the 14th of that month. In the mean time an order was obtained from the

court permitting the summoning of twenty witnesses for the defense, at the expense of the Government.

On the first day set for the trial, lack of harmony appeared between the counsel for the defense. Mr. Robinson applied for a postponement, on the ground that he was not fully prepared, and was endeavoring to obtain additional legal aid. Mr. Scoville objected to his proceedings, declaring that he had not been consulted in the matter; and the prisoner violently demanded that Mr. Robinson "get out of the case." The prisoner also attempted to deliver an address to the court, but was not permitted to do so. The address was, however, published, and contained a reiteration of his motives in "removing the President," to save the Republican party, and prevent a new civil war; and of his claim that he was inspired by the Deity, and compelled to the performance of the act. No postponement was granted. After the jury-panel had been sworn, Judge Cox made the following observations regarding disqualifications for the required service:

Under the Constitution, the prisoner is entitled to be tried by an impartial jury. But an idea prevails that any impression or opinion, however lightly formed or feebly held, disqualifies from serving in the character of an impartial juror. This is an error. As the Supreme Court says: "In these days of newspaper enterprise and universal education, every case of public interest is almost as a matter of necessity brought to the attention of all the intelligent people in the vicinity, and scarcely one can be found, among those best fitted for jurors, who has not read or heard of it, and who has not some impression or some opinion in respect to its merits." If the prevalent idea I have mentioned were correct, it would follow that the most illiterate and uninformed people in the community would be the best qualified to discharge duties which require some intelligence and information. It is now generally, if not universally, agreed that such opinions or impressions as are merely gathered from newspapers or public report, and are mere hypothetical or conditional opinions, dependent upon the truth of the reports, and not so fixed as to prevent one from giving a fair and impartial hearing to the accused, and rendering a verdict according to the evidence, do not disqualify. On the other hand, fixed and decided opinions against the accused, which would have to be overcome before one could feel impartial, and which would resist the force of evidence for the accused, would be inconsistent with the impartiality that the law requires. There is a natural reluctance to serve on a case like this, and a disposition to seek to be excused, on the ground of having formed an opinion, when in fact no real disqualification exists. But it is your duty, as good citizens, to assist the court in the administration of justice in just such cases, unless you are positively disqualified, and I shall expect you on your consciences to answer fairly as to the question of impartiality, according to the explanation of it which I have given to you.

Three days were occupied in obtaining the jury, which was constituted as follows: John P. Hamlin, restaurant-keeper; Frederick W. Brandenburg, cigar-dealer; Henry J. Bright, retired merchant; Charles J. Stewart, merchant; Thomas H. Langley, grocer; Michael Sheehan, grocer; Samuel F. Hobbs, plasterer; George W. Gates, machinist; Ralph Wormley (colored), laborer; W. H. Brawner, commission-

merchant; Thomas Heinlein, iron-worker; Joseph Prather, commission-merchant.

On the day on which the jury was completed the prisoner, who claimed to be acting as counsel in his own defense, succeeded in having an appeal for aid "to the legal profession of America" published, in spite of the objection of Mr. Scoville.

The case for the prosecution was opened by District-Attorney Corkhill, on the 17th of November. He detailed to the jury the facts relating to the crime, and endeavored to show that it was planned and executed as the result of political disappointment, and for the purpose of revenge. In regard to the question of motives and purposes, as bearing on the legal aspects of the crime, he said:

The unlawful killing of any reasonable creature by a person of sound memory and discretion, with malice aforethought, either expressed or implied, is murder. The motives and intentions of an individual who commits a crime are of necessity known to him alone. No human power can penetrate the recesses of the heart; no eye but the eye of God can discern the motives for human action. Hence the law wisely says that a man's motives shall be judged from his acts, so that if one kill another suddenly, without any provocation, the law implies malice. If a man uses a deadly weapon, it is presumed he intended to commit murder, and in general the law presumes a man to intend the natural consequences of his act. Were there nothing more against the accused than the occurrences of the morning of July 2d, the evidence of his crime would be complete, and you would be authorized to conclude that he feloniously, willfully, and with malice aforethought, did kill and murder James A. Garfield. But crime is never natural. The man who attempts to violate the laws of God and society goes counter to the ordinary course of human action. He is a world to himself. He is against society, against organization, and of necessity his action can never be measured by the rules governing men in the everyday transactions of life. No criminal ever violated the laws who did not leave the traces of his crime distinct and clear when once discovered. So in this case we can only add to the enormity of this offense by showing you its origin, its conception, and the plans adopted for its execution.

On the same day Secretary Blaine and Señor Simon Comacho, Minister from Venezuela, were examined as witnesses of the act of shooting. Mr. Blaine was also examined with reference to the prisoner's persistent and unsuccessful application for office previous to his alleged conception of the crime. The next day was occupied with further testimony of eye-witnesses of the shooting, and the examination of the private secretary of the late President in regard to the efforts of the accused to obtain an appointment to office. Several letters relating to the application were put in evidence. In some of these the prisoner expressed his dissatisfaction with the conduct of Mr. Blaine, accused the latter of working for his own nomination for the presidency in 1884, and promised the President his influence and support for a renomination. He also intimated that the course of Mr. Blaine threatened to bring disaster to the Administration. The next two days were occupied with medical testimony in regard to the President's injury and its treat-

ment. The doctors who first examined the wound and attended the President throughout his illness gave their testimony, and Dr. Bliss was closely cross-examined in regard to the mode of treatment. The joint of the vertebral column which was perforated by the bullet was exhibited in court, and the character of the wound was fully explained, as well as the details of its treatment by the physicians. The part of the cross-examination intended to show maltreatment was strenuously objected to by the prosecution, and by agreement the doctors' record was submitted to the counsel for the defense. Dr. Bliss's last answer on the witness-stand was that the wound itself was necessarily mortal. On the 18th of November there was a somewhat exciting episode in an attempt to shoot the prisoner while on his way from the court to the jail in a van. A man on horseback followed the vehicle for some distance, and then riding rapidly past fired a pistol into it. The bullet grazed the prisoner's wrist, but did no serious injury. The assailant escaped at the time, but a man named William Jones was subsequently arrested, indicted for the assault, and released on bail.

The second week of the trial opened on the 21st, with a completion of the medical testimony in regard to the injuries of the deceased, and this concluded the presentation of the case on behalf of the prosecution. The same day Mr. Robinson withdrew from the case, in consequence of discord between himself and the other counsel, and the opening for the defense was begun. An opportunity was first given the prisoner to speak in his own behalf, but he merely made a few remarks, saying that he thought the true way for him was "to interject statements as the case proceeds." Mr. Scoville's address, which was begun November 21st, and occupied the whole of the next day and part of that which followed, was devoted to setting forth the defense of insanity, on which alone he relied. He gave an account of the Guiteau family, with a view of showing an hereditary taint, and detailed the career of the prisoner, his early training, peculiar religious views, experience as a member of the Oneida Community, efforts as a practicing lawyer and a lecturer on theological subjects, his projects for establishing newspapers, and his extravagant political aspirations. He claimed that all this tended to show insanity, and would be duly proved. On the 23d of November testimony for the defense began. The proceedings were constantly interrupted by the prisoner, who contradicted the witnesses and criticised the course of counsel. Intimations of gagging and of removal from the court-room failed to repress him. On the second day of the examination of witnesses for the defense he read a statement in which he said:

I propose to have all the facts bearing on this case to go to the court and the jury, and to do this I have been forced to interrupt counsel and witnesses who

were mistaken as to supposed facts. I meant no discourtesy to them or to any one. Any fact in my career bearing on the question who fired that shot, the Deity or myself, is of vital importance in this case, and I propose that it go to the jury. Hence my personal, political, and theological record may be developed. I am glad that your Honor and the opposing counsel are disposed to give an historical review of my life, and I ask the press and the public to do likewise. All I want is absolute justice, and I shall not permit any crooked work. I have no idea my counsel want crooked work. They are often mistaken in supposed facts, and I shall have to correct them. Last spring certain newspapers in New York and Washington were bitterly denouncing the President for breaking up the Republican party by improper appointments. I would like those newspapers to reprint those editorials now, and see how they would look and sound. In attempting to remove the President, I only did what the papers said ought to be done. Since July 2d they have been deifying the President, and denouncing me for doing the very thing they said ought to be done. I want the newspapers and the doctors, who actually killed the President, to share with me the odium of his death. I never would have shot him of my own volition, notwithstanding those newspapers, if I had not been commissioned by the Deity to do the deed. But this fact does not relieve the newspapers from the supposed disgrace of the President's removal. If he had been properly treated, he would have been alive to-day. It has been published that I am in fear of death. It is false. I have always been a religious man and an active worker for God. Some people think that I am a murderer, but the Lord does not, for he inspired the act, as in the case of Abraham and a score of other cases in the Bible.

Several days were occupied with testimony relating to the family and personal history of the accused, which was intended to sustain the theory of an hereditary tendency to insanity and the progressive development of mental aberration in the prisoner himself. He was placed on the witness-stand to testify in his own behalf on the 29th of November, and examined for four days. Before he began his testimony, several of his letters to different members of his family were read and put in evidence. The prisoner, in response to questions of his counsel, gave a detailed account of his own recollection of incidents in his past life, his early training, religious views, experience as a member of the Oneida Community, which he was induced to join by his father, and his subsequent efforts as a lecturer, a lawyer, and a politician. He also gave an account of his conception of the idea of removing the President in order to heal the breach in the Republican party and save the nation from peril, claiming to have acted under inspiration and divine "pressure." He was subjected to a severe cross-examination, under which he was sometimes rather violent in his language and gesticulations, but generally very skillful in adhering to his theory of the crime, and in meeting the advances of the questioning counsel. The purpose of the prosecution was to show that his "conception," as he called it, followed closely upon his final disappointment in his quest for office, and was accompanied by indications of a desire for revenge; also that a desire for notoriety entered into his motives. The testimony of the accused was concluded

on the 2d of December, and was followed by evidence intended to show the political situation prior to July 2d, which was assumed to have been an exciting cause upon the mind of the prisoner to impel him to his act of that date.

The fourth week of the trial opened on the 5th of December, with the introduction of expert testimony on the part of the defense to prove insanity. The following hypothetical question, based on the facts which the defense assumed as having been developed by the previous testimony, was propounded to the witnesses by Mr. Scoville:

Assuming it to be a fact that there was a strong hereditary taint of insanity in the blood of the prisoner at the bar; also, that at about the age of thirty-five years his own mind was so much deranged that he was a fit subject to be sent to an insane asylum; also, that at different times after that date during the next succeeding five years he manifested such decided symptoms of insanity, without simulation, that many different persons conversing with him, and observing his conduct, believed him to be insane; also, that in or about the month of June, 1881, at or about the expiration of said term of five years, he became demented by the idea that he was inspired of God to remove by death the President of the United States; also, that he acted on what he believed to be such inspiration, and on what he believed to be in accordance with the divine will in the preparation for and in the accomplishment of such a purpose; also, that he committed the act of shooting the President under what he believed to be a divine command, which he was not at liberty to disobey, and which belief made out a conviction which controlled his conscience and overpowered his will as to that act, so that he could not resist the mental pressure upon him; also, that immediately after the shooting he appeared calm and as if relieved by the performance of a great duty; also, that there was no other adequate motive for the act than the conviction that he was executing the divine will for the good of his country—assuming all of these propositions to be true, state whether, in your opinion, the prisoner was sane or insane at the time of shooting President Garfield?

The first of the expert witnesses, Dr. James G. Kiernan, of Chicago, replied to this question, that, assuming these propositions to be true, he had no doubt of the prisoner's insanity. On cross-examination the witness expressed a belief in the existence of moral insanity, and stated the opinion that about one person in five in the community was more or less insane. Dr. Charles H. Nichols, of the Bloomingdale Asylum, New York, and Dr. Charles F. Folsom, of Boston, also testified that, assuming the statements in the hypothetical question to be true, the person described would, in their opinion, be insane. Dr. Samuel Worcester, of Salem, Massachusetts, insisting on an explanation of the question, was set aside as a witness for the defense. Dr. W. W. Golding, of Washington; Dr. James H. McBride, of Milwaukee; and Dr. Walter Channing, of Brookline, Massachusetts, also testified that, assuming the propositions of the question to be all true, they should regard the prisoner as insane. Dr. Theodore W. Fisher, of Boston, replied, "I should dislike very much to be confined to that statement of facts, but if I am obliged to

answer that question I should say he was insane." This concluded the medical testimony for the defense, and was followed by the reading of passages from a book written by the prisoner and entitled "Truth," and by the evidence of two or three public men who had been acquainted with the political doings of the accused. The prisoner himself petulantly criticised the theory and conduct of his counsel, and desired to have President Arthur, General Grant, ex-Senator Conkling, and other prominent public men summoned, as well as the editors of several leading newspapers. At the opening of the court on December 7th, he made the following statement:

May it please your Honor, the American people do not desire that this case shall be tried again, and I do not desire it. I say, with the utmost respect to this court and jury and my counsel, Mr. Scoville, that I am not satisfied with the political situation as developed in this case. That is the gist of the alleged offense. The President of the United States would never have been shot if it had not been for the political situation as it existed last May and June, and I say I have a right, as a matter of law, appearing as my own counsel, to ask your Honor that General Grant, Senators Conkling and Platt, and President Arthur and those kind of men, who were so down upon Garfield that they would not speak to him on the street, and would not go to the White House—I have a right to show that—I have a right to show my personal relations to those gentlemen; that I was on friendly terms with them; that I was cordially received, well dressed, and well fed at the Fifth Avenue Hotel by the National Committee. I want to show my supposed personal relations to those men. I do not want to take exception to your Honor's ruling, but I shall be obliged to do so. I have no doubt that the court in banc will give me a new trial.

The same day the rebutting testimony of the prosecution was begun, with the understanding that Dr. Spitzka, of New York, who had been summoned for the defense as an expert and had not yet appeared, might be examined at a later stage of the proceedings. Three days were occupied with evidence in rebuttal of that which was intended to show insanity in the Guiteau family, and in support of the theory that the prisoner was simply depraved and wicked, having been addicted to cheating, hypocrisy, and vice, and possessed with an inordinate vanity and desire for notoriety.

On the opening of the fifth week, December 12th, Dr. Spitzka appeared and was examined for the defense. He testified that he had made a personal examination of the prisoner, and believed him to be insane, "a moral imbecile, or rather a moral monstrosity." He was subjected to a severe cross-examination, intended to discredit his authority as an expert. On the 13th the prosecution began the introduction of expert testimony in rebuttal of that of the defense. The first witness of this class was Dr. Fordyce Barker, of New York, who testified that there was no such thing as hereditary insanity, though there might be a transmitted liability to become insane, and that in his opinion what was termed moral insanity was nothing but wickedness. The general purport of his testimony was that in Guiteau's case

there was no indication of the kind of delusion or irresistible impulse which could denote genuine insanity. He was followed by several lay witnesses, who testified to various transactions and experiences showing the depraved character of the accused. Dr. Noble, of the Washington jail, testified to the prisoner's conduct in jail, and believed him to be perfectly sane. General Reynolds, of Chicago, gave an account of an interview with the prisoner on the 14th of July, at which the latter expressed his astonishment that his act was denounced by prominent "stalwart" Republicans from whom he had expected protection. An attempt was made to show that the idea of inspiration originated after the prisoner found that there was no hope that he would be shielded by the faction who, in his view, had benefited by his act. Among the witnesses was a Mrs. Dunmire, who had been married to the defendant, and had obtained a divorce in 1874, on the ground of adultery. She had no reason to believe him insane. The expert testimony as to what constituted insanity was then resumed, the judge ruling, in response to an objection by the defense, that there was no reason, while one witness was testifying, for excluding the others from the court-room. Dr. Francis D. Loring, of Washington, and Dr. Allan McLane Hamilton, of New York, were examined on the 16th of December. The proceedings were interrupted from that date until the 21st on account of the death of the wife of a juror, who was permitted to go home for three days under an injunction to himself and his associates to hold no communication with other persons in regard to the trial. In this interval a cast of the prisoner's head was made by Mr. Theodore A. Mills, assisted by his father, Clark Mills, which it was the intention of the defense to introduce as evidence. The measurement of the head, according to a statement of Mr. Mills, was 23½ inches in circumference, "self-esteem 6½, firmness 6½." The development of the left side was said to be normal, while the right was almost flat.

Dr. Hamilton's testimony was continued on the 21st of December; and Dr. Worcester, who had been originally summoned for the defense, was called by the prosecution. The facts assumed by that side, as established by evidence, were summed up in the following hypothetical question addressed to the witness:

First hypothesis: Assume a man forty years of age, in good health, who has always enjoyed good health, and who had never been seriously ill during the whole of his life, but that for some time previous to his birth his mother was an invalid; that one paternal uncle was an inmate of an insane asylum and died there, the alleged cause of the insanity being disappointed affection and mortification after fighting a sham duel; that another uncle was of dissipated and dissolute habits, and two first-cousins were of unsound mind; that he was brought up under the care of his father, who was a man of earnest religious belief, and who enjoyed a high character for honesty, integrity, uprightness, candor, and excellent business qualifications, and who was, from time to time, for many

years, elected to public positions of trust and responsibility, and who was, at the time of his death and for twelve years preceding, the cashier and virtually the business manager of a national bank. Suppose a son at the age of nineteen years, while pursuing studies at a school preparatory to entering a State university, abandoning his studies at the solicitation of his father, and entering into and becoming a member of the Oneida Community; suppose him to continue a member of that Community, conforming himself to the regulations and practices of the community for a period of five years, at one time leaving the Community for a period of some months to visit New York and other places, and then voluntarily returning to the Community and remaining the additional period of one year, at the end of which time, becoming dissatisfied with the labor there assigned him, he finally withdrew from the Community by the advice and with the pecuniary aid of a brother-in-law. Assume that after reflection on the subject in the Community he went to New York city, contemplating the establishment of a daily journal to be called "The Theocrat," and to be devoted to the dissemination of the peculiar religious belief of that Community, but abandoned the project without commencing its publication, for the want of pecuniary assistance and encouragement. Assume that he studied law, was admitted to the bar, and practiced his profession in Chicago and New York, was married, and divorced by his own procurement; that growing interested in religious matters he devoted himself to the preparation of lectures upon theological subjects, which he delivered in various parts of the country; that during the period of time when he was thus engaged he visited the home of a sister; that while there his sister said he raised an axe as though he would strike her, which he denied, and that the family physician summoned by her, after an examination in which he could find neither illusion, hallucination, delusions, nor disturbance of the intellectual or perceptive force, said he was insane "because of exaltation of the emotions and explosions of emotional feeling, also excessive egotism," and that he was the subject of an intense pseudo-religious feeling, and advised that he be taken to an insane asylum, which advice was not followed, and he was not then or at any subsequent time confined in a lunatic asylum, and that this statement was without any evidence except that of the sister and the physician hero stated. Assume that after this he again traveled about the country, delivering his lectures and selling printed copies of the same, but that the views contained in these lectures not meeting the concurrence of his audience and popular favor, he did not derive pecuniary success and abandoned that enterprise. Assume that during a presidential political campaign he associated himself with the National Republican Committee and prepared a speech which was delivered but once, the reason assigned by him being that he was not sufficiently prominent to attract the attention that the members of the National Committee thought necessary in that campaign. Assume that at the close of the campaign he asked General Garfield by letter for the position of Minister to Austria. Assume that, after the inauguration of President Garfield, this man came to the city of Washington, D. C., and again made application for the Austrian mission, but learning that another person had been appointed to this place withdrew his application for it and applied for the position of Consul to Paris, for which place he pressed his application with great persistence, but not more than is usual with many persons asking for similar positions; that he earnestly and persistently followed up his application for this place by verbal and written requests, having no special claims for the position except his own idea of the value of his services to the party in the presidential campaign, and having no recommendation signed by any prominent politician for the place, his only recommendation being that of one Charles H. Reed, of Chicago, who had signed his application for that office. Assume that he

was told by Secretary Blaine, some time about the middle of May, in decided terms never to speak to him again about the Paris consulship as long as he lived; that persisting in his application he said to Mr. Blaine, "I will see the President, and ask him to remove Mr. Walker," the then incumbent, and that he understood Mr. Blaine to reply, "Well, if Sewell will indorse your application I have no objection to your having the place"; and that he inferred from this answer that if President Garfield would remove Mr. Walker, Mr. Blaine would not object to giving him the position; that he then applied to President Garfield to give him the Paris consulship, and made appeals to prominent politicians in Washington to aid him in this enterprise, and believed that they intended themselves to help him to forward his application; that he finally thought he would have the matter about the Paris consulship settled one way or the other, and addressed a note to the President in which he said, among other things, "Can I have the Paris consulship?" that he was informed, as he had been before repeatedly, that "the President could not see him to-day." Assume that four days after his alleged conception of the idea of removing the President he wrote to the President; that he dwelt upon this subject for two weeks, and at the end of this time, on or about June 6, 1881, he inquired of a dealer in guns and pistols for the largest caliber, strongest force, and most accurate pistol made; that two days thereafter he returned and purchased that pistol, having in the mean time borrowed money to pay for it; that after purchasing the pistol he inquired as to where he might practice with it; was informed that he could practice with it outside the city limits, and went outside the limits on three occasions, firing ten shots each time and hit the mark; that he followed the President from time to time for the purpose of shooting him—once to a church, which he examined for the purpose of shooting the President through a window, once to a depot, but the sight of a sick wife clinging to the President's arm prevented him from shooting him then, and once followed him to the house of a friend, and while the President was in the house concealed himself in an alley where he examined his pistol, intending to shoot him when he came out; but when he did come out he was accompanied by his friend, and they walked arm in arm closely together, so that he could not shoot him then; that finally, on the 2d day of July, 1881, he arose in the morning, took his pistol and took a walk in the park, then took breakfast, went to a depot, where he was informed by the newspapers, and had ascertained, the President would be at about the hour of nine o'clock in the morning, and that going there before this hour he waited for the President, and before his arrival left a bundle of papers at the news-stand addressed to Byron Andrews and his co-correspondents of newspapers; that he went into a water-closet, took out his pistol and examined it; that he went outside the depot, had his boots blacked and inquired for a hackman whose services he had engaged two weeks previous, but, he not being there, he engaged another hackman, agreeing with him for a stipulated price, conditioned that he should drive rapidly in the direction of the Congressional Cemetery, which was near the jail; that he saw the President arrive at the depot in a carriage with a friend, which he recognized as the carriage of the friend and not the carriage of the President; that he saw him in earnest conversation with his friends and waited until the President alighted from the carriage and walked into the depot a few feet; then, approaching the President from behind in a manner which did not attract the President's attention, when within a few feet of the President aimed the pistol at the hollow of his back and fired upon him twice, intending to kill him, and inflicting a mortal wound. Assume that after the shooting he made an effort to reach the carriage he had previously engaged, with a view to get to the jail as rapidly as possible, and thereby avoid the appre-

hended fury of the populace; that he was intercepted by an officer while endeavoring to reach his carriage; that he had written a letter to General Sherman, which was in his hand when intercepted by the officer, and which, he said, he was anxious to reach the general at once, and which was found to contain a demand for troops to protect him from mob violence, which he greatly feared. Assume that some time in the month of June, 1881, he wrote a letter in which he uses this language: "I have just shot the President; his death was a political necessity, because he proved a traitor to the men who made him, and thereby imperiled the life of the republic"; that in another letter, dated June 20, 1881, he used the following language: "The President's nomination was an act of God, his election was an act of God, his removal is an act of God"; that in a document addressed "To the American People," and dated as early as June 16, 1881, he used this language: "I conceived the idea of removing the President four weeks ago. I conceived the idea myself and kept it to myself"; that in the same document he says, "In the President's madness he has wrecked the once grand old Republican party, and for this he dies." And again: "This is not murder; it is a political necessity." Assume that he now claims that on several occasions during his life he has claimed to be inspired—once in connection with his entering the Oneida Community; once preceding his attempt to establish "The Theocrat"; once in connection with the writing of his lectures and his book, "The Truth," and that subsequent to the attempt to procure office, and some time after the shooting of the President, while in confinement in jail and awaiting trial, he said that he was inspired by the Deity to do that act, and said that the idea came to him one night about the 18th of May, which was about five days after the interview with Secretary Blaine about the Paris consulship, in which he was told by Secretary Blaine never to speak to him about the Paris consulship again, and after again visiting the White House and being refused admission, that he struggled against the idea, but that he finally worked himself up to it and nerved himself to do the shooting. Assume that for years previous to the shooting he procured a precarious living, often leaving his board-bills unpaid, borrowing money and going from place to place on the railroads, evading, when he could, the payment of the usual railroad fare; that on two or three occasions he was arrested for not paying his board-bills, and that he was once arrested and placed in the Tombs in New York city, and was once confined in jail in the city of Chicago for retaining money collected by him which did not belong to him. Assume that under oath, as a witness in his own behalf on trial for murder, he said he felt remorse so far as his personal feelings were concerned, and regretted the necessity for the act, but said he claimed that his duty to the Lord and to the American people overcame his personal feelings and personal regrets as to the act.

Second hypothesis: Suppose that in addition to the foregoing it is shown that this man went from place to place leaving unpaid board-bills behind him; that he borrowed money on false representations, using the names of prominent men as references without their knowledge or consent to secure the money; that he abandoned his practice of the profession of law, as he said it did not pay, and went to lecturing on theological subjects in imitation of prominent evangelists who, he said, had made money; that while he was professing religion and a church-member he was guilty of deception and lasciviousness; that in the character of a Christian gentleman he traveled through the country borrowing money and contracting indebtedness for his personal support, which he seldom if ever paid, though profuse in promises, evasions, and misrepresentations; that he published a book called "Truth," a large part of which was stolen from a book published many years before, called "The Berean"; that he represented and sold this book

"Truth" as his own literary production and ideas; that, failing in this, he returned to the practice of law and collected money for clients, which he retained; that he associated himself with the Young Men's Christian Association, had his letters addressed in their care, and used his relations with them as a passport to secure confidence, which he grossly abused; that he fraudulently obtained money by burnishing an oroid watch and passing it off for gold, and boasted of it; that he declared that he would secure notoriety by good or evil, even if he had to kill some prominent man and imitate Wilkes Booth; that as far back as 1872 he took part in the Greeley campaign, declaring that he expected by so doing to secure the Chilian mission; that in order to procure a divorce from his wife, who had labored for him and sent money to him for his support, although he was at the time a lawyer and officer of the court, he yet deliberately, in accordance with his own statement, committed adultery with a prostitute, and appeared as a witness against himself in the divorce proceedings by which a decree of divorce was granted against him; that during his married life, while a member of the church and professing religion and engaging in the public exercises of the church with which he was connected, he got his wife to borrow money from the pastor, and afterward was accused of immoral conduct and vicious and dishonest practices, and in addition to having a loathsome disease he admitted the truth of the accusation; that he went again into politics, because neither the law nor theology would pay; that he used each and all the schemes he undertook, which have been presented as evidences of his insanity, for the purpose of dishonestly obtaining money; that during the political campaign of 1880 he wrote a speech which was delivered but once; that on this speech and his so-called services in the campaign he claimed and asked for an important foreign appointment, and for that purpose came to Washington; that immediately before coming to Washington he was getting a precarious subsistence in New York by soliciting life insurance; that in order to get to Washington he borrowed ten dollars, and arrived in Washington without funds; that he stopped at the Ebbett House one day, and left without paying his bill; that he went from one boarding-house to another in Washington, leaving the board-bills unpaid in each, and falsely representing that he was expecting money and would soon pay; that he borrowed fifteen dollars from a friend, stating that he wanted money to pay a board-bill, but really used it to purchase a pistol with which to shoot the President of the United States; that he boarded at a respectable house in the city of Washington for more than five weeks, leaving it only two days before the shooting, and only then because the landlady demanded payment for board, which he promised to pay in a few days, but which was never paid; that during this time he was on friendly relations with his fellow-boarders, conversing with them daily at the table upon religious and general topics, attending church, reporting and discussing sermons with the pastor, as well as the revision of the New Testament, and the situation as represented by the senatorial contest at Albany, and exhibiting nothing unusual in his manners, conduct, or conversation; that while stopping at this house he followed the President on at least two occasions for the purpose of shooting him, once watching him from Lafayette Park, but seeing him ride out with several friends desisted from shooting him; that once he followed him to the depot, but seeing a sick wife leaning on his arm refrained from shooting on that occasion, and that during all this time he never mentioned the subject of inspiration, or that he had any extraordinary relation with the Deity, or had any divine commission to perform; that he went to the Riggs House the day before the shooting, and left that board-bill unpaid; that, failing to secure the offices he sought, and disappointed in the expectations which he had frequently said he confidently entertained, he

followed the President from place to place, seeking the opportunity to shoot him; and finally, learning that the President was to go to Long Branch on a certain day, he went to the railway-station to waylay him, and there, stealthily approaching him from behind, treacherously murdered him by shooting him in the back; that, arrested and charged with this crime, he justified it as a patriotic act and claimed that it was a political necessity, and that the President was guilty of the blackest ingratitude by going back on the men who made him; that by removing the President he took but the life of one man, which cemented the Republican party and prevented another war which might have cost thousands of lives, as our last war did, and that the prominent men connected with the Republican party whom he supposed would be benefited by his crime would protect him from the consequences of his act; that when he learned that these men had expressed their abhorrence of his crime he appeared to be "struck dumb" and in "great mental agony," and after collecting himself he repeatedly used the words, "Most astounding!" and exclaimed: "What does it mean? I would have staked my life that they would defend me," and again repeated the words "Most astounding," and that shortly thereafter he, for the first time, used the words or expressed the idea of "inspiration" in referring to his crime; and that only since that time has he claimed "inspiration" as a defense for the murder. Assuming all these propositions to be true, I will ask you to state whether in your opinion the person was sane or insane at the time of shooting President Garfield?

The reply of the witness was that, in his opinion, the prisoner was sane. When asked on cross-examination what had changed his opinion as to the sanity or insanity of the prisoner, Dr. Worcester replied: "Mainly his own testimony, and my interview with him in the jail, supported by the evidence which I heard." On the following day, Dr. Theodore Damon, of Auburn, New York, was examined, and, in response to the hypothetical question and other inquiries, expressed the opinion that the prisoner was sane. On the 23d Mr. Charles H. Reed, of Chicago, joined the counsel for the defense, in spite of some criticism on the part of the prosecution, Judge Cox stating that he saw no impropriety in his doing so, notwithstanding the fact that he had been a witness in the case. The same day two more expert witnesses—Dr. S. H. Taicott, of Middletown, New York, and Dr. Henry P. Stearns, of Hartford, Connecticut—were examined, and confirmed the view that the prisoner was sane. The same line of evidence was continued on the 24th, by Dr. Jamin Strong, of Cleveland, Ohio; Dr. Abram M. Shaw, of Middletown, Connecticut; and Dr. Orpheus Evarts, of College Hill, Ohio. An adjournment was taken to December 27th, and on that day Dr. A. E. Macdonald, of New York, was examined. His opinion was that the prisoner was sane, and had been playing a part in support of the theory of insanity.

The prisoner had for some days indulged in constant interruptions, not only contradicting witnesses and criticising counsel, but denouncing both with opprobrious epithets. On the 28th of December, during the further examination of experts, Drs. Randolph Barksdale, of

Richmond, Virginia, and John H. Callender, of Nashville, Tennessee, having followed Dr. Macdonald, a motion was made by Mr. Porter that the prisoner be removed from the counsel-table, where he had thus far sat, and placed in the dock. After this had been argued with considerable warmth on both sides, the judge decided to remand the prisoner to the dock. It was hardly necessary to say, he remarked, that the conduct of the prisoner had been in persistent violation of order and decorum. In the beginning, the only methods which could be resorted to to suppress this disorder were such as must infringe the constitutional rights of the prisoner, and that was conclusive argument against them. Until Saturday the 25th no other method had been proposed. Then this proposition (which he had already had in mind) was submitted. It had hitherto been an impression shared by the court and counsel, that the prisoner's conduct and language in court would afford the best indication of his mental and moral character, and contribute largely to the enlightenment of court and jury on the question of his responsibility. It was therefore on the express desire of the District Attorney that the court had allowed such latitude of conduct, in order to furnish the experts an opportunity of diagnosing the prisoner's case. As it now appeared, the opinions of the experts had been largely founded on the exhibitions which had taken place on the trial, and, if they had contributed to enable those experts to reach their conclusions, it would be a complete vindication of the view of the District Attorney as to the proper course to be pursued. At this stage of the trial, however, this object seemed to have been accomplished. The trial was now approaching its close. The experts had had ample opportunity to make up their judgments and pronounce them before court and jury. It was incumbent on the court now to impose such restraint as the circumstances of the case admitted, and which would conduce to the orderly conduct of the case. The prisoner had a right to hear the testimony of witnesses. He could not be gagged or sent out of court. The proper place for a prisoner on trial for felony was the dock. He could only come within the bar to be arraigned and to receive sentence. If the court granted him the privilege of sitting beside his counsel, it was a privilege which could be withdrawn summarily. While the prisoner had the undoubted right to act as his own counsel or to appear by counsel, he could not exercise both rights simultaneously. Having accepted counsel, the prisoner had waived his right to appear as such in person. On the consideration of all the circumstances the court thought that the motion would have to be granted, and that the prisoner should be placed in the dock, but he did not mean that the prisoner should be exposed to any danger. He should have the fullest protection.

The change, however, did not put a stop to the interruptions of the prisoner. Dr. Walter

Kempster, of Winnebago, Wisconsin, was examined December 29th and 30th, and the last expert witness for the prosecution, Dr. John P. Gray, of Utica, New York, on the 30th and 31st. With regard to Dr. Gray's testimony, it was publicly stated that he was called to Washington by the Government to make a thorough examination of the prisoner's condition, with a view to ascertaining whether there was real ground for the plea of insanity. If such should be the case, the Government preferred to have it substantiated, regarding it better as a matter of policy to have the accused shown to be a lunatic, and sent to an asylum, than to have him convicted. Dr. Gray made a thorough examination of the man in jail, and attended the trial from the opening day, and, against his inclination, and the preference of the prosecuting authorities, was forced to the conclusion that he was entirely sane. His testimony related to his study of the case, the various phases of insanity, and the grounds of the conclusion at which he had arrived. His evidence, which was finished on the 3d of January, concluded the testimony for the prosecution. The defense introduced some unimportant evidence in surrebuttal, that of the sculptor in regard to the cast of the prisoner's head being, however, excluded by the court, and applied for the privilege of bringing in new evidence. After argument, this was denied by Judge Cox. He said:

That if any new fact were developed now that struck his mind as having an important bearing on the defense or as necessary to a fair presentation of the case, he would deem it his duty (notwithstanding that the testimony for the defense was formally closed) to allow that fact to be given in evidence. Part of the testimony now proposed to be introduced was offered in the character of surrebutting testimony and part not. The first was the opinion of a medical expert as to the condition of the prisoner's mind. He understood the law and practice to be simply this: The law presumed sanity, and the first affirmative testimony on that issue had to come from the defense. Expert testimony was a part of the evidence in chief for the defense on that issue, and all the expert testimony on which the defense relied must be offered in chief. Part of it could not be reserved to be offered by way of surrebutting testimony. After that testimony was in, it then became the duty and the right of the prosecution to offer evidence on the general question of insanity. The prosecution was not confined to the mere contradiction of witnesses for the defense, but it might go at length into the question and offer independent and affirmative proof on that question. A part of that testimony was that of medical experts. That testimony was not offered strictly in contradiction of the medical testimony for the defense, because one man's opinion was not a contradiction of another man's opinion, but it was offered as independent testimony. When this testimony was closed on the part of the Government, then the defense was restricted to a contradiction of facts that may have been testified to on the part of the prosecution. It was not allowed to contradict an expert on the part of the prosecution by the testimony of another expert who had a different opinion. If that was allowed, there would be no end to the trial. It would run on to rejoinder and surrejoinder, and to all the innumerable issues which the ingenuity of counsel might devise; so that the privilege of producing expert testimony was limited to the evidence in chief for the defense, and to the evidence

in chief for the prosecution. He therefore thought that the testimony of Dr. McFarland could not be received on the question of the prisoner's sanity.

The offer was also made to prove that immediately after the assassination the prisoner claimed to have acted under inspiration. When the prisoner was on the stand as a witness he testified that he had committed this act under what he called, indifferently, inspiration or pressure. To rebut that testimony the prosecution had put on the stand Mr. Reynolds, who testified that he had an interview with the prisoner two weeks after the assassination, and that in that interview the prisoner did not claim to have acted under inspiration, but assigned, exclusively, political motives. It was not the object of the Government to prove that he did not claim inspiration, but simply to ask the jury to infer that the prisoner never did claim this inspiration until several weeks after the assassination, and after he had discovered that these men, whom he supposed he was benefiting by his deed, had repudiated it and were denouncing him. The hypothetical case, put by the prosecution to the experts, assumed that no claim of having acted under inspiration was made by the prisoner until two weeks afterward and up to the time of this interview of Mr. Reynolds with him. It would be an answer to that to show that on the very day of the assassination the prisoner did claim inspiration. As surrebutting testimony that evidence ought to be received. It struck him as strictly surrebutting testimony. As to the other testimony offered, which was not in reply to anything on the part of the Government, the common-law practice was that the Government should summon all the witnesses whose names were indorsed on the indictment, and it was really incumbent on the Government, as a matter of fairness, to summon all the witnesses who had been present at the transaction and had seen it. The Government was not bound, however, to examine all the witnesses so summoned; but as soon as the case for the Government was closed those witnesses were at the disposal of the defense. The proper time for the defense to call upon them was when the rebutting testimony was in course of presentation. In this case the defense had occupied two weeks in the presentation of its rebutting testimony, and it was at that time that, strictly speaking, this evidence should have been offered, if offered at all.

The next question was, what consideration should influence the court in allowing additional evidence which might have been produced if known at the proper time. Such evidence ought not to be admitted if it was purely cumulative. For example, the mental condition of Luther W. Guiteau had been so thoroughly canvassed on both sides that anything more in addition to that seemed purely and exclusively cumulative. Besides, it was not a direct fact in issue, but a somewhat collateral issue. The proof of Luther W. Guiteau's insanity did not prove that of the prisoner. It did nothing more than merely tend to corroborate the direct testimony on that point. He did not think that it ought to be admitted. As to the proposition to offer witnesses who had seen the prisoner in a public park a few days before the assassination, and had gathered from his conduct the impression that he was out of his mind, such testimony was of a very vague and uncertain character, and he did not think it sufficiently definite to warrant him in opening the case again. The only thing that he felt any uncertainty about was in reference to the testimony of detective McElfresh, who conducted the prisoner to the jail immediately after the occurrence. He would like more definite information as to what McElfresh could prove.

The prisoner: I had a talk with McElfresh going in a carriage to the jail. He wanted to know why I did it. I said it was on account of the political situation. I said, "Are you a stalwart?" and he said "Yes." He said, "There are a great many people who feel just like you in regard to the Republican party." The point was, it was the political situation

which drove me on the President. The prosecution wanted to show that it was because I was a disappointed office-seeker. I was not a disappointed office-seeker, and I would not have taken the Paris consulship after the 1st of June. Under the circumstances, therefore, I have a right to show that, on the day of the shooting, I told McElfresh that the cause was the political situation, and that without the political situation the President would not have been removed—and he would not have been removed any way, if the Lord had not crowded me into it.

Judge Cox (getting a chance to finish his ruling) said that if he had an affidavit as to what McElfresh would testify to he might be able to decide more satisfactorily, but that at present it seemed to him too vague. He thought, however, that the testimony as to the claim of inspiration, made on the day of the assassination or on the day after, was admissible as rebutting testimony.

The evidence was completed on the 4th of January, and the prosecution, through Mr. Davidge, presented the following requests to the court for rulings on the law points involved:

1. The legal test of responsibility where insanity is set up as a defense for the alleged crime is whether the accused, at the time of committing the act alleged, knew the difference between right and wrong in respect of such act. Hence, in the present case, if the accused, at the time of committing the act charged, knew the difference between right and wrong in respect of such act—that is, if he knew what he was doing, and that what he was doing was contrary to the law of the land—he is responsible.

2. If the accused knew what he was doing, and that what he was doing was contrary to the law of the land, it constitutes no defense, even if it were true, that when he committed the act he really believed that he was thereby producing a public benefit, or carrying out an inspiration of divine origin or approval. Such belief would not afford any excuse, nor would such excuse be afforded by the fact that, in the commission of the act, he was impelled by a depraved moral sense, whether innate or acquired, or by evil passion or indifference to moral obligation.

3. Insanity would, however, constitute a defense if, by reason of disease, the accused, at the time of committing the act charged, did not know what he was doing, or, if he did know it, that what he was doing was contrary to law.

4. The only evidence in the present case tending to show an irresistible impulse to commit the homicide is the claim of the accused that his free agency was destroyed by his alleged conviction that the death of the President was required for the good of the American people, and was divinely inspired; but such conviction, even if it really existed, could not afford any excuse, when the party knew what he was doing, and that it was contrary to law. No mere delusion or error of judgment, not even a fixed belief that what is prohibited by the law is commanded or approved by divine authority, can exempt the accused from responsibility for breaking the law. To have such effect, the commission of the act charged must have been the result of an insane delusion, which was the product of disease, and of such force as to deprive the accused of the degree of reason necessary to distinguish between right and wrong in respect of the act, so that at the time of committing the act he either did not know what he was doing, or if he did, that the act was wrong or contrary to the law of the land.

The court adjourned until the 7th, to allow the defense time to prepare their requests, which were as follows:

1. The legal test of responsibility, when insanity is set up as a defense for alleged crime, is not merely whether the accused knew at the time what he was doing, and that the act was contrary to law, for an ir-

responsible insane person may know those things, but was the act done as the result of an insane delusion, or was it committed under an influence or power which the accused could not resist by reason of his unsoundness of mind?

2. Although the accused may have known what he was doing, and that what he was doing was contrary to the law of the land, yet if, when he performed the act, he really believed that he was thereby producing a public benefit, and was actuated by an insane delusion that he was carrying out an inspiration of divine origin or approval, and would not have done the act but for such insane delusion, then the accused is not guilty of the crime charged against him, and the jury should find him "not guilty, by reason of insanity."

3. Insanity constitutes a defense if, by reason of it, the accused, at the time of committing the act charged, did not know what he was doing; or, if he did not know that what he was doing was contrary to law; or, if the act would not have been done by him but for reason of the insanity.

4. The only evidence in the present case tending to show an irresistible impulse to commit the homicide, or that the accused acted under the pressure of an insane delusion in doing the act, is found in the conduct and words of the accused as detailed in evidence. The question whether the free agency of the accused was destroyed by a conviction on his part that the death of the President was required for the good of the American people, and that he was divinely inspired to remove him by death, is one of fact to be determined by the jury from all the evidence in the case, and such evidence includes the acts as well as the words of the accused. But such conviction, if it really existed, could not afford any excuse when the party knew what he was doing, and that it was contrary to law, unless it was the product of an insane delusion, and he was impelled to do the act by such delusion. Such delusion may exist as to a divine requirement, or as to an inspiration from God. No mere delusion, unless it be the product of an unsound mind, nor error of judgment, nor even the fixed belief that what is prohibited by the law is commanded or approved by divine authority, can exempt the accused from responsibility for breaking the law, if at the time he knew what he was doing and that it was contrary to law, and he was not acting under an insane delusion. To have such effect, the committing of the act charged must have been the result of an insane delusion of such force as to deprive the accused of the degree of reason necessary to distinguish between right and wrong in respect of the act, as sane people generally judge of such conduct. The delusion must have been such that at the time of committing the act he either did not know what he was doing, or, if he did, he must have acted under a controlling conviction that the act was right. Although he may have known that the act was contrary to the law of the land, yet if he did it under the insane delusion that it was commanded to be done by God, such knowledge on his part would not make him liable to punishment.

5. Whether insanity exists or has existed at any time with the prisoner, and the degree of insanity, if any existed or has existed, are questions of fact to be determined entirely by the jury from the evidence.

6. If the jury find from the evidence that the prisoner was of unsound mind at the time of the doing of the act charged against him as criminal in this case, then it is also the duty of the jury to find whether said act was the result of such unsoundness of mind of the prisoner.

7. The punishments of the law are intended for rational persons, and no one but a rational person can commit the crime of murder.

8. Insanity may be interposed as a legal defense in any prosecution for an otherwise criminal act, and, if such defense be established by the evidence, it takes away the criminality, and the act ceases to be a crime in contemplation of law.

9. If the jury have a reasonable doubt as to the san-

ity of the accused at the time of committing the act charged against him as a crime, they should give him the benefit of that doubt, and should find him "not guilty, by reason of insanity."

10. The jury are the sole judges of the credibility of witnesses, and have a right to take into account, in weighing the evidence, any apparent feeling or interest manifested by witnesses on the stand, their manner of testifying, their compensation or want of compensation, and any other circumstances connected with their testimony which the jury may think would influence them.

11. If the jury believe, from the evidence, that the prosecution have willfully suppressed evidence of the mental condition of the accused during two weeks next following the shooting of President Garfield, which it was in their power to have produced on the trial, the jury have a right to take that fact into consideration, as raising a presumption that such evidence, if produced, would have been unfavorable for the prosecution.

12. If the jury shall believe, from the evidence, that the prisoner was of sound mind, or not so insane as to be irresponsible for the act, at the time of shooting at the President, on the 2d day of July, 1881, and that he then unlawfully and willfully, but without malice in fact, in the District of Columbia, shot at and thereby injured the President, of which shooting and injury the person so injured subsequently died in the State of New Jersey, and within the United States, then the prisoner is guilty of the crime of manslaughter, and the jury should so find.

13. The jury are instructed to find a separate verdict upon each count in the indictment, and, inasmuch as it is charged in the first, second, fourth, fifth, seventh, and eighth counts of the indictment in this case, that the death of the President took place in the county of Washington, in the said District of Columbia, and there is no evidence of such fact, therefore the jury are directed to find the accused not guilty upon each of said counts, separately.

14. Inasmuch as the evidence is uncontradicted in this case that the wound was inflicted upon the President by the accused, on the 2d day of July, A. D. 1881, in the county of Washington, in the District of Columbia, and that the President subsequently, and in the month of September, A. D. 1881, died of such wound in the State of New Jersey, the jury are instructed that, by reason of these facts, the accused is not guilty of the crime of murder charged in the indictment, and the verdict must be "not guilty," unless the jury shall find him guilty of manslaughter, as charged in the twelfth prayer of the defense.

Arguments to the court on these points were made by Messrs. Davidge, Corkhill, and Porter for the prosecution, and Reed and Scoville for the defense, accompanied by some sharp criticisms on each side with reference to the conduct of counsel on the other. The District Attorney took occasion in his argument to examine the question of jurisdiction. On the 10th of January, after the close of the arguments, Judge Cox proceeded to state his views on the prayers submitted on both sides—first giving his attention to the question of jurisdiction. He said that at an early stage in the case he had expressed a preference to hear that question discussed in a preliminary form by way of demurrer, or motion, or plea, because a determination of it adversely to the jurisdiction would have spared all the labor and trouble of the trial. Counsel, however, had the privilege of making the question at any stage of the case. The jurisdiction of the court had been publicly discussed and seriously

challenged, and he had felt it incumbent on him not to ignore a question so vital to the rights of the accused. He had deemed it his duty, therefore, to investigate the question thoroughly. After a very exhaustive review of the English and American authorities, he expressed his conviction that the English authority was decidedly in favor of jurisdiction where the blow had taken place, and that in this country there was a strong array of authority in the same direction. He felt at liberty to adopt and announce the doctrine (which conformed to common sense), that the jurisdiction was complete where the fatal wound had been inflicted, and that, therefore, the place of death was immaterial. Consequently, it would be improper to grant the thirteenth instruction prayed for by the defense, because the offense charged might be tried and conviction might follow under those counts of the indictment which averred the death to have occurred in the District of Columbia. For the same reason the fourteenth instruction relating to jurisdiction had to be denied. When it became his duty to charge the jury in the case, it would be his effort to expand and illustrate so much of those instructions as he considered correct; but, for the present, he merely desired to express his opinion sufficiently to guide the counsel in their arguments to the jury. He then proceeded to consider the first and second prayers of the prosecution in connection with the third, fifth, sixth, and eighth prayers of the defense.

The first instruction asked for by the prosecution—namely, that “the legal test of responsibility where insanity is set up as defense for alleged crime, is whether the accused at the time of committing the act charged knew the difference between right and wrong in respect of such act”—he regarded as correct. He reviewed at great length the questions involved in the McNaughton case, and quoted from testimony given by Lord Justice Fitz James Stephen before a parliamentary committee which had before it, in 1874, a bill to define the law of insanity. He referred to this, he said, simply to show that the answers of the judges in the McNaughton case had not since been regarded as clearly establishing the proposition that a mere capacity to know the law of the land subjected persons to criminal responsibility. Since the McNaughton case a number of homicide cases had been tried at *nisi prius* in England, and he had not been able to find one in which a knowledge of the law of the land had been laid down as a test. In the United States there were numerous cases that applied to a knowledge of right and wrong in regard to the particular case, but the instructions had been in the most vague and general terms. He would therefore state his own views, which he did as follows:

To a sane man an act, whether morally wrong or not, is wrong if it is in violation of the law of the land. It can not be right for him, although he may think

that independently of the law it would be. It can not be right for him, although he may think it is right notwithstanding the law, and that he may rightfully commit it in violation of the law. But, while a sane man is responsible for opinions contrary to law if carried out in practice, an insane man is not held to the same responsibility. He may know the law of the land, but in his delusions he may insanely believe that it is not the law for him, but that he is acting under a higher authority which supersedes it. If, therefore, I am to rule upon this proposition as presented, I grant it only with a qualification, and I give as a substitute therefor my own (marked No. 1), as follows:

No. 1. The legal test of responsibility where insanity is set up as a defense for alleged crime is whether the accused at the time of committing the act charged knew the difference between right and wrong in respect of such act. Hence, in the present case, if the jury find that the accused committed the act charged in the indictment, and at the time of the commission of his crime knew what he was doing, and that what he was doing was contrary to the law of the land, he is responsible; unless, in consequence of insane mental delusions or other form of mental disorder, he was laboring under such defect of reason as to be incapable of understanding the obligation of the law of the land and the duty and necessity of obedience to it, and of understanding that his act was wrong because it was in violation of the law.

I have prepared instruction No. 2, which embodies all that I think is correct in the remaining instructions asked for by the Government, and in the first four instructions asked for by the defense. It is as follows:

No. 2. If the jury find that the defendant committed the act charged, and at the time thereof knew what he was doing, and that what he was doing was contrary to the law of the land, it constitutes no excuse, even if it is true, that when he committed the act he really believed that he was producing a great public benefit, and that the death of the President was required for the good of the American people; nor would such excuse be afforded by the fact that in the commission of the act he was controlled by a depraved moral sense, whether innate or acquired, or by evil passions or indifference to moral obligations. And even if the jury find that the defendant, as a result of his own reasoning and reflection, arrived at the determination to kill the President, and as a further result of his own reasoning and reflection believed that his said purpose was approved, or suggested, or inspired by the Deity, such belief would afford no excuse. But it would be different, and he would not be responsible criminally, if the act was done under the influence and as the product of an insane mental delusion that the Deity had commanded him to do the act, which had taken possession of his mind not as a result of his own reflections, but independently of his own will and reason, and with such force as to deprive him of the degree of reason necessary to distinguish between right and wrong as to the particular act. In such case, even if he knew that the act was a violation of the law of the land, he would not be responsible if his reason was so perverted by the insanity that he was incapable of understanding the obligation of the law of the land, and that the act was wrong under the obligation of that law and wrong in itself.

Judge Cox continued as follows:

In this connection I add the words “wrong in itself,” because I can conceive a case in which one might believe, insanely, that the law of the land provided no punishment for murder, and yet the person might be perfectly aware of the moral enormity of the crime. I would be unwilling to pronounce such a person irresponsible.

I have omitted from this instruction one important feature of that asked for on the part of the defense.

It is expressed in the first sentence of the first prayer, in these words: "Or was it committed under an influence or power which the accused could not resist by reason of his unsoundness of mind?" It can not be denied that some of the most respectable courts in this country have recognized it as possible that a man may be driven against his own will to the commission of an act which he knows to be wrong by an insane, irrepressible impulse within him, overriding his own will and conscience; and those courts maintain that, as under such circumstances the will to do wrong (which is the very essence of criminality) is wanting, he ought not to be held criminally responsible. They, therefore, hold that the test of the knowledge of right or wrong ought to be qualified by the further condition whether the person had the power to choose between doing or not doing the act. The question is a dangerous one alike for courts and juries to handle, and I do not intend to express an opinion upon it, further than the facts of the case require. Those facts seem to relieve me from the necessity and the responsibility of discussing it generally. If we struck out of this case all the declarations and testimony of the defendant himself, we have no light whatever on this subject. There are circumstances, such as his actions and conduct, which, his counsel may argue, of themselves indicated some aberration, and are corroborative of and explained by his testimony. But of themselves they would have afforded no indication of the particular motive or special form of delusion that actuated him. Of this we have no indications except in the declarations, oral or written, of the defendant himself. But he has never claimed that he was irresistibly impelled to do an act which he knew to be wrong. On the contrary, he always claimed that it was right. He justified it at the time, and afterward, in his papers, as a political necessity and an act of patriotism, and whether he claimed inspiration early or late, he has claimed that the act was inspired, and therefore right. He has used the words "pressure" and "inspiration" interchangeably, as it were, to express the idea. This has no meaning unless it be that he was under an insane delusion that the Deity had inspired and commanded the act. He has certainly not separated the idea of pressure and impulse from the conviction of inspiration and right and duty.

The defendant has asserted no form of insanity which does not involve the conviction that the act was right, and I feel sure that I am not transcending the privilege of the court when I say that there is no evidence in the case outside of his own declaration tending to prove irresistible impulse as a thing by itself and separate from this alleged delusion. Therefore, the case does not seem to me to present or call for any ruling on the hypothesis of an irresistible impulse to do what the accused knew to be wrong and what was against his will. Whether there is such a thing as irresistible insane impulse to commit crime, and whether it has existed in any particular case, are questions of fact and not of law. In this case, I think, there is no testimony showing that it can exist by itself as an independent form of insanity, but rather the contrary. There is, however, testimony tending to show that such impulses result from and are associated with insane delusions, and especially with an insane delusion as that the party has received a command from the Deity to do an act. But if such an insane delusion exists, so as to destroy the perceptions of right and wrong as to the act (which is substantially the defendant's claim), this of itself is irresponsible insanity, and there is no need to consider the subject of impulses resulting from the delusion. On the other hand, if there were no insanity, but a mere fanatical opinion or belief, the only impulse that could have actuated the defendant must have been a sane one—such a one as, in the most favorable view of it, a mistaken sense of duty—which impulse the law requires him to resist and control.

In connection with the medical testimony tending

to show that these impulses are always or generally associated with some insane delusion, if there are facts tending directly to show the existence or absence of an irresistible impulse, they may perhaps furnish some evidence of the existence or absence of insane delusion. But I think, in view of the undisputed features of this case, it would only confuse and perhaps mislead the jury to give them any instruction directly upon the subject of irresistible impulse, and that this particular case does not call for any qualification for the general rule adopted, as I have mentioned, as the test of responsibility.

The twelfth instruction is drawn with reference to section 5342 of the Revised Statutes. I do not understand that statute to create any new species of manslaughter. It uses the common-law definitions of both murder and manslaughter, and (perhaps in view of the doubts I have already spoken of) applies them to two cases where the mortal wound was inflicted in one jurisdiction and the death occurred in another. The terms "malice" and "maliciously," used in the statute, would have no meaning except by reference to the common law. We know that the term "malice," in the definition of murder, does not require that proof shall be given of any special hatred or ill-will to the deceased, but that the deliberate intent to kill, from whatever motive, constitutes all the malice that the law requires to be shown, and that the term "without malice" in the definition of manslaughter means simply without premeditated intent, as where the killing occurs in the heat of passion or sudden quarrel. All this I will explain to the jury when it becomes necessary to charge them. But the instruction—in its use of the phrase "without malice in fact"—might convey the idea to the jury that if the killing was done from the motives declared by the prisoner, and if he had, as he says, no personal ill-will toward the President, it was not murder. It is objectionable on this ground, and every object that could be properly sought under this head will be attained by the explanations which I have indicated to be made to the jury. It becomes important, in the first place, to settle the rules of evidence by which the jury is to be guided in weighing the proofs.

In reference to the question on whom rests the burden of proof where insanity is relied on as a defense, three different and conflicting views have been held by three different courts. According to one view it is incumbent on the accused to establish the fact of his insanity at the time of commission of the alleged crime by evidence so conclusive as to exclude all reasonable doubt of it. But this view derives so little support from authority that it may be passed over without comment as inadmissible. Another view is that the defense of insanity is an affirmative one, which the party asserting it must establish to the satisfaction of the jury by at least a preponderance of evidence. That is to say, the evidence in favor of it need not be so conclusive as to leave no room for reasonable doubt, but it must have more weight with the jury than the evidence against, so that they would feel justified in finding the fact as they would find any fact in a civil suit, in which all questions of fact are decided according to the weight of the evidence. Still another view is that the sanity of the accused is just as much a part of the case of the prosecution as the homicide itself, and just as much an element in the crime of murder, the only difference being that as the law presumes every one to be sane, it is not necessary for the Government to produce affirmative evidence of the sanity, but that if the jury have a reasonable doubt of the sanity they are just as much bound to acquit as if they entertained a reasonable doubt of the commission of the homicide by the accused. After a careful examination of the authorities, some of which are mere dicta, and others not well considered or even consistent statements of opinions, I am satisfied that the best reasons and most weighty of them sustain the views which I now proceed to state. I have examined all the authorities with great care over and over again.

The cases that are referred to in support of the second rule are somewhat more numerous than the others. Some of them, however, turn on the statutory definitions of the charge of murder. A great many of the cases are mere dicta, and some of them involve utter contradictions. Not one of them contains the least show of argument. With us there is no statutory definition of murder. We have the common-law definition of murder as occurring when a homicide is committed by a person of sound memory, discretion, etc. The opinions which support the last view are decidedly entitled to most confidence. They are reasoned out from first principles, and their reasonings have been unanswered, and are, in my judgment, unanswerable. In the case of Stone, tried in this court a few years ago, the instructions were as follows: "In a capital case the defense of insanity is required to be made out by most clear and convincing proof. In this case the jury must judge of the evidence offered to sustain the defense; and if, on consideration of all the evidence in connection with the assumption that what a man does is sanely done, the jury entertains a reasonable doubt as to whether the prisoner committed the homicide charged, or as to whether at the time of the commission he was in a sane state of mind, they must acquit him."

I shall, however, adopt the suggestion which is found in some of the later authorities—that is, not to instruct the jury to acquit if they feel a reasonable doubt about any one fact in the issue; but I shall instruct them as to the nature of the crime and as to all the elements composing it, including that of responsibility. I shall instruct them as to the presumption of innocence and sanity, and shall tell them finally that, on the whole evidence and on the consideration of both these presumptions, if they have a reasonable doubt of the guilt of the prisoner, the prisoner is entitled to an acquittal.

The tenth and eleventh instructions asked for on the part of the defense do not involve any serious question. The eleventh instruction asks me to say that, "if the jury believe from the evidence that the prosecution has willfully suppressed evidence of the mental condition of the prisoner during two weeks following the shooting of President Garfield which it was in their power to have produced in the trial, the jury have a right to take that fact into consideration as a presumption that such evidence, if it had been produced, would have been unfavorable to the prosecution."

Any instruction ought to be based on some evidence in the case, and if I were to grant the instruction in that form I would be assuming that there was some evidence in the case tending to show a willful suppression of evidence by the prosecution. I can not so assume. It is always, however, open to either side to argue that evidence which might have been produced and which has not been produced should be regarded as injurious to the party refusing to produce it. But I do not think the court ought to give a formal instruction in the shape of either the tenth or eleventh prayer. I have already given my views on the twelfth and remaining prayers.

At the conclusion of Judge Cox's decision the prisoner remarked, "I am satisfied with the law as laid down by your Honor."

The arguments before the jury were begun on the 12th of January. Mr. Davidge spent two days in summing up the evidence for the prosecution and discussing its bearing on the plea of insanity. He endeavored to show that the deed of the accused was deliberately planned and systematically carried out, having for its motives desire for revenge, love of notoriety, and hope of escape from consequences through miscalculated political influence. His career was treated as showing depravity and wickedness, unbridled

passion, inordinate vanity, and unregulated ambition, and not insanity. Mr. Davidge was followed by Mr. Reed, who occupied one session of the court in summing up the evidence for the defense. He took the ground that the accused had been shown to be a mental wreck and an irresponsible lunatic, whose conviction and punishment for crime would be a disgrace to American jurisprudence.

On the first day of the arguments before the jury the question was raised of allowing the prisoner to close the case in his own behalf, as he desired to do. His counsel seconded his wish, but the District Attorney objected. The matter was not settled at the time, but, after the delivery of Mr. Reed's address, the proposed speech of the prisoner was given to the press and published on the 16th of January. It was made up of a reiteration of his claims to patriotism, piety, and divine inspiration, and contained nothing new of a noteworthy character. He claimed, as he had repeatedly done in the course of the proceedings, that he had the sympathy of a large and increasing class of good citizens, that public opinion was growing in his favor, and that posterity would justify his deed, and condemn any action against him.

Mr. Scoville occupied nearly five days in addressing the jury, beginning on the 16th and concluding on the 20th. He went over the ground covered by the evidence, examined the law regarding legal responsibility, contended that the prisoner had long been an insane man, denounced the spirit and method of the prosecution, and attacked prominent politicians who were, he claimed, responsible for the state of affairs which wrought upon the disordered faculties of the accused and impelled him to the deed of July 2d. He closed with an appeal to the jury to save the country from the disgrace of executing an insane man in obedience to popular clamor, after an unfair trial, and for the purpose of screening from detestation men who were responsible for his deed.

At the close of Mr. Scoville's address, the District Attorney withdrew all objection to the prisoner speaking to the jury, as he did not "intend that any error should get into the record upon which there was any possibility that a new trial should be allowed." This explanation called forth an acrimonious protest from the defense, and Judge Cox granted the prisoner's request to address the jury, remarking that some of his brethren of the bench "had very serious doubts whether, in a capital case, the prisoner could be denied the right to address the jury." Accordingly, on the 21st of January, Guiteau read the speech which had already been published, with a brief preface referring to a decision that had just been made by the New York Court of Appeals, to the effect that the proof of insanity, beyond a reasonable doubt, rested with the prosecution.

On Monday, the 23d of January, Mr. Porter began the closing address in behalf of the Government, and occupied the greater part of

three days. It was devoted largely to portraying and denouncing with scathing invective the character of the accused as revealed by the evidence, and demolishing the defense of insanity. It described the prisoner as a monster of iniquity, animated by selfish motives and vengeful feelings, presuming at first on the protection of a political faction to be benefited by his deed, whose moral standard he assumed to be as low as his own, and resorting when this dependence failed to a pretense of divine inspiration and irresistible pressure. The address was frequently interrupted by the most bitter and violent interjections from the prisoner, and occasionally by heated objections from the counsel for the defense, who claimed that the speaker went beyond the evidence. The only check which the court found occasion to administer was to prevent a reference to expressions of public opinion, intended to counteract the prisoner's often reiterated assertion that the American people sympathized with him, and demanded his acquittal.

Immediately upon the close of Mr. Porter's address, at 3.15 P. M., on January 25, 1882, Judge Cox delivered his charge to the jury. After speaking of the rights which were guaranteed to accused persons, he proceeded:

Every accused person, he said, was presumed to be innocent until the accusation was proved. With what difficulty and trouble the law had been administered in the present case, the jurors had been daily witnesses. It was, however, a consolation to think that not one of those sacred guarantees of the Constitution had been violated in the person of the accused. At last the long chapter of proof was ended, the task of the advocate was done, and it now rested with the jury to determine the issue between public justice and the prisoner at the bar. No one could feel more keenly than himself the great responsibility of his duties, and he felt that he could only discharge them by close adherence to the law, as laid down by its highest authorities. Before proceeding further, he wished to notice an incident which had taken place pending the recent argument. The prisoner had frequently taken occasion to proclaim that public opinion, as evidenced by the press and correspondence, was in his favor. Those declarations could not have been prevented, except by the process of gagging the prisoner. Any suggestion that the jury could be influenced by such lawless clattering of the prisoner would have seemed to him absurd, and he should have felt that he was insulting the intelligence of the jury, if he had warned them not to regard it. Counsel for the prosecution had felt it necessary, however, in the final argument, to interpose a contradiction to such statements, and an exception had been taken on the part of the accused to the form in which that effort was made. For the sole purpose of purging the record of any objectionable matter, he should simply say that anything which had been said on either side in reference to public excitement or to newspaper opinion was not to be regarded by the jury.

The indictment charged the defendant with having murdered James A. Garfield, and it was the duty of the court to explain the nature of the crime charged. Murder was committed where a person of sound memory and discretion unlawfully killed a reasonable being in the peace of the United States with malice aforethought. It had to be proved, first, that the death was caused by the act of the accused, and, further, that it was caused with malice aforethought. That did not mean, however, that the Government had to

prove any ill-will or hatred on the part of the accused toward the deceased. Wherever a homicide was shown to have been committed without lawful authority and with deliberate intent, it was sufficiently proved to have been done with malice aforethought, and malice was not disproved by showing that the accused had no personal ill-will to the deceased, and that he killed him from other motives—as, for instance, robbery, or through mistaking him for another, or (as claimed in this case) to produce a public benefit. If it could be shown that the killing occurred in a heat of passion or under provocation, then it would appear that there was no premeditated attempt, and therefore no malice aforethought, and that would reduce the crime to manslaughter. It was hardly necessary, however, to say that there was nothing of that kind in the present case. The jury would have to say either that the defendant was guilty of murder or that he was innocent. In order to constitute the crime of murder, the assassin must have a reasonably sane mind—in technical terms, he must be “of sound mind, memory, and discretion.” An irresponsibly insane man could not commit murder. If he was laboring under a disease of the mental faculties to such an extent that he did not know what he was doing, or did not know it was wrong, then he was wanting in that sound mind, memory, and discretion that was a part of the definition of murder. In the next place, every defendant was presumed innocent until the accusation against him was established by proof. In the next place, notwithstanding this presumption of innocence, it was equally true that a defendant was presumed to be sane, and to have been so at the time the crime was committed—that is to say, that the Government was not bound to show affirmatively, as a part of its proofs, that the defendant was sane. As insanity was the exception, and as the majority of men are sane, the law presumed the latter condition of every man, until some reason was shown to believe to the contrary. The burden was, therefore, on the defendant, who set up insanity as an excuse for crime, to produce proofs in the first instance to show that that presumption was mistaken, so far as it related to the prisoner. Crime, therefore, involved three elements—the killing, malice, and a responsible mind in the murderer. After all the evidence was before the jury, if the jury, while bearing in mind both those presumptions—that is, that the defendant is innocent till he is proved guilty, and that he is sane till the contrary appears—still entertained what is called a reasonable doubt on any ground, or as to any of the essential elements of the crime, then the defendant was entitled to the benefit of that doubt and to an acquittal.

It was important to explain to the jury here in the best way that the court could what is a reasonable doubt. He could hardly venture to give an exact definition of the term, for he did not know of any successful attempt to do so. As to questions relating to human affairs, a knowledge of which is derived from testimony, it was impossible to have the same kind of certainty that is created by scientific demonstration. The only certainty that the jury could have was a moral certainty, depending on the confidence which the jury had in the integrity of witnesses, and in their capacity and opportunity to know the truth. If, for example, facts not improbable in themselves were attested by numerous witnesses, credible and uncontradicted, and who had every opportunity to know the truth, a reasonable or moral certainty would be inspired by that testimony. In such a case doubt would be unreasonable, or imaginary, or speculative. It ought not to be a doubt as to whether the party might not be innocent in the face of strong proofs of his guilt; but it must be a sincere doubt, whether he had been proved guilty. Even where the testimony was contradictory, and where so much more credit should be given to one side than the other, the same result might be produced. On the other hand, the opposing proofs might be so balanced that the jury

might justly doubt on which side, under all the circumstances, the truth lay, and in such case the accused party was entitled to the benefit of the doubt. All that a jury could be expected to do was to be reasonably and morally certain of the facts which they declared to be their verdict. In illustration of this point, Judge Cox quoted the charge of Chief-Justice Shaw, of Massachusetts, in the case of the Commonwealth against Webster.

With reference to the evidence in this case very little comment was required by the court, except upon one question—the others being hardly matters of dispute. That the defendant fired at, and shot, the deceased President was abundantly proved; that the wound was fatal had been testified to by the surgeons, who were competent to speak, and they were uncontested; that the homicide was committed with malice aforethought (if the defendant were capable of criminal intent or malice), could hardly be gainsaid. It was not necessary to prove that any special or express hatred or malice was entertained by the accused toward the deceased. It was sufficient to prove that the act was done by deliberate intent, as distinct from an act done under a certain impulse in the heat of blood and without previous malice. Evidence had been exhibited to the jury tending to show that the defendant admitted in his own handwriting that he had conceived the idea of “removing the President,” as he called it, six weeks before the shooting; that he had deliberated upon it and come to the determination to do it, and that about two weeks before he accomplished it he stationed himself at certain points to do the act, but for some reason was prevented. His preparation for it by the purchase of a pistol had been shown. All these facts came up to the full measure of the proof required to establish what the law denominated malice aforethought. The jury would find little difficulty in reaching a conclusion as to all the elements that made up the crime charged in the indictment, except it might be as to the one of sound mind, memory, and discretion—but that was only a technical expression for a responsible, sane man. He now approached that difficult question. He had already said that a man who is insane in the sense that makes him irresponsible can not commit a crime. The defense of insanity had been so abused as to be brought into great discredit. It was the last resort in cases of unquestioned guilt. It had been an excuse for juries to bring in a verdict of acquittal when there was a public sympathy for the accused, and especially where there was provocation for the homicide according to public sentiment, but not according to law. For that reason the defense of insanity was viewed with disfavor, and public sentiment was hostile to it. Nevertheless, if insanity were established to a degree necessary, it was a perfect defense for an indictment for murder, and must be allowed full weight. It would be observed that in this case there was no trouble with any question about what might be called total insanity, such as raving mania or absolute imbecility, in which all exercise of reason is wanting, and where there is no recognition of persons or things or their relations. But there was a debatable border-line between sanity and insanity, and there was often great difficulty in determining on which side of this line a person was to be put. There were cases in which a man's mental faculties generally seemed to be in full vigor, but where on one single subject he seemed to be deranged. A man was possessed, perhaps, by a belief of something absurd which he could not be reasoned out of (what was called an insane delusion), or he might have some morbid propensity, seemingly in harsh discord with the rest of his intellectual and moral nature. Those were cases which, for want of a better term, were called partial insanity. Sometimes its existence and sometimes its limits were doubtful and undefinable, and in those cases it was difficult to determine whether the patient had passed the line of moral or legal accountability for his actions.

The jury would bear in mind that a man did not become irresponsible by the mere fact of his being partially insane. Such a man did not take leave of his passions by becoming insane. He might retain as much control over them as in health. He might commit offenses, too, with which his infirmity had nothing to do. He might be sane as to the crime he committed, might understand its nature, and might be governed by the same motives in relation to it as other people, while on other subjects having no relations whatever to the crime he might be the victim of delusion. Whenever this partial insanity was relied on as a defense, it must appear that the crime charged was a product of the delusion or other morbid condition, and connected with it as effect with cause, and that it was not the result of sane reasoning which the party might be capable of, notwithstanding his limited and circumscribed disorder. Assuming that that infirmity of mind had a direct influence on crime, the difficulty was to fix the character of the disorder which fixed responsibility or irresponsibility in law. The outgoings of the judicial mind on that subject had not been always entirely satisfactory nor in harmony with the conclusions of medical science. Courts had, in former times, passed upon the law in regard to insanity without regard to the medical aspect of the subject; but it would be only properly dealt with by a concurrence of harmonious treatment between the two sciences of law and medicine. The courts had, therefore, adopted and again discarded one theory after another in the effort to find some common ground on which to stand, and his effort would be to give to the jury the results most commonly accepted by the courts. It would be well to say a word to the jury as to the kind of evidence by which courts and juries were guided in this difficult and delicate inquiry. That subtle essence called mind defied, of course, ocular inspection. It could only be known by its manifestations. The test was as to whether the conduct of the man and his thoughts and emotions conformed with those of persons of sound mind, or whether they contrasted harshly with it. By that a judgment was formed as to a man's soundness of mind. And for that reason evidence was admissible to show conduct and language that would indicate to the general mind some morbid condition of the intellectual powers. Everything relating to his mental and physical history was, therefore, relevant, because any conclusion on the subject must often rest on a large number of facts; and letters, spontaneously written, afforded one of the best indications of mental condition. Evidence of insanity in the parents was always pertinent; but juries were never allowed to infer insanity of the accused from the mere fact of its existence in the ancestors. When, however, there was evidence tending to show insane conduct on the part of the accused, evidence of insanity in the ancestors was admissible as corroborative of the others. Therefore it was that, in this case, the defense had been allowed to introduce evidence covering the whole life of the accused and reaching also his family antecedents. In a case so full of detail, he should deem it to be his duty to call the attention of the jury to particular parts of it, but he wished the jury distinctly to understand that it was their province, and not his, to decide upon the facts; and if he, at any time, seemed to express or intimate an opinion on the facts (which he did not design to do) it would not be binding on them; but they must draw their own conclusions from the evidence.

The instructions which he had already given to the jury imported that the true test of criminal responsibility, where the defense of insanity was interposed, was whether the accused had sufficient use of his reason to understand the nature of the act with which he was charged, and to understand that it was wrong for him to commit it. If those were the facts, he was criminally responsible for the act, whatever peculiarities might be shown of him in other respects. On the other hand, if his reason were so defective, in conse-

quence of brain-disease, that he could not understand what he was doing, or could not understand that what he was doing was wrong, he ought to be treated as an irresponsible lunatic. As the law assumed every one, at the outset, to be sane and responsible, the question was, What was there in this case to show the contrary as to this defendant? A jury was not warranted in inferring that a man was insane from the mere fact of his committing a crime, or from the enormity of the crime, because the law presumes that there is a bad motive, and that the crime is prompted by malice, if nothing else appears. Perhaps the easiest way for the jury to examine into the subject was, first to satisfy themselves about the condition of the prisoner's mind for a reasonable period of time before any conception of the assassination had entered it, and also at the present time, and then consider what evidence exists as to a different condition of mind at the time of the commission of the act. He should not spend any time on the first question, because to examine it at all would require a review of the evidence relating to over twenty years of the prisoner's life, and this had been so exhaustively discussed by counsel that anything he could say would be a wearisome repetition. It was enough to say that, on the one side, this evidence was supposed to show a chronic condition of insanity before the crime, and, on the other side, to show an exceptionally quick intelligence and decided powers of discrimination. The jury would have to draw its own conclusions. Was the prisoner's ordinary, permanent, chronic condition of mind such that he was unable to understand the nature of his actions, and to distinguish between right and wrong in his conduct? Was he subject, all the time, to insane delusions, which destroyed his power so to distinguish; and did those continue down to, and embrace, the act for which he is on trial? If so, he was simply an irresponsible lunatic. On the other hand, had he the ordinary intelligence of sane people, so that he could distinguish between right and wrong as to his actions? If another person had committed the assassination, would the prisoner have appreciated the wickedness of it? Would he have understood the character of the act and its wrongfulness if another person had suggested it to him? The jury must consider these questions in their own mind. If the jury were satisfied that his ordinary and chronic condition was that of sanity—at least so far that he knew the character of his own actions, and how far they were right or wrong—and that he was not under any permanent insane delusion which destroyed his power of discriminating between right and wrong, then the remaining inquiry was, whether there was any special insanity connected with this crime. It would be seen that the reliance of the defense was the existence of an insane delusion in the prisoner's mind which so perverted his reason as to incapacitate him from perceiving the difference between right and wrong as to this particular act.

As a part of the history of judicial sentiment on this subject, and by way of illustrating the difference between insane delusions and responsibility, he would refer the jury to a celebrated case in English history which had already been commented on in the arguments. Judge Cox here quoted from the opinions of the judges in the *McNaughton* case and from some American authorities on the same subject. He went on to say that the subject of insane delusion played an important part in this case and demanded careful consideration. The subject was treated to a limited extent in judicial decisions, but more was learned about it from works of medical jurisprudence and from expert testimony. Sane people were sometimes said to have delusions proceeding from temporary disorders and from mistakes in the senses. Sometimes they speculated on matters beyond the scope of human knowledge, but delusions in sane people were always susceptible of being corrected and removed by evidence and argument. On the contrary, insane delusions, according to all testimony, were unreasoning and incorrigible. Those who had them believed in

the existence of facts which were either impossible absolutely or impossible at least under the circumstances of the individual. A man might, with no reason for it, believe that another was plotting against his life, or that he himself was the owner of untold wealth, or that he had invented something which would revolutionize the world, or that he was the President of the United States, or Christ, or God, or that he was inspired by God to do a certain act, or that he had a glass limb, and those were cases of insane delusion. Generally, the delusion centered around the patient himself, his rights or his wrongs. It came and went independently of the exercise of will and reason, like the phantom of a dream. It was, in fact, the waking dream of the insane, in which ideas presented themselves to the mind as real facts. The most certain thing was, that an insane delusion was never the result of reasoning and reflection; was not generated by the mind, could not be dispelled by them. A man might reason himself, or be reasoned by others, into absurd opinions and be persuaded into impracticable schemes, but he could not be reasoned or persuaded into insanity or insane delusions. Whenever evidence was found of an insane delusion, it was found that the insane delusion did not relate to mere sentiment or theory, or abstract questions in laws, politics, or religion. All these were subjects of opinions, and were founded on reasoning and reflection. Such opinions were often absurd in the extreme. Some persons believed in animal magnetism, in spiritualism, and other like matters, in a degree which seemed absurd to other people. There was no absurdity in regard to religious, political, and social questions that had not its sincere supporters. Those opinions might arise from natural weakness, bad reasoning powers, ignorance of men and things, fraudulent imposture, and often from perverted moral sentiment; but still they were opinions founded on some kind of evidence, and liable to be abandoned on better information or on sounder reasoning, but they were not insane delusions. An insane delusion was the coining of a diseased brain, which defies reason and ridicule, and throws into disorder all the springs of human action.

Before asking the jury to apply these considerations to the facts in this case, he wished to premise one or two things. The question for the jury to determine was, What was the condition of the prisoner's mind at the time when this project was executed? If he were sufficiently sane then to be responsible, it mattered not what might have been his condition before or after. Still, evidence had been properly admitted as to his previous and subsequent condition, because it threw light, prospectively and retrospectively, on his condition at the time. Inasmuch as these disorders were of gradual growth and of indefinite continuance, if he were insane shortly before or shortly after the commission of the crime, it was natural to infer that he was so at the time. But still, all the evidence must center around the time when the deed was done. The jury had heard a good deal of evidence respecting the peculiarities of the prisoner through a long period of time before this occurrence, and it was claimed on the part of the defense that he was during all that time subject to delusions that were calculated to disturb his reason, and to throw it off its balance. The only materiality of that evidence was the probability which it might afford of the defendant's liability to such disorders of mind, and the corroboration which it might yield to other evidence tending to show such disorder at the time of the commission of the crime. The jury must determine whether at the time the homicide was committed the defendant was laboring under any insane delusion prompting or impelling him to do the deed. Naturally, they would look first to any explanation of the act that might have been made by the defendant himself at the time, or immediately before or after. Several papers had been laid before them that had been in the prisoner's possession, and that purported to assign the motive for the deed. In the address to the American people of the 16th of June he

said: "I conceived the idea of removing the President four weeks ago. Not a soul knew of my purpose. I conceived the idea myself, and I kept it to myself. I read the newspapers carefully, for and against the Administration, and gradually the conviction dawned upon me that the President's removal was a political necessity, because he proved a traitor to the men who made him, and thereby imperiled the life of the nation." Again he said in this address: "Ingratitude is the basest of crimes. The President, under the manipulation of the Secretary of State, has been guilty of the basest ingratitude to the Stalwarts. His express purpose has been to crush General Grant and Senator Conkling, and thereby open the way for his renomination in 1884. In the President's madness he has wrecked the once grand Republican party, and for that he dies." And again: "This is not murder; it is a political necessity. It will make my friend Arthur President, and save the republic." The other papers were of similar tenor. There was evidence that, when arrested, the prisoner refused to talk, but said that the papers would explain all. On the night of the assassination the prisoner had said to the witness Brooks that he had thought over it and prayed over it for weeks; that he was satisfied that he had to do the thing, and had made up his mind and had done it as a matter of duty. He had made up his mind that the President and Secretary Blaine were conspiring against the liberties of the people, and that the President must die. In addition to this, the jury had the important testimony of Mr. Reynolds as to the prisoner's statements, oral and written, about a fortnight after the shooting. There he was found reiterating the statements contained in his other papers, and saying that the situation at Albany suggested the removal of the President, and that, as the faction fight became more bitter, he became more decided; that he knew that Arthur would become President, etc.

Judge Cox proceeded to quote from the address to the American people which was written and given to Mr. Reynolds:

"I now wish to state distinctly why I attempted to remove the President. I had read the papers for and against the Administration very carefully for two months before I conceived the idea of removing him. Gradually, as the result of reading the newspapers, the idea settled on me that if the President were removed, it would unite the two factions of the Republican party, and thereby save the Government from going into the hands of ex-rebels and their Northern allies. It was my own conception, and, whether right or wrong, I take the entire responsibility." A second paper, dated July 19th, addressed to the public, reiterated these statements, and added, "I have got the inspiration worked out of me." The jury had now before it everything emanating from the prisoner about the time of the shooting. There was nothing further from him until three months afterward. And now he would pass to consider the import of all this. The jury would consider, first, whether this evidence fairly represented the feelings and ideas that governed the prisoner at the time of the shooting. If it did, it represented a thing which he (Judge Cox) had not seen characterized in any judicial utterance as an insane delusion. They would consider whether it was evidence of insanity, or whether, on the contrary, it showed an ample power of reasoning and reflection on the arguments and evidence for and against, resulting in the opinion that the President had betrayed his party, and that, if he were out of the way, it would be a benefit to his party, and would save the country from the predominance of their political opponents. So far there was nothing insane in the conclusion. It had doubtless been shared by a good many heated partisans who were sane people, but the difference was that the prisoner reached the conclusion that to put the President out of the way by assassination was a

political necessity. When men reasoned, the law required them to reason correctly, so far as their practical duties were concerned. When they had the capacity to distinguish between right and wrong, they were bound to do it. Opinions, properly so called (that is, beliefs resulting from reasoning, reflection, and the examination of evidence), afforded no protection against the penal consequences of crime. A man might believe a course of action to be right, and the law might forbid it as wrong. Nevertheless, he must obey the law, and nothing could save him from the consequences of the violation of the law except the fact that he was so crazed by disease as to be unable to comprehend the necessity of obedience. [The court here quoted the decision of the Supreme Court in the Mormon case.] In like manner, he said, a man might reason himself into a conviction of the expediency and necessity of protecting the character of a political association, but to allow him to find shelter from punishment behind that belief would be simply monstrous. Between one and two centuries ago there had arisen a school of moralists who were accused of maintaining the doctrine that, whenever the end to be attained was right, any means necessary to its attainment were justifiable. Consequently, they incurred the odium of nearly all Christendom. By that method of reasoning the prisoner seemed to have gotten the idea that, in order to unite the Republican party and to save the republic, whatever means were necessary would be justifiable; that the death of the President by violence was only a proper and necessary means of accomplishing it, and was therefore justifiable; and that, being justifiable as a political necessity, it was not murder. That appeared to be the substance of the idea which the prisoner had put forth to the world, and if this was the whole of his position, it presented one of those vagaries of opinion (even if it were sincere) for which the law had no accommodation, and which furnished no excuse whatever for crime. There was, undoubtedly, a form of insane delusion, consisting of a belief by a person that he is inspired by the Almighty to do something—to kill another, for example—and this delusion might be so strong as to impel him to the commission of crime. The defendant in this case claimed that he labored under such a delusion at the time of the assassination. His unsworn declarations in his own favor were not, of course, evidence, and were not to be considered by the jury. A man's language, when sincere, might be evidence of his condition of mind, but not evidence in his favor of the facts declared by him. He could never manufacture evidence in that way in his own exoneration. The law allowed a prisoner to testify in his own behalf, and therefore made his sworn testimony on the witness-stand legal evidence, to be received and considered, and given such weight to as it deserved. No verdict, however, could be safely rendered on the sole evidence of an accused party under such circumstances. Otherwise, a man on trial for his life could secure his acquittal by simply testifying that he had committed the crime under a delusion or inspiration, or irresistible impulse. That would be to proclaim a universal amnesty to criminals in the past, and unbounded license in the future, and courts of justice might as well be closed.

He would say a word about the characteristics of that form of delusion. The idea of being inspired to do an act might be either a sane belief or an insane delusion. A great many Christian people believed not only that events were providentially ordered, but that they themselves received special providential guidance and illumination in respect both to their inward thoughts and their outward actions. But this was a mere sane belief. On the other hand, if a man sincerely, though insanely, believed that, like St. Paul on his way to Damascus, he had been smitten to the earth and had seen a great light and had heard a voice from heaven warning and commanding him to do a certain act, that would be a case of imaginary inspiration amounting to an insane delusion. The ques-

tion was, whether the case of this defendant presented anything analogous to that. The theory of the Government was that the defendant committed this homicide in full possession of his faculties and from perfectly sane motives; that he did the act from revenge, or, perhaps, from a morbid desire for notoriety; that he calculated deliberately on being protected by those who were to be benefited politically by the death of the President; that he made no pretense of inspiration at the time of the assassination, nor until he had discovered that his expectations from the so-called Stalwart wing of the Republican party were delusive; and that then, for the first time, he broached this theory of inspiration and irresistible pressure to the commission of the act. Whether this was true or not the jury must determine from the evidence. It was true that the term "inspiration" did not appear in the papers first written by the defendant, nor in those delivered to Mr. Reynolds, except at the close of the one dated July 19th, in which he said that the inspiration was worked out of him (although what was meant was not clear), and it was true, also, that that was after he was informed that he was being denounced by the Stalwarts. Judge Cox referred to the testimony of Dr. Noble Young, Dr. McDonald, and Dr. Gray, and this, he said, was about the substance of what appeared in the case on the subject of inspiration. The question for the jury was whether, on the one hand, the idea of killing the President first presented itself to the defendant in the shape of a command or inspiration of the Deity, in the manner in which insane delusions of that sort arose; or whether, on the other hand, it was a conception of his own, and whether the thought of inspiration was not simply a speculation, or theory, or theoretical conclusion of his own mind. If it were the latter, it was nothing more than one of the vagaries of reasoning, which he had already characterized as furnishing no excuse for crime. He had dwelt upon the question of insane delusion simply because the evidence relating to that was evidence touching the defendant's power or want of power (from mental disease) to distinguish between right and wrong as to the act done by him. This was the broad question for the jury to determine, and was what was relied upon by the defense. It had been argued with force on the part of the defense that there were a great many things in the defendant's conduct which could not be expected of a sane man, and which were only explainable on the theory of insanity. There were strange things in his career, and whether they were really indications of insanity, or could be accounted for by his ignorance of men, by his exaggerated egotism, or by his bluntness of moral sense, it might be difficult to determine. The only safe rule, however, was for the jury to direct its attention to the one test of criminal responsibility, namely, whether the prisoner possessed the mental capacity, at the time the act was committed, to know that it was wrong, or whether he was deprived of that capacity by mental disease. There was one important distinction which the jury must not lose sight of, and they must decide how far it was applicable to this case. That was the distinction between mental and moral obliquity; between the mental incapacity to distinguish between right and wrong, and the moral insensibility to that distinction.

In conclusion, he said:

From the materials presented to you two pictures have been drawn to you by counsel. The one represents a youth of more than average mental endowments, surrounded by certain immoral influences at the time his character was being developed; commencing life without resources, but developing a vicious sharpness and cunning; conceiving "enterprises of great pith and moment" that indicated unusual forecast, although beyond his resources; consumed all the time by unsated egotism and a craving for notoriety; violent in temper, selfish, immoral, and dishonest; leading a life of hypocrisy, swindling, and fraud; and finally, as a culmination of his de-

praved career, working himself into the resolution of startling the world with a crime which would secure him a bad eminence. The other represented a youth born, as it were, under malign influences—the child of a diseased mother and of a father subject to insane delusions, reared in retirement and imbued with fanatical religious views; subsequently, his mind filled with fanatical theories, launched on the world with no guidance save his own impulses, evincing an incapacity for any continuous employment; changing from one pursuit to another—now a lawyer, now a religionist, and now a politician—unsuccessful in all; full of wild, impracticable schemes, for which he had neither resources nor ability; subject to delusions; his mind incoherent and incompetent of reasoning coherently on any subject; with a mind so weak and a temper so impressionable that he became deranged, and was, therefore, impelled to the commission of a crime the seriousness of which he could not understand. It is for you, gentlemen, to determine which of the portraits is the true one.

And now, gentlemen, to sum up all I have said to you, if you find from the whole evidence that at the time of the commission of the homicide the prisoner was laboring under such a defect of his reason that he was incapable of understanding what he was doing, or of seeing that it was a wrong thing to do—as, for example, if he were under the insane delusion that the Almighty had commanded him to do the act—then he was not in a responsible condition of mind, but was an object of compassion and should be now acquitted. If, on the other hand, you find that he was under no insane delusion, but had the possession of his faculties, and had power to know that his act was wrong; and if, of his own free-will, he deliberately conceived the idea and executed the homicide, then, whether his motive were personal vindictiveness, political animosity, a desire to avenge supposed political wrongs, or a morbid desire for notoriety; or, if you are unable to discover any motive at all, the act is simply murder, and it is your duty to find a verdict of guilty as indicted. Or, if you find that the prisoner is not guilty by reason of insanity, it is your duty to say so. You will now retire to your room and consider your verdict.

The jury retired at 4.40 P. M., and shortly afterward the court took a recess until 5.30. Some time before the court reassembled, or within thirty minutes from their retirement, the jury intimated that they had agreed upon a verdict. When order had been restored after the recess, the foreman of the jury, in answer to the customary question as to the verdict, answered, "Guilty as indicted." On the demand of Mr. Scoville, the jury was polled, and at the call of his name each jurymen answered, "Guilty." As the last name was called, the prisoner shrieked: "My blood will be upon the heads of that jury. Don't you forget it!" Mr. Scoville again addressed the court, saying: "Your Honor, I do not desire to forfeit any rights I may have under the law and practice in this District. If there is anything that I ought to do now to save those rights, I would be indebted to your Honor to indicate it to me." Judge Cox, in reply, assured him that he should have every opportunity; that the charge would be furnished to him, in print, and he would be accorded all the time allowed by law within which to file his exceptions, and that he would also be entitled to four days within which to move in arrest of judgment. Guiteau called out in tones of desperation, "God will avenge this outrage!" Judge Cox then turned to the

jury and said: "Gentlemen of the jury, I can not express too many thanks for the manner in which you have discharged your duty. You have richly merited the thanks of your countrymen, and I feel assured you will take with you to your homes the approval of your

consciences. With thanks, gentlemen of the jury, I dismiss you." With this announcement, the court was declared adjourned.

Subsequently a motion for a new trial was overruled, and the prisoner was sentenced to be hanged on the following June 30, 1882.

H

HALSTED, RICHARD FREDERICK, died May 24, 1881, in Sing Sing, N. Y., in the fiftieth year of his age, having been ill during ten years, for five of which he was almost totally blind. At the outbreak of the civil war he was first lieutenant in the sixth company of the Seventh Regiment, New York State National Guard. He accompanied that regiment on its first march to Washington. He entered the United States service, June 14, 1861, as major of the Fortieth Regiment, New York Volunteers. On April 26, 1863, he was appointed aide-de-camp to General Sedgwick, and was with the Army of the Potomac until its disbandment, when he went to the Department of Texas. He served with Major-Generals John Sedgwick and H. G. Wright as staff-officer, and under division commanders Heintzelman, C. S. Hamilton, and Kearney. He was also in the Sixth Corps, and temporarily in the Second and Ninth, General Sedgwick having been assigned to these before taking command of the Sixth Corps. With this corps he made the Shenandoah Valley campaign, and was engaged at Williamsburg, Fair Oaks, the Seven Days, and Fredericksburg (the second battle where the Sixth Corps fought alone, the balance of the army being at Chancellorsville), Marye's Heights, Salem Heights, Gettysburg, Rappahannock Station, the Wilderness, and the following days, until the death of Sedgwick, May 19th, when he came home with his remains. Returning to his command June 1st, he was at Cold Harbor, in two engagements at Winchester, Fisher's Hill, Cedar Creek, besides many skirmishes, the movement against Early at Washington, and the crossing of the Shenandoah by the Sixth Corps. He was brevetted major and lieutenant-colonel of volunteers, and resigned July 1, 1866.

HAVEN, ERASTUS OTIS, born in Boston, November 1, 1820; died in Salem, Oregon, August 2, 1881. He graduated from the Wesleyan University in 1842, and was for some years an instructor at Sudbury, Massachusetts. In 1846 he was appointed Principal of the Amenia Seminary, New York, and held this position during two years. In 1848 he entered on the itinerant ministry of the Methodist Episcopal Church, and was first stationed in New York, where he was a pastor until 1853, when he became a Professor of Greek and Latin in the University of Michigan. In the following year he was appointed Professor of the English Language, Literature, and History in

the same institution. From 1856 to 1863 he was editor of "Zion's Herald," a journal published in Boston. In 1862 he was elected a member of the Massachusetts Senate, where he served two years, and was specially prominent as an advocate of educational interests. He was also a member of the State Board of Education. In 1863 he became President of the University of Michigan, and held that position until 1869. Under his administration the university doubled in numbers and resources, becoming one of the largest in the country. Bishop Haven was next appointed President of the Northwestern University, at Evanston, Illinois, and continued to hold that office three years, giving entire satisfaction. From 1872 to 1874 he was Corresponding Secretary of the Board of Education of the Methodist Episcopal Church. In 1874 he was elected Chancellor of the Syracuse University, and in 1880 was made bishop. In 1881 he was assigned to San Francisco and the Pacific coast generally. He was a member of five general conferences, and the author of "The Young Man Advised" (1855), "Pillars of Truth" (1860), and "Rhetoric, a Text-Book for Schools" (1869).

HAYMERLE, HEINRICH CARL, BARON, Prime Minister of Austria, died at Vienna, October 10th. He was born at Vienna in December, 1828, of German parents who had been living for some time in Bohemia. After studying in the Vienna School for the Oriental Languages, he found a position as assistant interpreter to the Austrian embassy at Constantinople in 1850. During the Crimean War he was sent on a mission to Omer Pasha for securing protection to Austrian subjects. In 1857 he was sent to Athens as secretary of legation, and acted there for a time as *chargé d'affaires*. He was secretary of legation at Dresden and at Frankfort. After the war of 1864 he was intrusted with a mission to Copenhagen for the object of re-establishing friendly relations with the Danish Government. Returning to Frankfort in 1866, he took part in the negotiations connected with the Treaty of Prague. He was then transferred to Berlin, where he was *chargé d'affaires* until 1868. He was ennobled in 1867. Called to the Ministry for Foreign Affairs by Count Beust, he again went to Constantinople and from there to Athens as *chargé d'affaires*. He was appointed Ambassador to Rome in 1877. At the Berlin Conference in 1868 he acted as the third Austrian delegate. When Count Andrassy re-

signed the premiership in 1879, Haymerle was called to succeed him. The duty fell to him of carrying out the stipulations of the Austro-German treaty of alliance concluded by Andrassy.

HEARING, OR COLOR-HEARING. This latter expression has been applied to a phenomenon, of which some few persons are conscious. It is the appearance of certain colors accompanying the perception of music-sounds or noises. In 1873 Nussbaumer described this double perception, as he and his brother had it, and Herren Bleuler and Lehmann, in Zurich, have recently made a more systematic study of the subject. The colors attending notes differ in different individuals. Generally the higher notes are accompanied by lighter colors, and the lower by darker. Chords either cause the colors which correspond to their notes to appear side by side, or give a mixture of those colors. A thorough musician who was examined perceived a distinct color with each key—viz., C major, gray; G flat major, reddish brown; A major, blue; A minor, lead-color; F sharp major, yellow; and so on. The same note in different keys changes in color according to the color of the key in which it is found. To many persons, too, the same piece played by different instruments appears in different colors. Noises, again, are generally accompanied with colors, these being usually of a gray or brown hue. Increased intensity of sound affects the color perceived, and more so in the case of noise than in that of musical notes: in the latter the intensity of color is increased; in the former a transparent effect observed gives way in some measure to opacity. These writers pursue their studies into the colors some minds perceive on hearing consonants, vowels, diphthongs, words, etc., some of which cases seem to be explicable by direct "association." By four persons sound was perceived as a result of sensations of light and color—e. g., a broad, quietly-burning gas-flame led to perception of a sound constructed of *o* and a light vowel like *e*. When the flame flickered the sound grew similar to *l*. In color-hearing no essential difference between the two sexes has been demonstrated. Of 76 "color-hearers," 59 per cent were males and 41 per cent females. The percentage of "color-hearers" in 596 individuals examined was only 12.5. The phenomenon is to a great degree hereditary.

HEATING OF HOUSES. Engineers have been experimenting in Great Britain, with satisfactory results, upon the warming of buildings, with reference to the avoidance of smoke and the economy of fuel. Dr. C. W. Siemens has devised an arrangement for burning coke and gas together in an open fire-place, by which a greater heating effect is obtained than from coal or from coke alone, and at a lower cost than either of those fuels. Coke is the more perfect fuel of the two, because none of the calorific effect is diverted to the volatilization

of the hydrocarbons and ammonia of the natural coal. From 100 pounds of the best English coal 66 pounds of coke, containing 6 pounds of earthy matter, and 34 pounds of volatile matter, comprising, besides water-vapor, ammonia, and tar, 16 pounds of pure combustible gas, are obtained in the gas-retort. The 60 pounds of solid carbon contained in the coke develop in combustion 870,000 heat-units; the 16 pounds of illuminating gas on burning give forth 352,000 heat-units. From the sum must be deducted 60,000 units, the approximate amount of heat required for liberating the volatile constituents of the coal, and heating the coke to redness, leaving 11,600 heat-units per pound as the maximum heating effect that can be obtained from coal. In practice only a small part of this is utilized, only about one eighth of the possible maximum being obtained in the best steam-engines. In domestic economy the loss of heat is much greater still. Coke alone is very hard to burn in a chimney-fire, and burns without flame. Both these objections are removed by Dr. Siemens's ingenious grate, in which jets of gas are used to ignite the coke, increase the heat, and afford a cheerful flame. His grate is admirably constructed to throw out the largest possible proportion of the heat into the apartment. Besides being absolutely smokeless, the coke-gas fire heats better than any coal-fire, it can be regulated at will, it is lighted without trouble, requires no stirring, and the fuel costs less than coal. The cost per day of nine hours, at London prices, was found to be 2-604*d*. for 62 cubic feet of gas at 3*s*. 6*d*. per thousand, and 2-121*d*. for 22 pounds of coke at 18*s*. per ton, in all 4-725*d*. per day, or 527*d*. per hour, against 5-7*d*. per day, or 633*d*. per hour for a coal-fire taking 47 pounds of coal a day at 23*s*. a ton. In the process of separating gas from coal the marsh-gas, which is of low illuminating power, leaves the coal first, and the olefant and acetylene gases afterward. If a double system of reservoirs and mains were used in cities, the former could be drawn off and served for heating purposes, for which it is admirably adapted, being less likely to produce soot than the other gases, while they are greatly superior as illuminants.

HENNI, JOHN MARTIN, born 1805, in Canton Graubünden, Switzerland; died September 7, 1881, at Milwaukee, Wisconsin. Archbishop Henni was one of the oldest Catholic prelates in America. He studied at St. Gallen and Lucerne, and, after graduating, visited Rome in furtherance of his aspirations to the priesthood. He emigrated to America in 1829, at the request of the Rt. Rev. Dr. Fenwick, Bishop of Boston. The same year he was consecrated to the priesthood. Cincinnati and Canton, Ohio, were the first scenes of his ministerial labors, and soon after that he became Vicar-General of the diocese. In 1835 he visited Europe for financial aid, and was most successful in his efforts, and, on his return, he estab-

lished St. Aloysius Orphan Asylum, and a Catholic periodical. On March 19, 1844, he was consecrated as the first Catholic Bishop of Milwaukee, by Bishop Purcell. As soon as the bishop entered upon his duties, he began to display great zeal and enthusiasm. In 1847 St. Mary's Church was consecrated, the number of priests increased to thirty, the cornerstone of a new cathedral laid, and St. Mary's Hospital founded. In 1848 he visited Europe for funds a second time, but was not altogether successful, on account of the French Revolution. On his return he ordered the work of the cathedral to be stopped for a time, as the money intended for it was wanted for the more urgent need of an orphan asylum. Hoping to replace the funds necessary to complete the cathedral, the bishop went to Mexico and Cuba, where he collected money enough for the requirements of his diocese. In 1853 the new cathedral was consecrated. His next work was the diocesan seminary, which by the year 1860 was freed from all money incumbrances, and had one hundred and twenty-five students. In 1875 he was made first Archbishop of Milwaukee, and in February, 1879, celebrated the fiftieth anniversary of his priesthood. On this occasion of his "golden jubilee" more than a hundred clergymen and nine bishops were present. Services of great solemnity were conducted in St. John's Cathedral, a fine edifice founded by Archbishop Henni. In a diocese established only thirty-seven years, through the untiring toil and wise administration of its first bishop, a cathedral church has been built and consecrated, 262 ordinary churches, 24 chapels, and 25 stations established, an ecclesiastical seminary, 13 religious communities, 11 charitable institutions, a normal school, 3 male academies, and 5 female. There are 185 secular and 38 regular priests.

HIDDENITE. A new mineral, which has hitherto been found only in a single narrow vein in Alexander County, North Carolina, has been introduced by the jewelers, and accepted as a gem of the highest order. It is a green stone of extraordinary brilliancy, hardness, and transparency, possessing a peculiar color, very vivid and intense. The new gem is called *hiddenite*, from the name of its discoverer, W. E. Hidden. It was at first classed as diopside, from its green hue, transparency, and nearly identical crystalline form and properties; but was afterward, when it was attempted to detect the cause of its color by chemical analysis, identified as a variety of spodumene. This mineral species differs only a fraction of a degree from diopside in its prismatic angle, and resembles it also in possessing an easy cleavage in two directions. The present emerald-green variety is of a uniform prismatic crystalline form. The crystals show a considerable variety in habit. Twin crystals are common. The planes of the fundamental prism are pitted with remarkable little depressions of rhomboidal shape, the outlines of which are paral-

lel to the prismatic edges. The same wedge-shaped hollows occur with less frequency on the other planes, and appear also in the cleavage. The crystals vary in length from $\frac{1}{2}$ to 2 or 3 inches. They are usually very slender, though sometimes having a thickness in the direction of the clinodagonal axis of $\frac{1}{2}$ to $\frac{1}{4}$ inch; in the other transverse direction they are much thinner. No previously discovered variety of spodumene has any value for jewelers' purposes. Like beryl, it is a mineral which occurs in large crystals, but either opaque or with only a trace of color. The beauty and rarity of the hiddenite distinguish it from the other varieties of spodumene as the emerald is distinguished from the other beryls. The latter species is of much commoner occurrence than spodumene. The hiddenite is the most beautiful and valuable of American gems, and is the only precious stone found solely in the United States. It possesses all the qualities most valued in precious stones—rarity, brilliancy, and evenness of color, transparency, and excessive hardness, and immediately took rank among the most costly gem-stones. It has brought the same price per carat as diamonds, and one large stone, weighing $2\frac{1}{2}$ karats, has been sold for over \$125 a carat, though not a perfect specimen. The name given to it by lapidaries is the *lithia-emerald*. It was so named on account of the presence of over seven per cent of lithia in the stone, a substance which is not found in the beryl emerald. Lapidaries find it a difficult stone to cut, on account of its perfect cleavage in two directions. The coloring matter to which its peculiar and beautiful green hue is owing has not been discovered, but is probably vanadium, the coloring agent in variscite. The discovery of the new mineral was first announced by Professor Hidden in 1879, but it was first observed by I. A. D. Chamberlain in 1876. The color of the finest crystals is a deep emerald-green. Owing to their dichroism, the gems cut from them possess a peculiar fire, which is wanting to the true emerald.

HOLLAND, JOSIAH GILBERT, born in Belchertown, Massachusetts, July 24, 1819; died in New York city, October 12, 1881, aged sixty-three. Dr. Holland graduated at the Berkshire Medical School in Pittsfield, Massachusetts, and practiced his profession three years. He then removed to Springfield, Massachusetts, where he edited a literary paper for a short time. Going to Vicksburg, Mississippi, he lived there a year as Superintendent of Public Schools, after which he returned to Springfield and became, in 1849, associate editor of the "Republican," and, two years later, one of the owners of that paper. His connection with the "Republican" continued until 1866, when he sold his entire interest in it, and withdrew from newspaper business, although his career in journalism had been prosperous and lucrative. During his association with the "Republican," Dr. Holland entered upon the

literary work that afterward won for him such wide and flattering popularity. His first book, "History of Western Massachusetts," was published in 1855, and was succeeded by a novel entitled "The Bay Path," in 1857. This work seemed not to succeed very well, and the next year he began to publish, under the pseudonym of "Timothy Titeomb," the remarkable series of letters which made the assumed name of the author a household word. For these letters he experienced some difficulty in finding a publisher, but finally Mr. Charles Scribner recognized their merit, and, seeing for them a grand success, published them in 1858. During this year Dr. Holland made his first venture as a poet, and gave to the public his famous "Bitter-Sweet," a poetical tale of New England life, which has passed through more editions than any other American poem, with one exception. "Gold Foil" followed in 1859, and the year after the author of these successful works ventured another novel, "Miss Gilbert's Career." "Lessons in Life" appeared in 1861, "Letters to the Joneses" in 1863, "Plain Talk on Familiar Subjects" in 1865, and a "Life of Abraham Lincoln" in 1866. For this biography the publishers offered him three thousand dollars; he demanded five, but subsequently agreed to a compromise by which the author was to receive twenty cents on each copy sold. As more than 100,000 copies were sold, the arrangement proved satisfactory to Dr. Holland. "Kathrina," another narrative poem, was published in 1867, and this may be said to have marked the close of an epoch in the life of the man, as of the author. The following year he carried out his long-cherished wish to visit the Old World, where he traveled in England, Scotland, France, Belgium, Germany, Switzerland, Italy, and Austria. His tour seemed not to realize his expectations, and his pen made no pictures of the "beaten track" over which so many writers have wandered. At Geneva, with Mr. Roswell Smith, he conceived the idea which he afterward wrought out in "Scribner's Magazine." Long previous to this Mr. Scribner had solicited Dr. Holland to go to New York and edit a journal there known as "Hours at Home," but this offer did not meet the ambitious views of a mind eager for a literary enterprise unencumbered by traditions. In 1870 Dr. Holland, as editor and one third owner, began publishing "Scribner's Magazine," with Roswell Smith and Scribner, Armstrong & Company as joint owners.

It was a success from the first. During his conduct of this journal he found time for other literary labor, and in 1872 published "The Marble Prophecy." "Arthur Bonnicastle" appeared in 1873, and in the same year came "Garnered Sheaves," a collection of poems. In 1874 "The Mistress of the Manse," a novel, was issued.

Dr. Holland's contributions to other magazines than his own were not profuse. A few to "Hours at Home" and the "Atlantic

Monthly" are among his articles for contemporary journals. As a lecturer he was extremely popular, having in the duldest seasons more invitations than he was able to accept, and always commanding a large price for his services upon the platform. A few years before his death his income from his various literary resources was estimated at \$25,000.

While the reputation of a great author has never been conceded to him, Dr. Holland justly held a very high rank in American literature, upon which his influence was confessedly pure and healthful. The unaffected directness of his style seemed to carry the vigorous freshness of his thought in a clear current to the deepest sympathies of his readers, and, if not so artistic as others, his delineation of character was always natural and forcible, leaving the reader with a sense of intimate acquaintanceship among the personages of his fiction. His volumes of "Letters to Young People" were full of excellent if not original counsel, conveyed in a manner so pleasing, sincere, and good-humored as to win the attention and enlist the interest of those he sought to benefit. As a poet his rank was in the second grade, but "Bitter-Sweet" and "Kathrina" are charming in the simplicity of theme and construction and the limpid purity of their sentiment. They leaped into popularity, and have never lost their hold upon the public fancy. His excellent ear for the music of verse and his command over forms of expression gave to his poems not unfrequently a lyrical power and sweetness of melody which caused them to sing themselves into the hearts of his readers. In his "Complaint" this quality is manifestly illustrated in the lines:

River, sparkling river, I have fault to find with thee;
River, thou dost never speak a word of peace to me.
Dimpling to each touch of sunshine, wimpling to each air
that blows;

Thou dost make no sweet replying to my sighing for repose.
This poem voices the thought of a grief-stricken soul, upon whom the joyousness and light indifference of Nature jar, but who recognizes that it is himself that is out of tune. A cardinal principle of Dr. Holland's editorial management was to develop American capacity in literature and art; and many writers and artists, whose reputations are now seenre, made their first appearance in "Scribner's Monthly." For such disinterested services the memory of this good man can not be held too gratefully, and his genial, large-hearted sympathy with all laudable ambition will long be sorely missed by the struggling talent of America. To the highest virtues of a Christian gentleman Dr. Holland added many of the most attractive social qualities that endear a man to his fellows. Nature had granted him the blessing of a fine and pleasing presence, to which his high culture lent increasing luster.

HUNGARY, a kingdom of Europe, and one of the two principal divisions of the Austro-Hungarian Monarchy (see AUSTRO-HUNGARIAN MONARCHY). The Hungarian Ministry, at the

close of 1881, was composed as follows: President of the Ministry and Minister of the Interior, Kolomon Tisza de Borosjenö; Minister near the King's person (*ad latus*), Baron Bela d'Orczy; Minister of Education and Worship, Augustus de Trefort; Minister for the Defense of the Country, Colonel B. Szende de Keresztes; Minister of Public Works, Paul d'Ordödy; Min-

ister for Croatia and Slavonia, Gabriel Baron de Pronay; Minister of Justice, Dr. Theodor Pauler; Minister of Finance, Count Szapary; Minister of Agriculture, Commerce, and Industry, Baron Kemény.

The area and population of the countries of the Hungarian crown are as follows, according to the census of December 31, 1880:

COUNTRIES.	Square kilometres.	POPULATION.		
		Male.	Female.	Total.
Hungary, Transylvania, and New Orsova.....	250,430.04	6,742,662	6,957,843	13,700,005
Fiume (free city).	19.82	9,985	11,378	21,363
Croatia and Slavonia.....	22,263.57	588,780	603,115	1,191,845
Military Frontier.....	20,332.01	354,355	343,161	697,516
Total.....	324,045.04	7,695,732	7,914,997	15,610,729

In the budget for Croatia and Slavonia for 1881, the receipts and expenditures were estimated at 3,603,464 florins.

The public debt of Hungary, at the beginning of 1880, amounted to 1,001,330,351 florins, exclusive of the common debt of the empire. Hungary also has a share in the liability for the public debt of Austria proper, about 30 per cent of its amount, previous to 1868, falling upon her. This debt is regarded as exclusively Austrian, but Hungary pays annually a fixed sum for interest and for amortization. The so-called common floating debt is guaranteed by both parts of the empire, and Hungary's share of this also amounts to 30 per cent. The assets of the state were estimated, in 1879, at 1,114,900,000 florins.

The Chamber in April adopted a bill providing for the levying of a statistical import tax. The amount was small indeed, but the measure still created considerable excitement in Austria, where it was regarded as the precursor of a complete customs-barrier between the two parts of the empire. The Austrian Minister of Commerce, as well as Count Taaffe, declared to a delegation of Austrian merchants that they could see in it no infringement of the customs and commercial union of the two countries.

The Diet passed, shortly before its adjournment in June, the bill regulating the commercial relations with Germany. It was generally regretted that nothing beyond a most favored-nation clause had been secured. Count Apponyi demanded a thorough change in the customs policy, and even attacked the customs union with Austria. M. Tisza, however, declared in reply that the damage for Hungary could not be estimated if two customs territories were to exist in the monarchy, and it might even happen in such a case that the export of Hungarian products to Austria would be entirely prevented.

New elections for the Diet were held throughout Hungary, from June 27th to July 4th, and resulted in large gains for the Government party, giving it a majority of over fifty in the new Diet. The Diet was opened on September 28th by the King. In his speech he announced

a convention with Serbia, laws regulating the relations of Fiume to Hungary, and called attention to the gradually approaching equality of receipts and expenditures. The debates on the address led to a declaration of M. Tisza that the authorities desired above all things a friendly relation between the soldiers and citizens, and that he would see to it that the citizens were protected against excesses of the military, as well as the military against the citizens.

The question of incorporating the Military Frontier with Croatia was finally settled in February, when the Hungarian and Croatian deputations came to an agreement. Croatia had demanded that it be granted an increase in the number of deputies to the Hungarian Diet, corresponding to its increase of population. This claim, which was strongly opposed by the Hungarians, the Croats finally dropped, and contented themselves with the six new deputies to which they were entitled in accordance with the increase of population in Croatia proper. The incorporation was completed by a royal decree of July 14th, which relieved the inhabitants of the Military Frontier from their arduous duty of protecting the empire against the invasion of the Turks, and placed them on the same footing as the inhabitants of the other parts of the empire.

The city of Fiume, which had been for some time a bone of contention between Hungary and Croatia, was in July finally given to Hungary. It had been assigned to Hungary by the compromise of 1868, but the Croats protested against this arrangement; in July, however, the Diet of Croatia, after a debate extending over two days, agreed to submit to the compromise.

The agitation against the Jews was also felt in Hungary during the year. An anti-Semitic meeting of students had been prohibited by the police in Budapest in March, and the Government was interrogated by M. Istoczy, who had on a previous occasion proposed to send all the Jews to Palestine. M. Tisza, in reply, stated that he would not interfere with free speech as long as there was no danger of breaches of the peace. Any meeting, however,

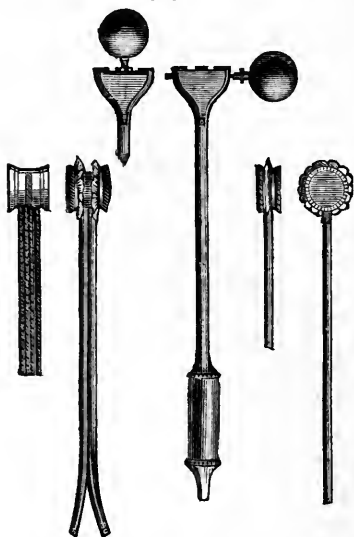

which assembled for the purpose of creating ill-feeling between different nationalities or creeds would be prohibited.

HYDRODYNAMIC ANALOGIES TO ELECTRICITY AND MAGNETISM. Though in our terminology the conception of electricity is still retained as an imponderable fluid pervading the interstices of matter, physicists have long since ceased to hold such a view. Like light, electricity is now regarded by them as due to the molecular vibrations of the bodies exhibiting the phenomena, and many refined researches have in late years been directed toward determining the form and characteristics of these vibrations in the electrically-excited body and in the intervening medium. Very considerable light has, during the year, been thrown upon this problem of electrical action by the remarkable experiments of Dr. C. A. Bjerknæs, of Christiania, Norway, who, by simple mechanical means, has succeeded in producing most of the fundamental phenomena of electricity and magnetism. The experiments are the more significant, from their being the outcome of mathematical analysis instead of due to accident. As has long been known, a vibrating tuning-fork, brought into the neighborhood of a light object, such as a small balloon, will attract it. This has been explained as due to the unequal air-pressure upon the opposite sides of the balloon, the air on the side toward the fork being rarefied by its excursion. It is this idea which Dr. Bjerknæs has carried out in his experiments—using, however, a liquid as the medium of his vibrations, instead of air. The motions produced were of two kinds, pulsa-

ter and thrown into vibration by means of air alternately forced in and withdrawn. As the apparatus supplying the air can be readily adjusted to varying conditions, vibrations of any rate can be produced at will. Operating with simple drums, in which the two flexible heads perform like motions at the same time, Dr. Bjerknæs found that when the motions of two drums were of the same phase—that is, when they were inflated and collapsed at the same time—attraction ensued; but when the phases were discordant—that is, when one drum was inflated while the other was collapsed—there was repulsion. By fixing one of the drums upon a light arm so as to allow it to revolve, these effects were shown in a very marked manner, the free drum approaching the other during attraction and moving away during repulsion. This effect illustrates the action between two magnets, though here the attraction occurs with like phases, and repulsion with unlike ones, while with magnets the reverse is true. Since both heads of the drum possess the same phase, it is analogous to an isolated pole of a magnet, or to a magnet having a succeeding point in the middle. In order to have two poles, it is necessary to use a double drum—that is, one divided into two compartments by a stiff partition. Each of these chambers must then be connected with a separate air-pump in both drums, which greatly complicates the apparatus. The desired effect can, however, be produced without this complication by using oscillating spheres, which present the two phases at the same time, one side advancing while the other recedes. Repulsion or attraction of the free drum can therefore be obtained simply by presenting to it one side or the other of the sphere. For the free drum a second sphere may be substituted, when similar phenomena will result. In the arrangement shown in Fig. 2, two spheres are carried on the ends of a light cross-bar free to move. If a third vibrating sphere be presented to either of these, rotation occurs, its direction depending upon whether there is attraction or repulsion. The effect is analogous to that of two short magnets mounted upon a cross-bar and free to revolve. If for the two spheres a single one be substituted, as shown in the dotted line, an effect is obtained similar to that of a short magnet hung on a pivot like a compass-needle.

Dr. Bjerknæs considers the water as analogous to Faraday's medium, and therefore attributes the effects, not to the mutual action of the bodies upon each other, but to the action of each body upon the liquid. In this view, when a vibrating body and the liquid have their motions in the same direction, the body moves away from the center of disturbance, and toward it when these motions are in opposite directions. If a vibrating sphere be brought near a ball of cork, kept in the liquid by a thread, repulsion results, the phenomenon corresponding to diamagnetism. If, however,

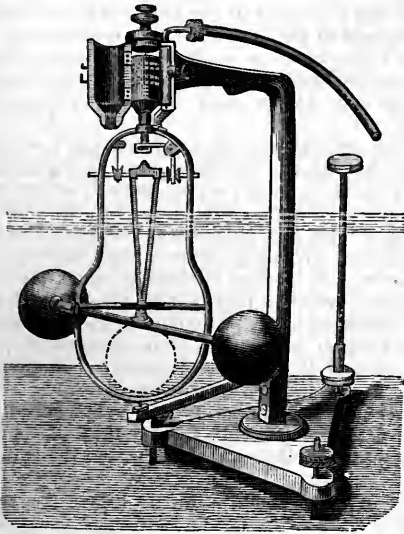

FIG. 1.

tions and oscillations, the former being made by small drums with flexible heads, and the latter by flexible spheres, such as are represented in Fig. 1. These are immersed in wa-

a ball heavier than the liquid be substituted for the cork, attraction ensues, presenting an analogy to paramagnetism. The explanation of these effects is that, in the first case, the oscil-

FIG. 2.

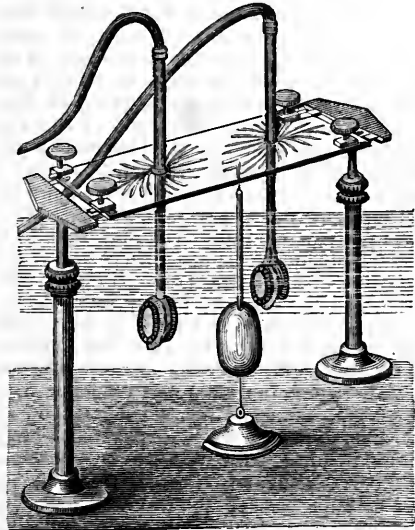

lations of the cork are greater than the water, and are hence relatively in the same direction, while in the latter case the movement of the ball is less than that of the water, and consequently, relatively to it, opposite in direction. These effects are very clearly shown by an apparatus in which a rod of cork and one of metal are immersed in the liquid. On bringing near to them a vibrating drum the cork sets itself equatorially, and the metal rod axially.

By a very simple piece of apparatus, illustrated in Fig. 3, Dr. Bjerknes succeeded in reproducing the well-known magnetic curves taken by iron filings when brought near the pole of a magnet. To do this he mounted a cylinder or sphere upon a spring and affixed to its upper part a fine paint-brush. When the vibrating drums or spheres were caused to move in the neighborhood of this, it was thrown into vibration, and its movement traced by the brush upon a glass plate placed above. In this way the curves for all the different vibrations are graphically depicted. With two drums pulsating concordantly the figure is exactly like that assumed by iron filings in a field of two

similar magnetic poles, while, when they are discordant, the figures are those of two unlike magnetic poles.

As the outcome of these experiments and his mathematical analysis, Dr. Bjerknes considers magnetism to be a rectilinear vibration instead of a kind of molecular rotation, as physicists

FIG. 3.

have been wont to regard it. On this view an electric current would be a circular oscillation, the direction of the current being the axis of oscillation. The experimental illustrations of the effects of a current are much more difficult than those of magnetism, as there are required, instead of bodies in vibration, bodies in alternating rotation, and so far but a few of the more simple ones have been made. It was found necessary, to produce friction enough, to use a viscid fluid instead of water, which introduced various difficulties hard to overcome. Tracings of the figures produced by his moving bodies were, however, obtained and found to agree exactly with those produced on a glass plate by iron filings in the neighborhood of electric currents. Dr. Bjerknes is still occupied with carrying on his mathematical investigations, and devising means for their experimental demonstration. Such studies can not but be of the greatest value, as giving clear ideas of the mechanism of electric action.

I

ICE, HOT. Professor Thomas Carnelly has discovered that ice and other bodies under exceedingly low pressures will not pass into the liquid state, but remain solid when the temperature is raised far above their melting-points, and then vaporize directly. Water was

congealed in thin layers about a thermometer-bulb in an ample Torricellian vacuum, and on the sides of the vessel, in which the pressure did not exceed 1.0 to 1.5 millimetre. The vessel was a tube of glass, inclosing the thermometer, and communicating with a bottle above

in which the vapor given off in a partial fusion of the ice was instantly congealed, and so did not alter the pressure. Boiling water was introduced into the tube below the thermometer through the mercury-trough. It was first frozen by means of the application of a freezing mixture. The mass of solid ice in the tube was melted by a Bunsen flame, the upper part of the ice-column fusing with difficulty. On grasping the tube with the hand, violent ebullition took place, causing the water to splash up the sides of the tube and on the bulb of the thermometer, where it froze in thin layers. Upon the application of the flame of the Bunsen's burner the ice on the walls of the tube partly gave way; the rest and that on the bulb remained solid, while the thermometer rose to temperatures between 120° and 180°, and when the ice yielded to the heat it immediately volatilized without melting. The first melting of the solid column of ice and of portions of the layer which afterward formed on the sides of the tube, are ascribed to imprisoned steam and the pressure caused by it. In one experiment, in which the heat applied was so strong as to cause the fusion of the ice on the sides of the bulb, when the lamp was removed for a few seconds the water congealed again on the bulb, though the glass was so hot that it could not be touched without burning the hand. The surprising character of these results caused some to doubt the testimony of the thermometer; but calorimetric tests proved that the temperature of the ice actually rose as indicated. Mercuric chloride was found to remain solid under diminished pressure, at temperatures far above its melting-point, and even above its boiling-point. With this substance the reverse of the experiment with ice was tried, and the fact of there being no intermediate liquid state between the solid and the gaseous at these minimum pressures was confirmed. The chloride was liquefied and brought to a boil at the ordinary pressure. Then the pressure was reduced by a Sprengel pump. The boiling-point was lowered under the diminished pressure, being carried below the usual melting-point to the point at which it ordinarily resolidifies, at which temperature the boiling liquid began to solidify. The solid mercuric chloride obtained under these conditions differed greatly in appearance from that solidified in the ordinary way, consisting of a mass of pearly leaves closely packed together around the thermometer-bulb.

ILLINOIS. The sessions of the Legislature of Illinois are held biennially, and commence on the Wednesday after the first Monday of January. The day of opening the last session was the 5th of January. In the House, W. W. Thomas was chosen Speaker; and in the Senate Lieutenant-Governor Hamilton presided.

The session continued until the 1st of June. During its period there were in all 1,167 bills introduced—456 in the Senate and 711 in the House. Of these, 124 passed and reached the

Governor. The Senate passed 121 bills, of which 59 got through the House, and 65 House bills. The House passed 131 of its own bills, and 59 Senate bills.

One of the earliest movements in the Legislature related to the subject of temperance. A bill was presented in the House which forbade the grant of any license to keep a dram-shop in any town or ward or election district, except on the petition of a majority of the inhabitants, male and female, over twenty-one years of age.

The prohibitory nature of this bill was such that its passage was impossible in the House, and the movement took the form of an amendment to the State Constitution by a vote of the people. For this purpose the following amendment was proposed: "No person shall manufacture, sell, or keep for sale, in this State, any alcohol, whisky, high-wines, wine, ale, beer, or other intoxicating liquors whatever, except for medical, scientific, and manufacturing purposes, and the General Assembly shall enforce this article by appropriate legislation."

At the same time the State Temperance Alliance held a convention at the capital. It was numerous attended, and adopted the following resolution:

Resolved, That while we can not indorse the principle of licensing the sale of intoxicating liquors, and believe the whole theory of licensing evils to be impolitic and wrong, nevertheless, as the present laws look toward the repression of some of the evils incident to the traffic, we pledge ourselves to use all means in our power to enforce them.

The sentiment of the House relative to some portion of the management of railroad corporations and their property found expression in the adoption of the following resolutions, without discussion:

Whereas, The published reports of the leading railroads chartered and operating under the laws of this State show a constantly increasing surplus of net earnings, enabling the managers to pay large dividends, not only upon the cost of the roads, but in many cases upon a fictitious "watered" capital; and

Whereas, At common terminal points the freight and passenger traffic of the railroads is pooled or adjusted by "eveners," and injurious discrimination is made in favor of "through business," and in favor of certain cities, as against other cities where there are no competing lines of railroad, thus depriving the people of the benefit and protection of competition to which they are justly entitled; and

Whereas, We hold the true principle to be that, when the capital actually invested in a railroad has been fairly compensated, the rest of the benefits and advantages resulting from the construction of said railroad belong to, and should be enjoyed by, the people; and

Whereas, Under the existing laws of Illinois and the present mode of assessing railway property, said property does not bear its proportionate share of the taxes and expenses of the government; therefore, be it

Resolved, That the Committee on Railroads be instructed to report to this House, with the least possible delay, a bill for enactment containing the following provisions:

1. A bill to prevent the pooling of traffic-earnings at any and all competing points in this State wherever two or more companies are operating railroads.

2. Bill making it a penal offense for the managers of any railway company to allow a shipper of freight any kind of rebate or drawback whereby such shipper secures benefits and advantages over others.

3. A bill requiring the managers of all railroad companies to make a full and complete statement, under oath, to the Railway Commissioners, of the actual cost of their respective railway properties, including equipment, and excluding all increase of stock not based upon *bona fide* expenditures of construction, and further requiring such railway managers to make a semi-annual statement of the gross receipts and expenditures, together with the fixed charges of such roads, and empowering the Railway Commissioners to require of any railway company a reduction if its freight and passenger tariff-earnings (after payment of all fixed charges) for twelve consecutive months shall exceed in amount the sum required to pay six per cent per annum upon the actual cost of such railways.

4. A bill changing the present mode of assessing railway property, and containing a provision that will insure in the future such property bearing its fair proportion of the burdens of taxation.

5. A law forbidding unjust discrimination in favor of cities where there are competing lines of railroad, as against cities and stations where there is but one line; also preventing discrimination in favor of through freight and passenger traffic, as against local traffic, and in favor of large shippers, as against small shippers.

6. A bill requiring all railroads chartered by this State to have a stock-transfer office located at some accessible point within the State, and the stock-books to be kept open for the inspection of any stockholders in such company.

7. A bill making it a penal offense for the managers of any railroad company to issue stock in excess of the cost of such road, after deducting the amount received from the sale of its bonds. Also, promising additional stock based upon an increase or supposed increase in value after completion, or in any manner adding to, or "watering" its capital stock; and also prohibiting railroad companies from paying dividends upon any such fictitious stock.

No acts, however, were passed relating to the subjects of these resolutions.

An unsuccessful effort was also made to effect the passage of a bill known as "the Compulsory Education Bill." The bill was introduced into the Senate early in the session and referred to the Committee on Education. This committee reported it with a recommendation of its passage. The main feature of the bill was contained in its first section, which was as follows:

That every parent, guardian, or other person having control and charge of any child or children between the ages of eight and fourteen years, shall be required to send any such child or children to a public school for a period of at least twelve weeks in each school year, which is to commence on the first Monday in September, and at least six weeks of which shall be consecutive, unless such child or children are excused from such attendance by the Board of Education or school directors of the city, town, or district, as the case may be, in which its parents or guardians reside, upon its having been shown to their satisfaction that the bodily or mental condition of such child is such as to prevent its attendance at school or application to study for the period required, or that such child is taught in a private school or at home, in such branches as are ordinarily taught in the public schools. Provided, that in case a public school shall not be taught for three months during the year within one and one half mile, by the nearest traveled road, of the residence of any such person within the school district, he shall not be liable to the provisions of this act.

An important act was passed to prevent and punish the adulteration and sale of any article of food, or drink, or medicine. This act went into operation on July 1st. Its provisions are of a stringent nature. It is based upon the present British statute, which was enacted after an experience of twenty years, in the course of which it was shown that it was not possible to carry statutes of this kind too far. The act of the Illinois Legislature provides that no person shall mix any food or drink with any ingredient so as to render the article injurious to health, or to depreciate its value, and that no person shall offer such articles of adulterated food or drink for sale; that like adulterations in medicines shall be unlawful; that no ingredients, even when not of a harmful character, shall be incorporated in any article of food, or drink, or medicine, unless the true name of the ingredients shall be stamped upon the package, or unless the purchaser shall be informed by the seller of the true name of such ingredients; that no mixture of oleomargarine, fat, or other foreign substance, shall be added to butter or cheese except upon similar conditions. The penalties are, for the first offense, a fine of \$25 to \$200; for the second offense, of \$100 to \$200, or confinement in jail of from one to six months; for the third offense, fine of from \$500 to \$1,000, and imprisonment from one to five years.

This law makes two distinctions: First, that no article which is injurious to health shall be mixed in any manner in any food, or drink, or medicine, under criminal penalties; second, that where harmless ingredients are added, the name of such ingredients shall be clearly marked upon each package, or the seller shall notify the buyer of the adulteration and its character. The first provision makes adulteration a crime; the second makes it a fraud. There of course can be no objection to the exclusion from all food of articles of adulterations which are positively dangerous to health. It was feared that the provisions of the sixth section might do much to defeat the object of the act. That section provides that no person shall be convicted under the act if he shall show "to the satisfaction of the court or jury that he did not know he was violating the act," and that he could not, with respectable diligence, have obtained the knowledge. It involves a principle totally at variance with one of the fundamental principles of law. Every man is bound to know the law, and may not plead his ignorance of it, yet this adulteration act permits an accused person to make an exhibit to court and jury of his conscience, his thoughts, and his mental processes. It is difficult to see what standard can be set up by which a court or jury is to be satisfied as to the mental processes of a person who may have dealt in adulterated goods, especially when on trial for a first offense.

An act was passed to provide such means as would prevent and suppress the spread of

pleuro-pneumonia among cattle. It empowers the Governor to appoint a State Veterinarian, who shall have authority to order a quarantine of infected premises and slaughter of diseased animals, and provides for appraisement of their value and payment of the same. It also empowers the Governor, when the necessity exists, to prohibit the importation of live-stock believed to be infected, unless they can furnish a certificate of health. A heavy fine for non-compliance is imposed. It also makes the failure to report any case of pleuro-pneumonia, by any person having infected cattle upon his premises, a misdemeanor. The State Veterinarian is allowed \$8 per day for each day actually employed, and \$2,000 to use in disinfecting premises, etc., and \$8,000 is appropriated to pay for slaughtered animals.

The traffic in deadly weapons is regulated by another act which prescribes the conditions of their sale and prevents minors from becoming purchasers. It is made a misdemeanor for any one to have, sell, or give away any slung-shot, metallic knuckles, or similar deadly weapons. Also to sell, loan, or give to any minor a pistol, bowie-knife, dirk, or similar deadly weapon. A fine of from \$25 to \$200 is provided as a penalty for carrying a concealed weapon of the kind specified, or a razor, or for flourishing any deadly weapon in a boisterous or threatening manner.

The law relating to marriages was so amended as to make those legal which were celebrated according to the form adopted by the Quakers.

The law of insurance was so amended as to add "tornadoes" to the list of causes of damage against which fire-insurance companies may insure.

The most important change in the revenue law was made by the passage of an act which provides for a return to the former system of annual assessments for real estate.

The manufacture of "bogus butter" is forbidden by the following section of another act:

That whoever manufactures out of any oleaginous substances, or any compound of the same other than that produced from unadulterated milk or cream from the same, any article designed to take the place of butter or cheese produced from pure unadulterated milk or cream of the same, or shall sell or offer for sale, or give to any person the same as an article of food, shall, on conviction thereof, be fined not less than \$25 nor more than \$200.

An act to regulate the practice of pharmacy was passed and went into operation on July 1st. It makes it unlawful for any person other than a registered pharmacist to retail, compound, or dispense drugs, medicines, or poisons, or to conduct a store for that purpose, unless such person is in the employ of a registered pharmacist, or shall put one in charge. The qualifications required for registration are that the person shall either be a graduate in pharmacy or medicine, or shall at the time the act takes effect be engaged in the drug business on his own account, or shall be a licentiate in

pharmacy. The Governor is to appoint a board, composed of five competent pharmacists. This board is to examine all applications for registration, to grant certificates and enforce the law. Penalties are provided for refusal to comply with the act. Also, for the adulteration of drugs and the sale of adulterated medicines, and for the sale of poisons by any but registered pharmacists.

The method of raising the revenue for State purposes was again agitated, but without any immediate result. At nearly every session, of late years, measures looking to a more thorough revision of the revenue system have been proposed. But the question has been a difficult one to deal with in the hope of giving entire satisfaction to the people. The Legislature has, therefore, generally adopted some temporary acts, and left the main question for future consideration. At the session of 1877, an important bill was prepared, and further considered in the session of 1879, but it failed to pass the House near the close of that session. During this session two measures of importance on the subject were presented in the House. The first proposed a radical change by putting upon corporations—railroad, express, telegraph, and insurance—the burden of providing revenue for State purposes. The second measure was presented under the form of the following resolutions, which were referred to the committee on revenue:

The Constitution provides that "the General Assembly shall provide such revenue as may be needful, by levying a tax by valuation so that every person and corporation shall pay a tax in proportion to the value of his or her or its property," and,

Whereas, Under the operations of the present revenue law of the State, no such proportion is observed; and,

Whereas, Said revenue law is cumbersome, unreasonably expensive, and unjustly discriminative in operation; and,

Whereas, The equitable apportionment of the burdens of taxation demands the radical revision of the revenue laws of this State; and,

Whereas, The time and circumstances of assembling of the General Assembly are inadequate and inconvenient to the proper consideration of this matter; therefore,

Resolved (the Senate concurring herein), That a commission of seven on revenue reform be created, three of whom shall be appointed by the Speaker of the House of Representatives, two by the President of the Senate, and two by the Governor, and that said commission organize immediately upon its appointment by electing one of its number chairman and another secretary.

Resolved, further, That it shall be the duty of said commission to thoroughly and exhaustively inquire and examine into the revenue systems of the different States and of other nations, and to collate and digest the same; to particularly examine the systems of taxation of the various forms of personal property, tangible and intangible, and the property of railway and other corporations, and to report its finding to the next General Assembly, together with a simple, economical, and practical measure, which shall embody the aforesaid requirements of the Constitution and of justice.

Resolved, further, That for the purpose aforesaid, such commission be authorized to continue its investigations to such time as it shall see fit and proper.

None of these measures were adopted; but they were regarded as important steps toward a successful revenue system. Meanwhile, of the eight acts relating to revenue which were adopted, one of the most important authorized the annual assessment of real estate, in lieu of the quadrennial method which has been followed for many years. Some of the arguments in favor of this law consisted in the fact that, in some cases, assessments have been made at an unreasonably low figure, which, under the four-year system, were perpetuated to the injury of other sections of the State; the fact that in some cases there has been rapid appreciation in the value of real estate, etc. Another important measure empowered the authorities of certain cities, villages, and incorporated towns to increase the tax to be levied for corporate purposes, including the erection of school-houses and the maintenance of schools, payment of interest on indebtedness, etc.

The following is the apportionment of the State into districts for the election of a member of Congress from each one:

First—Townships of Bloom, Bremen, Calumet, Le-mont, Lyons, Orland, Palos, Rich, Thornton, Worth, Hyde Park, and Lake, in Cook County, and the Third, Fourth and Fifth Wards of Chicago.

Second—County of Du Page, and the townships of Leyden, Cicero, Riverside, and Proviso, in Cook County, and Second, Sixth, Seventh and Twelfth Wards, and that part of the Eighth Ward south of the center line of Taylor Street, in Chicago.

Third—First, Ninth, Tenth, Eleventh, Thirteenth, and Fourteenth Wards, except that part of the latter north of the center line of Division Street and east of the following, viz.: The center line of Ashland Avenue from Division Street north to the center line of Clybourne Place, thence northeast along said line to the center line of Elston Avenue, thence northwesterly along said line to the city limits.

Fourth—County of Lake, townships of Barrington, Elk Grove, Evanston, Hanover, Jefferson, Lake View, Niles, Maine, New Trier, Northfield, Norwood Park, Palatine, Schaumburg, Wheeling, and North Chicago, and that part of the Fourteenth Ward in Chicago which is north of the center line of Division Street, and east of the following line, to wit: The center line of Ashland Avenue from Division Street north to the center line of Clybourne Place, thence northeast along said line to the center line of Elston Avenue, thence northwesterly along said line to the city limits.

Fifth—McHenry, Boone, Winnebago, Stephenson, and Ogle. Population, 123,944; Republican majority, 8,119.

Sixth—Jo Daviess, Carroll, Whitesides, Lee, and Henry. Population, 139,510; Republican majority, 5,645.

Seventh—Kane, De Kalb, Kendall, Grundy, and Will. Population, 128,955; Republican majority, 8,119.

Eighth—Kankakee, Iroquois, Livingston, Ford, Woodford, and Tazewell. Population, 162,282; Republican majority, 2,002.

Ninth—La Salle, Bureau, Putnam, and Marshall. Population, 124,200; Republican majority, 1,029.

Tenth—Rock Island, Mercer, Henderson, Warren, Hancock, and McDonough. Population, 154,846. Republican majority, 665.

Eleventh—Peoria, Stark, Knox, and Fulton. Population, 146,237. Republican majority, 1,031.

Twelfth—Adams, Schuyler, Brown, Pike, Scott, Greene, and Calhoun. Population, 163,432; Democratic majority, 3,216.

Thirteenth—McLean, Logan, De Witt, Macon, and

Piatt. Population, 143,424; Republican majority, 2,031.

Fourteenth—Champaign, Vermilion, Douglas, Edgar, Coles, and Cumberland. Population, 164,647; Republican majority, 1,827.

Fifteenth—Mason, Cass, Menard, Morgan, Sangamon, and Christian. Population, 156,419; Democratic majority, 1,366.

Sixteenth—Macoupin, Jersey, Moultrie, Montgomery, Shelby, Fayette, and Effingham. Population, 167,491; Democratic majority, 2,068.

Seventeenth—Clark, Jasper, Crawford, Clay, Richland, Lawrence, Wayne, Edwards, and Wabash. Population, 137,970; Democratic majority, 449.

Eighteenth—Clinton, Marion, Jefferson, Franklin, Hamilton, White, Saline, Gallatin, and Hardin. Population, 153,851; Democratic majority, 1,502.

Nineteenth—Madison, Bond, St. Clair, Monroe, and Washington. Population, 161,663; Republican majority, 65.

Twentieth—Randolph, Perry, Jackson, Williamson, Union, Johnson, Pope, Alexander, Pulaski, and Massac. Population, 162,727; Republican majority, 886.

All the outstanding bonds of the State were called in for redemption by the Governor, and holders were notified that interest would cease on the 1st of January, 1882. They amounted to \$250,000, and the money was in the Treasury to pay them. This extinguishes the debt of the State.

An appropriation was made by the Legislature, at its previous session, for an investigation of the food of birds and fishes, to be made at the State Laboratory of Natural History by the director, Professor S. A. Forbes. The results obtained were made public in a bulletin containing six papers, which form a connected series, constituting, practically, the first installment of a report on a natural history survey of the State, made with principal reference to its economical interests. This is the first serious and accurate study of the subject attempted in this country. It interests alike the entomologist, the ornithologist, and the husbandman. The first of the series of papers lays the foundation for the discussion of the facts obtained. Then follows an elaborate paper on the food of the spiny-finned fishes (the darters, perch, pike, bass, sunfish, and sheepshead), giving, as the result of a careful microscopic study of 425 stomachs, an account of the food of the various species in different parts of the State and at different times of the year, and at all ages of the individual. The paper is one of importance to practical fish-culture and to zoological science.

Next comes a similar study of the food of the young of all orders of fishes, demonstrating the fact that nearly all young fishes, however varied the food of the adult may be, live upon substantially the same material, i. e., the minute crustacea found most abundantly in stagnant water.

A report is then given of an investigation of the food of some of the most important birds, viz., the robin, catbird, and the other thrushes, and the bluebird. The study of the contents of the stomachs of 423 birds afforded the facts upon which the principal statements of this paper are based. Definite conclusions are

reached respecting the value of these birds to the farmer and the gardener.

Finally, growing out of the work on the food of birds, are two papers on the food of predaceous beetles, showing that many species which have hitherto been regarded as strictly insectivorous, really depend to a very great extent upon vegetable structures.

The State has an Industrial University, from which about 1,500 students have graduated during its existence. They have gone into practical avocations as farmers, machinists, chemists, railway-builders, teachers, etc. An art-gallery in the Capitol of the State contains illustrations of the various kinds of instruction imparted to the students. The results presented as the fruits of the carpenter's and machine shops have been thus described :

One follows the beginner, step by step, as he first planes out a simple squared bit of wood, a lesson which proves a most serious one, before the accurate demands of the inexorable instructor are satisfied. Then the squared piece is dressed into octagonal and cylindric forms, the latter as smooth and as truly rounded, answering the tests of sight and touch, as if turned in the lathe. Then follows a series of joints, mortises and tenons in many forms, dados, dovetails, miters, hopper-joints, and splices, all accurately fitted, not forced nor stuffed with glue, sawdust or "dutchmen," but truly joined, wood and wood, in workman's fashion. This series contains twenty-five lessons and shows the results of two hours' work per day for a term of fourteen weeks. Advanced work follows; turning, molding, with elegant specimens of veneered and inlaid work. This school shows also a series of models of structures built to scale. The one year's builder's course is illustrated by a frame of a barn, every brace, mortise, and pin accurately shown, the timbers evidently so placed as to do the most good. Two models of stairways are presented, one a regular "flier and winder," the other having an elliptical well, both furnished with hand-rails, newels, and balusters complete.

The circuit of the architectural work leads to the work of the machine-shop. Here the student begins in the pattern-shop—first upon simple forms, afterward on others more intricate. Then he works at the wood-lathe. Blacksmith's work follows; upsetting, drawing, bending, shaping, etc.; then at the vise, with cold-chisel and file; then turning with hand-tools at the small lathe; with machine-tools at the engine-lathe; drilling and counter-boring; and finding true surfaces with the planer. In both these series of elementary work no value whatever attaches to the pieces when finished. If not wanted as a sample, it goes to the kindling-wood or the scrap-pile. Often illustrating the doctrine of the "survival of the fittest," it is to the workman only a silent memento of many others, spoiled and discarded by accident, want of skill, or inattention. Other space in this case is occupied by working models of mechanical movements in iron and brass, made in the shop by advanced pupils. During the last few terms, the higher classes of this school have been occupied in the construction of a large and powerful drilling-machine.

Unusual interest has been awakened in a portion of the State relative to the construction of a canal from Davenport, on the Mississippi River, to Hennepin, on the Illinois River. This would open a line of water communication between Lake Michigan and the Mississippi River. The opening of what has been termed "the Mississippi barge route" from St. Louis

to the sea, for the transportation of grain to New Orleans, was the basis of the excitement. The immense quantities of grain transported by these large barges threatened very seriously the interests of Chicago, and foreboded a commercial revolution. With a continuous line of water route to the sea-board *via* the lakes, the St. Lawrence River, and the Erie Canal, Chicago got early control of the grain-shipping business of the West, and left to St. Louis only such share of the trade as the latter could contrive to secure by reduced railroad tariffs in summer or by the equality enforced by the frosts of winter, when such grain as was moved to the sea-board by rail might come as well from the one as from the other of the competing cities. Chicago, however, had the lion's share of the business the year round, such is the pertinacity with which trade will flow in channels to which it has become accustomed. But a revolution was impending. With the cost of barge transportation from St. Louis to New Orleans only five or six cents a bushel, and with vessels at the latter place ready to take wheat to Liverpool for twenty cents a bushel, St. Louis seemed to have grasped at last the scepter of the grain-trade.

Conventions were held in various places to give expression to the views of those whose interests were affected. At one held at Davenport, on May 26th, the following, among many other resolutions, were adopted :

This convention, representing the people of the Mississippi Valley and the Northwest, in pursuance of the call for a convention, and in furtherance of the purposes thereof, unanimously declare :

1. That Congress should devise by law, and sustain by liberal and efficient appropriations, a system of cheap transportation by water route, connecting the Mississippi River and its tributaries with the Eastern Atlantic sea-board and Gulf of Mexico.

2. That it has been the policy of Congress and the desire of the people of the Northwest for many years, to inaugurate and complete a system of water-channel improvement, having the Mississippi for its base. To give greater efficiency to this policy, there should be constructed from the Mississippi River, on the most direct and feasible route to the Illinois River, at Hennepin, and thence to the lake at Chicago, a canal adequate to the present and future transportation needs of the great part of the Northwest to whose people such work of internal improvements is an imperative necessity for relief from expensive freight rates on the produce and commerce of the country, and that the work so long needed should be immediately commenced.

3. That the continued improvement of the Mississippi River under the auspices of the Mississippi River Commission, created by act of Congress, is a work of great importance, and Congress ought to promote the scheme of improvement by the most liberal appropriations, in a separate appropriation bill therefor; and we emphasize and enforce the united and earnest demand of the people of the entire Mississippi Valley that Congress shall make prompt and adequate appropriations for the improvement of the river and its navigable tributaries, from the falls of St. Anthony to the Gulf of Mexico, and that this convention has no sympathy with any policy that would depreciate or hinder this great enterprise of making fully navigable, and of building up the great commerce upon this central river, Nature's great highway of the continent.

During the year there was a decline in the quantity of breadstuffs received in the city of Chicago equal to 27,000,000 bushels, but the value of the receipts during 1881 far exceeded that of the larger quantity received in 1880. There were nearly 20,000,000 bushels of corn and 8,000,000 bushels of wheat less received in 1881 than in 1880, but the increase of wheat, in the form of flour, about equaled the decline in the receipts of wheat in the usual form. The increase in the flour-trade is represented by 1,741,611 barrels more than was received in 1880. Five hundred and thirty-nine thousand barrels of flour were consumed in the city during the year.

The causes for the falling off in the receipts of corn were that the corn-crop was largely a failure. The following is a summary of the receipts and shipments of breadstuffs, farm products, provisions, live-stock, coal, lumber, and salt, during the year, as contrasted with the receipts and shipments of the same articles in 1880. In the totals of breadstuffs the barrels of flour are reduced to bushels of wheat:

GRAIN, ETC.	RECEIPTS.		SHIPMENTS.	
	1881.	1880.	1881.	1880.
Flour, barrels.	4,957,000	8,215,889	4,654,000	2,862,787
Wheat, bushels	15,122,000	23,541,607	17,458,000	22,796,288
Corn, bushels.	78,942,000	97,272,844	74,284,400	93,572,934
Oats, bushels.	25,007,000	23,490,915	23,225,000	20,640,427
Rye, bushels.	1,463,000	1,869,218	1,179,000	1,365,165
Barley, bushels	6,582,000	5,211,586	8,081,000	8,110,985
Totals, bush.	143,825,630	165,855,370	140,200,400	154,877,115
Beef, packages.	2,100	6,282	111,800	117,208
Pork, barrels.	52,509	39,091	817,400	367,324
Meats, tons.	69,650	82,219	393,450	479,018
Lard, tons.	30,855	34,194	136,570	166,770
Tallow, tons.	10,830	9,290	10,835	13,217
Dress, hogs, No.	53,700	89,102	86,800	38,194
Live hogs, No.	6,470,900	7,059,355	1,255,460	1,394,990
Cattle, No.	1,946,530	1,882,477	976,430	836,014
Sheep, No.	493,520	855,510	249,080	156,510
Horses, No.	12,800	10,373	10,300	8,713
Seeds, tons.	135,960	122,065	121,750	97,508
B. corn, tons.	10,400	6,312	75,000	5,630
Butter, tons.	83,005	83,662	28,300	29,935
Hides, tons.	87,300	86,562	40,520	38,150
Liquors, barrels	4,500	129,473	5,150	213,582
Wool, tons.	97,200	20,098	24,700	19,269
Potatoes, bush.	2,294,000	951,258	873,000	197,794
Coal, tons.	3,444,100	2,706,058	656,000	621,996
Hay, tons.	56,700	46,739	12,860	15,446
Lumber, M.	1,853,040	1,561,779	1,911,785	925,632
Shingles, M.	785,430	649,547	883,700	134,875
Salt, barrels.	1,169,430	1,707,446	950,650	1,062,028
Lead, tons.	28,000	15,000	13,000	17,500
Poultry, tons.	8,000	5,700		
Eggs, packages	160,000	155,000		
Cheese, tons.	24,000	21,582		
Apples, barrels.	705,000	490,000		
Beans, bushels.	178,000	118,193		

The general result may be thus stated:

Weight of farm produce, tons.	6,215,000
Weight of farm produce, tons, in 1880	6,635,000
Decrease, tons (6½ per cent)	420,000
Value of farm produce.	\$377,000,000
Value of farm produce in 1880.	312,000,000
Increase (21 per cent)	\$65,000,000
Wholesale sales.	\$423,000,000
Wholesale sales in 1880.	888,500,000
Increase (5½ per cent)	\$34,500,000

Manufacturers' products.	\$309,000,000
Manufacturers' products in 1880.	255,000,000
Increase.	\$24,000,000

RECAPITULATION.

Farm products.	\$377,000,000
Wholesale sales.	423,000,000
Manufacturers' sales.	309,000,000
Total.	\$1,109,000,000
Deduct for duplications.	94,000,000
Grand net total of trade.	\$1,015,000,000
Same in 1880.	900,000,000
Increase (12·8 per cent)	\$115,000,000

Another indication of the great increase in the business transactions during the year is shown in the Clearing-House returns, which were as follows:

Clearing-House, 1881.	\$2,250,000,000
Clearing-House, 1880.	1,725,000,000
Increase in 1881.	\$525,000,000

The following is a statement of the equalized value of lands, lots, and personal property (other than railroad) in the State for the year 1881. It is prepared from the reports of the State Board of Equalization:

COUNTIES.	Amount.	COUNTIES.	Amount.
Adams.	\$16,056,187	Lee.	\$8,066,133
Alexander.	1,722,464	Livingston.	10,387,083
Bond.	2,865,493	Logan.	8,654,040
Boone.	4,250,945	Macon.	9,062,468
Brown.	2,572,567	McDonough.	8,419,622
Bureau.	10,646,724	McHenry.	7,101,515
Calhoun.	958,617	McLean.	18,638,006
Carroll.	4,704,090	Macoupin.	10,516,749
Cass.	13,794,375	Madison.	13,298,426
Champaign.	11,294,888	Marion.	8,786,570
Christian.	8,553,918	Marshall.	4,597,044
Clark.	2,743,264	Mason.	4,394,180
Clay.	2,520,810	Massac.	1,064,376
Clinton.	3,875,262	Menard.	8,547,930
Coles.	5,565,610	Mercer.	6,350,405
Cook.	148,934,940	Monroe.	2,634,580
Crawford.	2,169,426	Montgomery.	7,945,755
Cumberland.	1,659,681	Morgan.	8,427,005
De Kalb.	8,636,990	Moultrie.	8,408,567
De Witt.	4,752,022	Ogle.	9,502,010
Douglas.	4,608,454	Peoria.	19,001,232
Du Page.	5,988,445	Perry.	1,970,537

IMMIGRATION. The immigration to the United States during 1880 and 1881 surpassed that of any previous years in the history of the country. The whole number of arrivals of immigrants during the five months ending November 30, 1881, was 291,318, and the whole number for the year ending June 30, 1881 (including six months of 1880), was 669,431. The whole number registered as arriving at American ports, during the year 1880, was 593,703, the largest number ever recorded in a single year. The only previous year in which the number of immigrants exceeded 500,000 was 1873, when 522,545 arrivals were recorded. The number of immigrants then fell off till 1877, when it was only 130,526—the lowest since 1862—but rose to 153,207 in 1878, and to 250,565 in 1879; and, as the figures already given show, more than doubled upon this in 1880. The arrivals at the single port of New York during 1880 amounted to 327,871, or an average of nearly 900 a day. Only two previous years are recorded in which the number of arrivals at this port exceeded 300,000, viz.: 1852, 300,992; and 1854, 319,223. While in the two years last named the larger proportion of the arrivals was from Ireland, the preponderance of emigration in 1880 was from the Continent, particularly from Germany and the Scandinavian countries. The immigrants arriving at New York during 1880 are classified according to their nativity as follows: from Ireland, 66,399; from Germany (including a few from Austria), 108,725; from the Scandinavian kingdoms, 50,731; from Eng-

land, 33,768; from Scotland, 9,625; from Wales, 3,588; from Hungary, 6,672; from Holland and Belgium, 4,568; from Switzerland, 8,223; from France, 4,087; from Italy, 11,190; from Bohemia, 7,606; from Russia (mostly Mennonites and of German origin), 7,693; from Spain and Portugal, 985; from Luxembourg, 511; Turks, 61; Greeks, 40; from the West Indies, 1,298; from Mexico and Central America, 221; from South America, 355; from British North America, 588; from Australia, 39; from Africa, 45; from Asia, 262 (of whom 200 were Chinese). The destination of 287,729 immigrants, or nearly 90 per cent of the whole number that landed at the port, is given as follows:

New York continues to be the most important port of arrival for immigrants. Between 1847 and 1880 it received 6,184,396, or more than 80 per cent of all who came to the country. The arrivals at the several ports from 1871 to 1880, inclusive, were as follows: *Atlantic coast ports*: New York, 1,712,331; Boston, 198,259; Baltimore, 94,453; Philadelphia, 66,436; Passamaquoddy, Maine, 34,861; Portland, 20,620; twelve other ports north of Cape Henry, 1,547; total for the Atlantic ports north of Cape Henry, 2,743,432. *Gulf ports*: New Orleans, 33,953; Key West, 9,655; Galveston, 3,475; total for all ports from Cape Henry to the Rio Grande, 49,901. *Lake ports*: Fifteen lake ports, from Champlain to Duluth, 485,025. The most important of the lake ports, and the second most important port for immigration in the country, is Huron, Michigan, which received in ten years 437,063 British Americans (including, perhaps, a few thousands who came from Europe by way of the St. Lawrence) seeking homes in the Northwestern States. *Pacific ports*: San Francisco, 133,932 (122,436 of whom were from China); ports of Oregon, 11,339; Alaska, 113; total Pacific ports, 2,812,177. Whole number of arrivals during the ten years 1871-1880, 2,812,177. Of these, 436,871 were from Ireland and 781,191 from Germany.

A marked feature in the immigration of recent years is the current from the British North American provinces, which has reached such proportions as to have attracted the serious attention of the authorities of the Dominion. The number of arrivals in 1880 was 112,712 from the Dominion of Canada and 139,761 from all the British Provinces, and 881,000 persons are shown by the records to have come to the United States from British-American provinces since 1820, besides whom many thousands must have come over the border without being recorded. The immigration from Russia is made up to a considerable extent of Mennonites from the Crimea and other southern parts of the empire, who, having removed from the German states in obedience to their principles of non-resistance to escape compulsory military service, and under the inducement of an offer of special privileges if they would settle in Russia, are now removing thence on account of the withdrawal of those privileges. Jewish immigrants are beginning to arrive from Russia in considerable numbers, having been driven

away by the persecutions and indignities that have been inflicted upon them during the past year. Fifteen hundred of these people had arrived at the end of December, 1881. They receive care and attention from their co-religionists in Europe and America through their regularly organized societies. The immigrants are stated, by an American committee appointed for their care, to comprise men of all professions, trades, and pursuits, with their families, and to be largely composed of people likely, in the end, to prove valuable to the country. An immigrant aid society has been formed in the city of New York for the purpose of providing for the wants of the immigrants as they arrive and of directing them to suitable places of residence, and has appointed agents to visit Europe and raise among the Jews there—who are represented as ready to contribute—funds for establishing colonies. The immigrants who have already arrived have been dispatched to points in the West and Southwest, and an agricultural colony has been established on Sicily Island, Catahoula Parish, Louisiana.

The Chinese come chiefly to the Pacific slope, and for the most part through the port of San Francisco. Consequently, it is in the Pacific States alone that the Chinese have become so numerous as to attract special attention. In five of these States their number has increased in ten years as follows: California, from 49,310 in 1870 to 75,025 in 1880; Oregon, from 3,330 in 1870 to 9,506 in 1880; Nevada, from 3,152 in 1870 to 5,420 in 1880; Washington, from 234 in 1870 to 3,182 in 1880; and Arizona, from 20 in 1870 to 1,632 in 1880; and it has decreased in Montana from 1,949 in 1870 to 1,737 in 1880, and in Idaho from 4,274 in 1870 to 3,378 in 1880. The whole number of Chinese in the United States increased from 63,254 in 1870 to 105,679 in 1880.

The following table shows the whole number of immigrants that arrived in the United States between 1783 and 1880.

IMMIGRANTS FROM 1783 TO 1880.

Chief nationalities.	Number.
England.....	953,593
Ireland.....	8,137,364
Scotland.....	172,187
Wales.....	19,066

Pacific islands and not specified.....	73,230
Grand total.....	10,616,056

To these might be added many thousand persons who come to the United States from Canada and Mexico, of whom no record is made; and these, with those who arrived during 1881, would swell the whole number to between eleven and twelve millions.

The Commissioners of Emigration of the Port of New York have established a complete system of rules for the care of immigrants arriving there. Spacious quarters for their reception and temporary accommodation are provided at Castle Garden. When a passenger steamer arrives from a foreign port, a boarding officer visits her, examines into the sanitary condition of the vessel and passengers, hears complaints, ascertains if proper care has been taken of the passengers during the voyage, and makes his report to the Superintendent at Castle Garden. The landing agent, while the passengers are still on board, gives checks for the baggage of immigrants, and it is taken to the Garden, where it is insured against fire and other damage, and remains until it is claimed by its owners. Many of the immigrants of later years have been of the middling and well-to-do classes, and fully three fourths of them have come provided with prepaid tickets to their places of destination in distant States. These need but little attention, except for the examination as to their health, and to see that they are directed aright. Each person on landing at Castle Garden undergoes a medical examination, when, if he proves to be permanently diseased, blind, crippled, lunatic, or a pauper, the ship-owners are obliged to give bonds to insure the State against expense on his account or take him back. If he is ill, he is given medical treatment or sent to a hospital. To save the immigrants the trouble and perils of wandering about in a strange city, a restaurant, cooking-stoves, and wash-rooms, are provided for them; authorized brokers are appointed to make exchanges for them and cash their notes and drafts, at the ruling rates of the day in Wall Street; a telegraph-office and a post-office are furnished, and each person is asked if he expects to receive or wishes to forward correspondence; the principal railroads are allowed to have ticket-offices in the Garden; a baggage express delivers city baggage at low rates; and the Custom-House has a bureau in the Garden to facilitate the clearance of the baggage of immigrants. Food and lodging are temporarily supplied to the destitute, and every kind of physical suffering is provided for at the hospitals, to which the immigrants have access. A Bureau of Information in 1880 enabled 26,612 persons to communicate with resident friends without trouble

or expense. A number of licensed boarding-house keepers, who are admitted under careful regulations, sheltered 46,612 persons at prices approved by the Commissioners. The Labor Bureau, under the direction of the Irish and German Employment Societies, provided places for 28,806 men and boys and 10,505 women and girls. Several of the religious denominations have agencies at Castle Garden, where assistance is given to persons of their faith, and others who may apply.

INABILITY OR DISABILITY OF THE PRESIDENT. The long illness of President Garfield, after the assassin's shot, on the 2d of July, to his death, on the 19th of September, gave rise, for the first time in the history of the American Republic, to a discussion of the scope and meaning of the constitutional provision for the devolution of the powers and duties of the executive office upon the Vice-President, in case of the inability of the President to discharge the same. As no official action was taken involving a determination of the question, the discussion was confined chiefly to the public journals and to informal expressions of opinion by public men. The Constitution of the United States provides that, "in case of the removal of the President from office, his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President; and the Congress may, by law, provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President; and such officer shall act accordingly until the disability be removed or a President shall be elected." Among the incidental points discussed were the meaning of the phrases "devolve upon the Vice-President," and "act as President," and the possible difference between "inability" and "disability." In the latter clause of the section quoted, the term "inability" is obviously intended to cover elliptically the meaning of the preceding phrase, "inability to discharge the powers and duties of the said office," and "disability" appears to have the same meaning, inasmuch as the other causes for providing for the discharge of executive duties are such as would produce an actual vacancy in the office, and could not be "removed." The use of the term "disability" is also to be noted in the twelfth amendment of the Constitution, in which it is provided that, in case no President has been elected by the end of the term of an actual incumbent, "the Vice-President shall *act as President*, as in the case of the death or other constitutional *disability* of the President." This provision of the amendment, which was adopted in 1804, while many of the original framers of the Constitution were still in public life, seems also to indicate that they made no distinction between the Vice-President *acting as President* and having the powers and duties of the executive office *devolve* upon him.

The question has never been authoritatively settled whether the Vice-President was intended to become President, or only to "act as President," retaining his former title even when an actual vacancy takes place. The first case occurred on the death of Mr. Harrison in 1841, when the question arose in Congress whether, in appointing a committee to inform Mr. Tyler of the organization of the two Houses, that officer should be styled the "President" or the "Vice-President now exercising the office of President." Mr. Wise, of Virginia, stated that "he knew the fact that the present incumbent would claim the position that he was by the Constitution, by election, and by the act of God, President of the United States." Little consideration was given to the question involved, and Congress simply decided to give the title of President to the person exercising the duties of the office, in its communications with him, Mr. Calhoun taking occasion to remark that as none of the circumstances existed which might arise in the case of inability, "there could be no special occasion for discussing the subject." This precedent can hardly be said to have settled any constitutional principle, or definitely determined that the Vice-President becomes President, when the executive office falls vacant by the death of the incumbent; but it established the practice of calling him the President, which has since been followed by Congress and by the country. There has never been any case of removal or resignation, and, as already intimated, no question of the meaning or effect of "inability" had ever arisen previous to the shooting of General Garfield. The question then was, whether a temporary incapacity of the President for performing the functions of his office created such an exigency as was contemplated by the Constitution, and whether it would be proper for the Vice-President to assume their performance. If such was the case, what power was to determine what constituted inability and when it existed? By what process was that determination to be made? If constitutional inability was established, would the Vice-President then become President, or act as President for the remainder of the term, or would he act only temporarily, while the inability continued? If the latter, how was it to be determined that the inability was at an end, and by what process was the Vice-President to be called to the performance of executive duties, and again relegated to his former place and functions? None of these questions were explicitly answered by the Constitution, and none of them had ever been dealt with by the national judiciary or Legislature. It was even a question whether Congress had any power to legislate on the subject. It was claimed, on the one hand, that it had no such power, inasmuch as it was not actually conferred by the section of the Constitution relating to the succession. It was even contended by some that the grant of power to act,

in case of the "inability" of both President and Vice-President, must be taken as indicating that no corresponding power could be exercised in case of the "inability" of the President alone, in regard to which no such grant was made. On the other hand, it was maintained that the general grant of authority to make the laws necessary to execute all powers provided for in the Constitution was sufficient to cover the case.

As no imperative necessity arose for the exercise of executive duties during President Garfield's illness, and as no action was taken for the determination of the questions raised, it will only be possible to quote some of the more important opinions that were made public in the course of the discussion. The Hon. R. W. Thompson, of Indiana, gave it as his opinion that in case of mental incompetency the fact could be established by judicial inquiry, and on proper notification the Vice-President would act temporarily or permanently as the occasion might require. In the case of physical inability the President himself would be competent to decide as to the necessity, and could cause the Vice-President to be notified, when it would be his duty to perform such executive acts as were called for until the President was in a condition to resume the discharge of his duties. The Hon. Thomas A. Hendricks gave it as his opinion that Congress had no power to define presidential disability, but, if the fact were established beyond doubt by force of circumstances, it would be entirely proper for the Cabinet to notify the Vice-President, whereupon he would assume the performance of executive duties while the inability of the President continued. The Hon. Lyman Trumbull, of Illinois, in a carefully prepared paper, took the ground that in no case did the Vice-President become President, but in certain defined exigencies he was "to act as President" or "exercise the office of President." The practice of conceding the title in case of a vacancy settled no constitutional principle. In his view no distinction existed between the position of the Vice-President when a vacancy had been caused and when inability existed, and, if in the latter case he became President, then there would be two Presidents. Inability might be temporary, in which case the Vice-President would act only while it lasted. Mr. Trumbull expressed the opinion that there was no tribunal that could determine the question of inability, and no occasion for any. He did not favor any legislation on the subject. It was his belief that the existence of the fact should be beyond question and generally admitted as a matter of public notoriety, as in case of the death of the President, and then there would be no difficulty. The Vice-President would assume the performance of all necessary executive acts without objection, and would cease to do so when the necessity ceased to exist. "It is questionable," he said, "whether any law can be framed placing

this question of inability in a better position than the Constitution has left it. The degree of proof to satisfy the public mind can not be previously defined. Every citizen of the republic constitutes a part of the law-making power. Hence the respect of all for the law, and their readiness at all times to uphold and defend it. They take notice of public matters affecting the government of the country, of who is President, of his death or inability, and of the accession of another to the duties of President. When this accession follows the notorious and unquestioned inability of the President, they will be as ready to uphold the Vice-President in the discharge of the duties of the presidential office as if he had been elected to it. Any Vice-President who should assume those duties in a doubtful case, when the exigency did not unmistakably require it, would be treated as a usurper by all patriotic citizens. Peaceful successions to the presidency, under our system of government, must always depend on a sound public opinion, supported by the good sense and the intelligence of the people; and there it may be safest to leave them."

Judge T. M. Cooley, of the University of Michigan, a well-known writer on constitutional law, took a somewhat different view of the subject. He agreed that the inability should not be of a doubtful or transitory character, but such as made it imperatively necessary that some one should act in place of the President. He had no doubt that it might be of limited duration, and that in such case the action of the substitute should cease when the necessity for it was at an end; but he was of opinion that there should be some authoritative tribunal to determine when the necessity existed and when it ceased to exist. In his opinion, Congress was the proper tribunal to decide upon this question, and one that had sufficient power under the Constitution to provide for any such emergency. This it could do by dealing with a particular case when it arose and called for action, or by a general law applying to all cases. After discussing the question of the general authority of Congress over the subject, he concluded: "It may be added that, while Congress could provide for such cases by general law, it could have no less power to provide by special law, and that almost inevitably every case would be peculiar and require to be dealt with specially. We conclude, therefore, that an inability, in the constitutional sense, is one that not only exists presently, but, in the opinion of Congress, is of such a nature and probable continuance that it causes or threatens inconvenience to public affairs. It is possible for a case to arise so plain, and so unmistakably determined in the public judgment, that public opinion, with unanimous concurrence, would summon the Vice-President to act. But, though this would make him acting President *de facto*, he would become acting President *de jure* only

after solemn recognition in some form by Congress."

General B. F. Butler agreed with the writers already mentioned in the opinion that presidential inability might be other than permanent in its character, and that in such case the duties of the office devolved upon the Vice-President only during its continuance; but he took the ground that it was for the Vice-President himself to determine when the exigency existed. He thought the Constitution was sufficiently explicit and its meaning sufficiently plain, and believed that there was neither authority nor necessity for legislation on the subject. He said: "It may be taken as axiomatic that when the Constitution imposes a duty on any officer, to be done by him, he must be the sole judge when and how to do that duty, subject only to his responsibility to the people, and to the risk of impeachment if he act improperly or corruptly. As we have seen, the Constitution devolves, in a certain case, the discharge of the duties of the President upon the Vice-President. He alone must judge, under the grave responsibility of his position, when his duties begin, as he must determine how and in what manner he will execute them." In answer to the objection that the Vice-President might be tempted to seize upon the power of the executive office without sufficient warrant, Mr. Butler said: "The fear of danger implied in this proposition arises from another error into which some who have discussed the question have fallen, and that is that the Vice-President can not discharge the duties of the presidential office without becoming President, for which proposition there certainly is no constitutional authority." After discussing the constitutional provisions applicable to the case, he continued: "This interpretation ought to allay the fears of all good people as to the temptation of a Vice-President, in a doubtful case, to insist upon the discharge of the duties of the President. A case can hardly be imagined of inability which would not be temporary, and the Vice-President would have no temptation to thrust himself into the discharge of the duties of the office of President, wherein he could do nothing by possibility that would be permanent, and without surety that his powers to discharge those duties would last a single day. He might nominate a few officers, but if he had thrust himself into the discharge of the presidential duties wrongfully, the Senate would never confirm his nominations. He might approve laws, but the Houses of Congress will never send any acts to a Vice-President for approval who should decide the question of the inability of the President in a manner to shock the sense of the people."

Professor Theodore W. Dwight, of the Columbia Law School, in New York city, took quite a different view of the subject from that of any of these writers. He maintained that "inability" and "disability" are equivalent expressions, having a technical meaning in consti-

tutional law, to be determined by the ordinary rules of interpretation. This meaning he held to be a mental incapacity for the discharge of official duties. This must be determined by a proper judicial proceeding upon competent evidence. If the fact of inability is established, Professor Dwight holds that the effect must be to devolve the office of President upon the Vice-President, to be exercised by him until the end of the term. The President is as completely displaced as if he had died, or resigned, or been removed from office. His conclusions are summed up as follows: "The 'inability' of the Constitution is strict intellectual incapacity. This condition of mind must be established by evidence under forms of law, which Congress is competent to prescribe. When such inability is properly established in the case of the President, his office devolves upon the Vice-President, who thereupon becomes President, retaining the office until the end of the four years' term, unless a constitutional disability occurs in his case."

Another question that arose as the result of President Garfield's illness related to the order of succession in case of the disability of both President and Vice-President. The Constitution distinctly left it for Congress to provide for such an emergency, and an act was passed, which became law on the 1st of March, 1792, declaring that in such case "the President of the Senate *pro tempore*, or, if there is none, then the Speaker of the House of Representatives for the time being, shall act as President until the disability is removed or a President elected." In the revision of the statutes, the phrase "*pro tempore*" has been omitted. It has been a general custom in the Senate, before the end of a session, for the Vice-President to retire from the chair, in order that a President *pro tempore* may be chosen; but this was not done by Mr. Arthur at the special session which adjourned in May. Hence, no such officer existed during the illness or at the time of the death of General Garfield. As the Forty-sixth Congress expired on the 4th of March, and the first regular session of the Forty-seventh did not begin until December, there had been no organization of the House of Representatives, and there was no Speaker. This state of things naturally brought up the question of the propriety of the legislation of 1792, which had never before attracted special attention. It was contended that the line of succession to the Executive chair should not fall to "officers" who might have no existence for months together. Serious objection was also raised to placing the presiding officers of the legislative department of the government in that line. More than that, it was claimed that they were not officers of the government within the meaning of the Constitution. When in 1798 an attempt was made to impeach Senator Blount, of Tennessee, it was decided that a Senator was not an officer of the United States subject to impeachment. As "all civil officers

of the United States" are subject to that process, it has always been understood that this decision established the principle that Senators, and, by parity of reasoning, members of the House of Representatives, are not officers of the United States. If such is the case, it is said, choosing any one of them to preside over the deliberations of the body of which he is a member does not make him such an officer. Hence the argument that the law of 1792 is unconstitutional, as well as inexpedient. It is worthy of note that that law was passed with difficulty and by a close vote, the same objections being made at the time. The rival proposition that the Secretary of State be designated as the officer to act as President in case of the disability or removal of both President and Vice-President, is reputed to have been defeated for political reasons, Mr. Jefferson being at that time Secretary of State.

President Arthur, in his first annual message, called attention to the questions which had arisen in regard to presidential inability or disability, and commended them to the "early and thoughtful consideration" of Congress. The subject was promptly taken up in the Senate, the following resolution being offered by Mr. Beck, of Kentucky, on the second day of the session:

Whereas, The Constitution of the United States provides that, in case of the removal of the President from office, or of his death, resignation, or inability to discharge the duties of the said office, the same shall devolve on the Vice-President, and that Congress may by law provide for the case of removal, death, resignation or inability, both of the President and Vice-President, declaring what officer shall act then as President, and such officer shall act accordingly until the disability be removed, or a President shall be elected. And, whereas, it greatly concerns the peace of the country, and perhaps the very existence of the government, that the laws enacted by Congress in pursuance of that provision of the Constitution should be so comprehensive as to provide for every vacancy that can possibly occur in the office of President, and so clear as to admit of no controversy nor any question of disputed succession to that high office: To the end, therefore, that all doubts or defects which may exist in our present laws on this subject may be remedied and future controversy prevented, be it

Resolved by the Senate, That the Committee on the Judiciary be instructed to examine into said provisions of the Constitution and into the laws passed by Congress to carry them into effect, and inquire whether the provisions of said laws are constitutional, proper, and adequate in all respects to their purpose and end, or whether any further legislation be necessary or proper, and to report thereon by bill or otherwise.

A resolution of similar import was presented by Mr. Maxey, of Texas, and the following bill was introduced by Mr. Garland, of Arkansas:

Be it enacted, etc., That section 146, Title III, of the Revised Statutes is hereby repealed.

SECTION 2. In case of the removal, death, resignation, or inability of both the President and Vice-President of the United States, the Secretary of State for the time being, or, if there be no Secretary of State, then the Secretary of the Treasury for the time being, or, if there be neither Secretary of State nor Secretary of the Treasury, then the Secretary of War for the time being, shall act as President until the disability be removed or a President be elected in the manner and

at the time provided in the Constitution and laws, or, in case there be no occasion under the law for an election, until the existing term of office of the President so removed, resigned, dead, or disabled, shall have expired.

There was a brief debate on Mr. Beck's resolution before the holiday recess, but the general consideration of the subject went over to the part of the session belonging to the year 1882.

INDIA. A British viceroyalty in Asia. Viceroy and Governor-General of Bengal, Marquis of Ripon, appointed in 1880. Commander-in-chief of the army, General Sir D. M. Stewart. The Executive and Legislative Council is composed as follows: the Viceroy, Commander-in-chief, Whitley Stokes, Sir A. Rivers Thompson, James Gibbs, Major Ev... Baring, and Major-General T. F. Wilson. Lieutenant-governors of the provinces are honorary members of the Council, when it meets in their respective provinces. Government Secretaries: for the Interior, C. E. Bernhardt; for the Finances, R. C. Chapman; for Foreign Affairs, Sir A. E. Lyell; for Military Affairs, Colonel G. T. Chesney; for Public Works, Colonel A. Fraser; for Legislative Affairs, D. Fitzpatrick. The governors of the different provinces are as follows: Bengal, Lieutenant-Governor Sir A. Eaden; Northwestern Provinces, Lieutenant-Governor Sir G. E. W. Couper, Bart.; Punjab, Lieutenant-Governor Sir R. E. Egerton; Central Provinces, Chief Commissioner J. H. Morris; British Burmah, Chief Commissioner Sir C. N. Atchison; Madras, Governor-General Rt. Hon. M. E. Grant-Duff; Bombay, Governor-General Sir James Fergusson.

The area of British India and the population according to the census of 1871-'72 are as follows:

PRESIDENCIES AND PROVINCES.	Square miles.	Population.
Presidency of Bengal:		
Lower Bengal.....	156,200	60,502,597
Assam.....	55,384	4,162,019
Northwest Provinces.....	105,395	42,001,436
Punjab.....	104,975	17,611,498
Central Provinces.....	84,208	8,201,519
British Burmah.....	88,556	2,747,148
Ajmeer and Malwarra.....	2,711	896,889
Berar.....	17,711	2,227,654
Coorg.....	2,000	168,812
Presidency of Madras.....	188,556	81,672,618
of Bombay.....	124,102	16,349,206
Under British administration..	880,098	186,041,191
Feudatory states.....	604,590	54,211,158
Total.....	1,484,688	240,252,349

The preliminary reports on the census of 1881, as far as published, are as follows: Lower Bengal, 68,750,747; Northwest Provinces (exclusive of Oude), 32,699,436; Oude, 11,407,625; Punjab, 22,640,463; Central Provinces, 11,098,601; British Burmah, 3,704,253; Ajmeer, 455,944; Mysore, 4,186,499; Coorg, 178,283; Presidency of Bombay, 14,025,593; Sind, 2,404,934; Baroda, 2,154,469; Rajpootana, 10,881,166.

The population of the principal cities, according to the census of 1881, is as follows:

Calcutta.....	688,458	Meyroot.....	60,882
Bombay.....	753,000	Shahjehanpore.....	77,538
Madras.....	405,948	Mirzapore.....	62,495
Lucknow.....	261,481	Moradabad.....	67,158
Benares.....	207,570	Allypore.....	62,451
Agra.....	187,908	Goruckpore.....	58,569
Allahabad.....	150,378	Scharunpore.....	58,742
Cawnpore.....	119,608	Muttra.....	54,985
Bareilly.....	101,688	Maulmain.....	53,080
Rangoon.....	132,004	Hyderabad.....	263,005

The emigration of coolies in 1878 was as follows:

From Calcutta.....	18,488
" Madras.....	8,890
" French ports.....	2,804
Total.....	25,182

The destination of these coolies was as follows.

British colonies.....	19,698
French colonies.....	5,165
Dutch Guiana.....	824
Total.....	25,182

The gross receipts were estimated in the budget for 1881-'82 at £70,981,000, the ordinary expenditures at £70,126,000, and the extraordinary expenditures at £4,973,000, making the total expenditure £75,099,000.

The public debt on March 31, 1878, amounted to £146,684,770.

The closed accounts of Indian finances for the year 1879-'80 show a revenue of £68,484,666 and an expenditure of £69,667,615, leaving a deficit of £1,182,949, as against an estimated deficit of £1,355,000 in the budget estimate of the year before. The revenue exceeded the estimate by £3,922,000, and the expenditure by £3,750,000. The receipts from opium exceeded the estimate by £1,900,000, and there was also a considerable improvement in the returns from public works. The unexpected increase in expenditures was owing to war expenses and frontier railway construction in connection with the Afghan war. The extraordinary discrepancies between the estimates of the war expenditures and the actual returns were ascribed to inaudited issues of money from the local treasuries to the military department, which the negligent military accountants failed to notice.

In the budget estimates for the year 1880-'81, made the year before, the revenue was set down at £66,746,000 and the expenditures at £66,329,000, giving an estimated surplus of £417,000. The regular estimates for that year make the revenue £70,768,000 and the expenditure £77,037,000, showing a deficit of £6,269,000. This deficit was, like that of the previous year, due to war expenditures. There was an increase of no less than £1,218,000 in the opium revenue, of £309,000 in excise, and of £351,000 in customs. The land revenue showed a falling off of £295,000, which is expected to be recovered in the following year, as the officials neglected to make collections, being so occupied with the census.

The budget estimate for 1881-'82 reckons the revenue at £70,981,000 and the expenditures at £70,126,000, giving an estimated sur-

plus of £850,000. If the £3,000,000 of imperial aid were not reckoned in, the estimate would show a large deficit. The fluctuations in the opium revenue, the losses by exchange, and the uncertainty of the harvests, are three elements which render the preliminary estimates of Indian finances exceedingly unreliable. Minister Baring has estimated the opium revenue for 1881-'82 at a low figure, in order to be on the safe side, and prevent further injury to Indian credit by the disclosure of an unexpected deficit. The customs revenue he also estimates at a low rate, and calculates that the net loss by exchange will be about £3,063,000. A falling off in the opium revenue of £2,000,000 is allowed for in the estimate. An improvement of £687,000 is expected in the land revenue. The estimated surplus of 1881-'82 is obtained by including £3,000,000 of the imperial contribution to the expenses of the war, and the deficit of 1880-'81 is lessened by the amount of £2,000,000 from the same source. On the other side, the annual reserve of £1,500,000 for protection against famine is charged against the revenue in 1881-'82 for the first time. The late Parliament voted an advance of £2,000,000 to the Indian Government without interest to aid it in tiding over the financial difficulty resulting from the war. In 1881 Gladstone carried a motion in Parliament, making this loan a gift, and granting the further aid of £3,000,000, payable in annual installments of £500,000. The whole £5,000,000 have been entered in the Indian financial statements at once.

In the beginning of 1880 Sir John Strachey estimated the total cost of the Afghan war at less than £10,000,000. Every succeeding estimate swelled the amount, and when the accounts were finally closed the actual expenses of the war footed up £23,412,000. Of this, £4,465,000 is chargeable to frontier railways and military railways in the Punjab. Even with the £5,000,000 of aid from the British Treasury the Afghan war has swallowed up nearly the entire famine fund, £4,035,309 of the famine receipts having been diverted, and £9,523,574 of surplus revenue, besides taking from the cash balances, that is, adding to the public debt, the sum of £4,513,470.

The scheme of laying aside £1,500,000 annually for provision against future famines was determined upon during the incumbency of Sir John Strachey, and was one of the results of the famine investigation by a parliamentary commission. As stated above, the funds reserved for this purpose for the first four years have been applied to the war expenses. The specified sum, £1,500,000 per annum, will be reserved in the future and included in each year's expenditures. One half of the famine insurance reserve is to be employed in constructing protective works, and one half accumulates into a fund applied in the reduction of the sterling debt. The protective works, which it is proposed to construct first, are the

Niru Canal, in Bombay; a railway from Rewaree to Hansee, in the Punjab; the completion of the line from Bellary to Hospett, in Madras; a branch line from Hotgi, near Shemlapore, to Bijajore; and the Betwa Canal, in Bundelcund. The famine insurance fund has been so far dependent only on the license-tax, which diminishes as the public works become profitable. The present plan is to take the specified amount out of the general revenue each year.

Major Baring in his budget minute shows that the finances of India rest at present on a sound basis, and that the revenue considerably exceeds the expenditure, eliminating the temporary drain of the Afghan war. The prospects for the future are, however, far less satisfactory; for, while the Secretary of State's bills are gradually increasing in amount, the land-taxes, which are the main source of revenue, are stationary, and the opium revenue is precarious. The reduction of the military expenditure is considered imperative in order to guard against the period of embarrassment. By encouraging private enterprise, the Government may improve its own financial condition in promoting the general prosperity. In this direction, it is recommended that the Government should supply its wants by buying in the local markets. This was lately done in the case of harness and accoutrements for the army, and the work the native artisans turned out was neat and durable. The Government has also adopted the policy of seeking to establish commercial relations with foreign countries. Aid was granted to a syndicate which undertook to introduce Indian tea into the Australian and American markets. It is proposed to encourage jute and cotton exports to the British colonies in the same way. The encouragement of railway construction is also urged by the Finance Minister. The policy of the late Government was to have the railway system constructed and maintained by the state. The Liberal administration is desirous that the system should be completed as far as possible by private enterprise, and hopes to induce private companies to undertake the construction of new lines without the Government guarantee by grants of land and subsidies, with the right reserved to the state of acquiring them by purchase after a certain time. One company has been formed, under the auspices of the Rothschilds, to build a road from Calcutta toward Jessore and Koolna. The Government have made an arrangement with the Punjab Railway Company by which the guarantee is only four per cent, and only for the period of construction, and the railroad is to become the property of the state after a period of ninety-nine years.

The Government expended in the last three years £10,306,273 in the construction of productive public works. The total cost of the productive public works in four years was £26,853,722, and the total receipts £27,626,-

341. The total expenditure from the beginning on the different kinds of public works denominated productive is now very nearly remunerative, the net receipts for the three years past falling but £772,000 short of the full interest on the capital invested. The amount to be expended annually on such work is limited to £2,500,000, which is admitted to be inadequate to the wants of India, but which the Secretary of State for India, Lord Hartington, upholds, hoping that the wants will be supplied through private enterprise. The East Indian Railway, which has lately been acquired by the Government, is excluded from the restriction. The actual expenditures for 1881-'82 from borrowed capital are £2,608,000 on the state works and £860,000 on the East Indian Railway, besides £2,159,000 in sanctioned additions to guaranteed railways; while the disbursements from the revenue for the net losses on state and guaranteed railways were £417,000, and on the construction of works of the same character, but which are not classed as "productive," £300,000 on navigation and irrigation, £750,000 on famine-relief works, and £790,000 on frontier railways. The interest charge on guaranteed and state railways, paid out of the revenue, has diminished in ten years from £2,000,000 until the point is reached where these works promise to become a source of revenue.

A loan of three crores of rupees was subscribed for in India at an average premium of over five per cent, although the interest is only four per cent per annum. A three and a half per cent loan was also raised in London on equally favorable terms in the early part of the year.

The decentralization policy which has been adopted, since 1877 more especially, has had a good effect on the financial administration of some of the provinces, but has introduced an element of confusion into the Imperial accounts, as was seen in the Afghan war estimates. Measures are being taken to have the local finances better systematized.

The census of India was taken in February. The total population is found to be 252,541,210, of whom, approximately, 123,211,327 are males and 118,166,371 females. The increase since the last decennial census is 12,788,565. The returns for the individual provinces are as follows: Bengal, 68,829,920; Assam, 4,815,157; Madras, 30,839,181; Bombay, 14,025,593; Sindh, 2,404,934; Northwest Provinces, 33,445,111; Oude, 11,407,625; Rajpootana, 10,881,166; Punjab, 22,647,542; Central Provinces, 11,505,149; Berar, 2,670,982; Burmah, 3,707,646; Mysore, 4,186,399; Coorg, 178,283; Ajmere, 453,075; Baroda, 2,154,469; Travancore, 2,401,158; and Cochin, 600,278. The provinces showing the greatest increase are—Burmah, 35 per cent; the Central Provinces, 25 per cent; Berar, 20 per cent; and Assam, 19 per cent. The only provinces showing a decrease are those depopulated by the

famine—Bombay, 2 per cent; Mysore, 17 per cent; and Madras, 2 per cent. The corrected returns of the population of Bombay show a decrease of about 2 per cent since 1873, whereas in ordinary times it increases in about that proportion. Bengal increased 9 per cent in the ten years, but Calcutta remained almost stationary, the population of the city and suburbs being 683,329, whereas in 1876 it was 686,684.

The results of the census were looked forward to with interest for the light it would cast upon the over-population theory of famines. The last famine affected a population of 58,000,000 souls and an area of 257,000 square miles, and was unprecedented in severity, duration, and extent. The mortality in the famine-stricken districts was sufficient to cause an actual decrease in the population of all of them since 1871. There have occurred thirty-six years of scarcity and twenty famines, seven of which were intense, in the last one hundred years. The mortality from this cause is computed at 10,000,000 within thirty years, this being less, however, than the mortality from cholera and fever. The main remedies proposed against the devastations of famine are to diversify the occupations of the people, and to improve the methods of agriculture. The bringing under cultivation of waste lands and the construction of protective works are deemed of secondary importance as far as removing the causes are concerned; although the improvement of the ways of communication embraced in the scheme of famine relief is urgently needed, in order to enable the Government to deal with recurring famines by forwarding supplies to the distressed districts. The whole population of India is employed in agriculture. The stimulation of manufactures by a protective tariff has been tried with encouraging results, but this plan comes into collision at too many points with the interests of British manufacturers to be carried out. Still, though the whole protective system will probably be thrown overboard by the present Government, the era of manufacturing and mining development seems to have commenced in India. The natural resources of India are great and manifold, though the entire industry of the country is now confined to a few agricultural products, grown by the most unskillful and exhaustive methods. The supply of labor is superabundant. There is no accumulated capital in India, but British capital is now attracted to this promising field.

Only about half of the area of India is cultivated, but on the cultivated area there subsists twelve times as many people as would be necessary to keep it in the highest state of cultivation. The system of farming is so rude that an acre of cotton, for example, yields less than one fifth the quantity obtained from an acre in Egypt or the United States, and the quality is so inferior that it brings only half the price. The simplest improvements in the manner of

cultivating the soil would, if carried out over the cultivated area of India, be sufficient to provide abundant stores to support the population through all the droughts and famines, and the locust and rat plagues. New staples have been introduced in the last few years. The jute, tea, and coffee trades together already exceed \$50,000,000 annually. The syndicate which received assistance from the Government for the purpose of extending the tea market, succeeded in introducing Indian tea in America, and in increasing the exports to Australia from 86,623 to 621,128 pounds. Sugar and quinine are other new products, and tobacco, which already competes with American tobacco in Italy. Leather and forest products of various kinds are the materials for newly started trades. The mineral resources of India must soon be brought out by the aid of the railways. There have been gold discoveries within a couple of years, which have led to enormous speculation in London, but their actual value has not yet been determined.

The British rule in India is still a pure military despotism. The feeling of discontent is so deep and general that the Government would be overthrown the moment that the certainty of prompt and terrible retribution were not felt. The military forces are kept constantly on the move to suppress insurrections in all parts of the empire, which would spread like a conflagration except for the summary and relentless vengeance of the British soldiers. To maintain a military establishment sufficient to hold in subjection the whole population and support the costly civil administration by foreigners, who are allowed to reap large fortunes during a brief incumbency out of their emoluments, besides paying an annual tribute to Great Britain, requiring the remittance of \$35,000,000 annually, to meet the Secretary of State's bills, must keep India in a state of perpetual poverty. These causes explain why enormous quantities of food must be exported in years when millions of the people are dying of starvation. In the words of Lord Hartington, "India is a poor country, her people a poor people, her commerce a weak commerce." The total foreign trade is \$624,000,000, which is less than \$2.50 per head of the population, whereas the commerce of Great Britain is over \$100 per head. The Indian imports amount to about \$250,000,000, over three fifths of which come from Great Britain and pay an enforced tribute, necessitated by a commercial policy adopted in the interest of British manufacturers, while the whole commerce must pay the profits of English merchants and ship-owners. The excess of exports, amounting to \$120,000,000, consists of little else than the annual drain to Great Britain. The impoverishment of the people by the extortions of their conquerors has resulted almost in the extinction of the arts of weaving, dyeing, metal-working, etc., which might, in the present development of international com-

merce, be a source of much wealth. There are, however, reasons for expecting a slow improvement in the material condition of the people of India, if no political convulsion intervenes to prevent the effect of causes now working. The English people are more solicitous for the welfare of the Indian subjects since the famine of 1877, and wish their burdens to be lightened by every reform which would not conflict with English mercantile interests. The net-work of railroads which has already been built ought to contribute to the prosperity of the country, not merely by developing its natural resources, but by allowing the military force to be reduced, and thus lightening the taxes; although the Secretary of State expresses himself as unable to see any way of diminishing the military expenditures. The mineral wealth of India has never been at all developed. Coal-mines have been opened within the last twenty years, and in 1879-'80 the wants of half the railroads and factories in the country were supplied. There is a coal-bearing area covering 30,000 square miles. The most promising branch of industry has been cotton-manufacturing. There were in 1880, in Calcutta and Bombay, 53 spinning and weaving mills, employing 1,500,000 spindles. Besides supplying a considerable proportion of the domestic needs, a trade sprang up in fabrics manufactured from native-grown cotton with China, where they were preferred to the spurious products of Lancashire. This trade increased in five years from \$1,000,000 to nearly \$5,000,000. This industry was encouraged by protective duties, but is to be stifled in the interests of Manchester. The late Government by an artful stroke reduced the duty in such a way as to render it useless for revenue purposes, and to plunge the whole trade into confusion, and the present Government is looking for an excuse to throw it off entirely. The exports of cotton manufactures from Great Britain to India are \$105,000,000 in value, being 28 per cent of the total exports of Great Britain, and 70 per cent of the total import trade of India.

The sudden changes in the policy of the Government which are made by every new administration would hinder the progress of any country, and their effect on the conservative temper of the Hindoos is to paralyze the spirit of enterprise and to vex and irritate the people perpetually. Every time there is a change of government in England there is an entire reversal of policy in India in great things and small things. The "forward" policy alternates with the policy of "masterly inactivity," and the bewildering spectacle is next presented of the victorious British army being made, in the words of Lord Beaconsfield, to "cut and run from the scene of a splendid conquest." One administration tears up the broad-gauge railroads to lay down the narrow gauge, another replaces the broad gauge, and the next changes it again. Public works half completed

are abandoned by an incoming administration. The income-tax, which was imposed by Lord Mayo, was removed by Lord Northbrook; Lord Lytton substituted a license-tax; and in the latter part of 1881 all India was thrown into a state of consternation by the rumor that Lord Ripon intended to reimpose the income-tax, in order to abolish the favorite cotton duties. An income-tax is not popular in more enlightened countries, and in India it is regarded as a grinding oppression and a very badge of servitude.

A land reform which is to be carried out in Bengal is similar in its main features to the scheme inaugurated in Ireland. The Bengal land bill, like its Irish counterpart, is an extension of principles which were first laid down in a former bill. Before 1793 the East India Company was the sole proprietor of the whole of the soil. By the land law of that year the land was divided among a number of private persons. The population increased and the competition for land became so great that the landlords drew enormous rents from the land, and the tillers were kept on the verge of starvation. In 1859 the state partially recalled the privileges it had conferred on the proprietors by defining the tenant-rights, which were reserved in vague and ineffective terms in the original law. The tenant-rights in ancient times, before the confiscation of the soil by the East India Company, and while the country was sparsely inhabited, were nearly tantamount to actual ownership. The population has increased rapidly since 1859, and the people are rack-rented in spite of the act of that year. The rent commission, which was appointed in 1879, now proposes to restore, in a great measure, the tenant-rights which existed under native rule. The peasantry are to be given a heritable and assignable right in their holdings, and the landlords to be considerably restricted in their power to augment the rents.

On the 28th of March the state of Mysore, which has been governed by English officials for fifty years, was restored to native rule. The young maharajah, who assumes the sovereignty with the same status as the rulers of the other native states, is still kept in a measure under tutelage, being surrounded by English counselors, who, according to the expectation and understanding, will direct his acts.*

* This prince belongs to the dynasty which founded the kingdom of Mysore in 1563, successfully defending it against the Mohammedan conquerors of a great part of the ancient kingdom of Vijayanagara, of which it was a portion. In the last century Mysore was conquered by Hyder Ali, but when his successor, Tippoo, was defeated at Seringapatam by the British, they restored the Hindoo dynasty. The rajah, who was a minor when placed on the throne in 1799, after attaining his majority began a career of vice, cruelty, and oppression, which reduced the country to such a distressful state that, in 1831, Lord William Bentinck interposed. He declined to annex the country, but placed it under a British administration, which ruled in the name of the rajah. Sir Mark Cubbon administered the province until 1861, when it was placed in charge of the Mysore Commission, a large staff of English officials employed, and the government assimilated to that of the British provinces. The old rajah died in 1863. His adopted son was carefully reared under European and native teachers, as the successor to the throne, in which he was installed not long after attaining his majority.

The elements of disorder are always at work in India, and the country is in a constant state of incipient rebellion. Through the ignorant and arrogant application of English methods, which are unsuited to the habits of the people, there is a vast army of homeless and desperate people scattered through the provinces. Whole trades and industries are supplanted by the introduction of new processes or new products, an entire peasantry is evicted because a famine has prevented them from paying their debts, or even through the operation of a new code of law which is unsuited to the character of the people. The disbandment of large numbers of native soldiers after the late war furnished a dangerous addition to the ranks of the idle and discontented. The rigorous enforcement of forest regulations has lately created serious dissatisfaction in the highlands of Western India.

The simple aborigines of the Sonthal country were wrought up into a dangerous state of disquietude by the census. They were worked upon by an ascetic preacher, named Habami, and led to fear that the enumeration boded some terrible act of oppression. Another fanatic, Babajee, leader of the sect of Kherwars,* had still more influence in exciting the natives. The extortions of money-lenders and of landlords were important elements in the Sonthal disturbances, as they are in many of the insurrectionary movements in India. The last resettlement of rents resulted in an increase of 70 per cent on the average, so that the people were naturally suspicious of official operations. Troops were distributed through the country, and the census regulations were considerably modified, precautions which were necessary to prevent a general rising.

A foolish but desperate conspiracy was brought to light in the native state of Kolapore in January. A company of dakoits, or gang-robbers, were proved on their trial to have engaged in the dakoities in order to obtain the means to carry out a plot for the deposition of the maharajah in favor of their leader, Ghode Bawa, who pretended to be the dead prince Chima Sahib, who was deported after the Sepoy rebellion. The conspirators were said to have numbered thousands, and to have been twice prevented by accidental circumstances only from attempting to murder all the Europeans and plunder the city, and were fully prepared

* The Kherwar sect was founded by Bhagrit Mangi in 1875, after the raising of the rents at the last settlement. He gave out that he was sent by Heaven to deliver the Sonthals from British rule, and consequently from grinding rents, which bear heavily on the poverty-stricken husbandmen, and the exactions of the usurers to whom they are driven, and whose hard terms are enforced by the British officials. He was crowned as a king and enshrined as a divinity, exercising an unbounded influence over the simple tribesmen until he was convicted and imprisoned. His disciples continued to prophesy a divine deliverance from the British yoke, and made use of the mistrust excited by the census operations to arouse the people to rebellion. Their leader, Dhubia Gossain Babajee, was arrested a couple of months before the date of the enumeration, and sent to Lucknow as a state prisoner.

for the final attempt when the leaders were arrested.

The whole of Western India seems to be honeycombed with Brahmanical conspiracies. The Bheels, a savage aboriginal tribe of Meywar, in Rajpootana, were imposed upon by similar stories of the malignant purposes of the census to those which were told to the Sonthals, and exasperated by the rigorous execution of the license law; and in April the tribes gathered, killed a number of officials, and besieged a detachment of Sepoys sent to suppress the riots. In making peace with the Bheels the Government agreed to remit the taxes, and grant all the other demands of the Hill-men.

The high-caste Brahmins are indefatigable conspirators. The Mohammedans do not so often engage in secret intrigue, but are addicted to sullen and moody discontent, and are constantly subject to fanatical influences, and in danger of being wrought up to the point of a general and desperate rebellion. These two classes have during 1881 given the Government in the Punjab and other parts of native and British India much trouble by their quarrels with each other. The Hindoos were in every case the aggressors, and in many places attacked the Mohammedans on the ground that they sold and ate beef, which was an offense to the Brahmins.

The Viceroy's Council, the majority of whom were nominated by the late Government of Great Britain, protested strongly against the evacuation of Candahar. The military authorities also advocated its retention as a valuable strategical base, and the continuance of an open British protectorate over Afghanistan as a bulwark against a Russian advance toward India. The Kuram was given over to the Turi tribe, and the Kaibar to Afridi tribes, subject to regulations, and with pledges of British protection. Candahar was delivered over to a force sent by Abdurrahman from Cabool (see AFGHANISTAN), and Pishin only remained in possession of the British, out of all the occupied territory.

Several border outbreaks occurred during the year, and British outposts all the way from Burmah to Pishin were attacked. A large military expedition marched against the Mahsud section of the Waziri tribe, who plundered Tank and other villages in 1879. An engagement occurred on May 3d, at Shahalum, near Kanigoram, and a skirmishing resistance was offered to the advance of both of the invading columns; but when they reached their destinations, Tank and Bunnoo, most of the chiefs had made their submission.

The Maharajah of Nepal died in May, after a reign of thirty-four years. His minister, Jung Bahadur, dictated the policy of his whole reign. He was succeeded by his grandson, whose mother is a daughter of Jung Bahadur.

W. P. Adam, who for his services as Liberal "whip" in Parliament during the Conservative rule was given the governorship of Madras,

died in May, in the commencement of a promising career as an Indian administrator, for which he was prepared by his former services as Lord Elphinstone's private secretary in Bombay.

INDIANA. The biennial session of the Legislature of this State commenced on January 6th and closed on April 16th. One of the earliest measures of the Legislature was the election of a Senator in Congress. The nominees were Benjamin Harrison, Isaac P. Gray, and Gilbert De La Matyr. The vote of the Legislature was: Harrison, 81; Gray, 62; De La Matyr, 2. Harrison was elected Senator from March 4, 1881.

In the House, the following joint resolution was passed by a vote of 84 yeas to 1 nay:

Resolved, By the General Assembly of the State of Indiana, that our Senators and Representatives in Congress are hereby respectfully requested to procure the enactment of a law making provision for the soldiers of the Mexican War who have accepted in good faith the results of the war of the rebellion, and whose disabilities have been removed by act of Congress.

The words of this resolution exclude only the President of the Confederate States.

An important tax bill was brought before the Legislature. It had been carefully revised and considered, by the most experienced officials in the State, and some of its provisions may afford valuable suggestions in the preparation of a similar law in other States. One of the principal aims of the framers of the bill was to devise some plan by which to assess and collect taxes upon the large amount of property that has hitherto escaped taxation, and, at the same time, to avoid discrimination against any persons or corporations. The assessment law is so framed that no man can escape listing his property without absolutely and willfully committing perjury, for which he will be liable to heavy penalties. The deputy-assessors, as they go from house to house, have the authority to administer an oath to each person at the time when the return is handed in. It is made an offense, with heavy penalties attached, for a man to convert property into greenbacks just before the time of assessment, unless it can be shown that this was not done for the purpose of avoiding taxation. Then, again, as to Government bonds, it is provided that each person claiming exemption as the possessor of bonds, must give, for the information of the assessor, but not as a matter of public record, the numbers of the bonds held by him; and thus will be prevented the transfer of bonds from one person to another on the day of assessment, so that the same bond frequently does duty for half a dozen members of the same firm, and exempts from taxation property worth thousands of dollars which ought to be taxed. When the numbers of the bonds belonging to a certain person are known, the same bonds can not be used by another person, on the day of assessment, to claim exemption, without ex-

citing suspicion and leading to inquiry. Another clause of the bill will strike the fast-freight and sleeping-car lines, whose property used in the State has hitherto escaped taxation. The railroad company upon whose line the fast-freight cars are in use on the day of assessment are required to list them for taxation, and the same for sleeping-cars; and the act authorizes that the company may deduct the amount of taxes levied from their payments to the transportation lines to whom the cars belong. At present fully two thirds of the cars used in freight service by the railroads doing business in Indiana belong to foreign corporations, and thus escape taxation, although used by the local roads.

The act makes the county treasurer and auditor the county board of equalization, instead of the township assessors, and they are given full power to increase or diminish, add to or take from, the assessment lists any property which may have been omitted or improperly inserted. None but infants and insane persons are exempted from taxation, married women who own property being compelled to list it for taxation the same as men. Churches are still exempted for their actual buildings and ten acres of ground, and schools and colleges are allowed an exemption for a *campus* of not exceeding forty acres. A provision is made for the redemption within thirty days of personal property sold for taxes. Another provision is that if a treasurer has failed to make collection, after attempting the sale of land or property, when three years have elapsed, it becomes the duty of the treasurer to transfer the matter over to the prosecuting attorney of the judicial circuit, who shall proceed to foreclose and sell the property through the agency of the sheriff; and if there is still a failure to obtain a bid for the property equal to the amount of the tax due, and no compromise can be effected, the delinquent is to have the benefit of what is called "a year of jubilee," and the cloud resting upon the title to his property is to be removed.

A whipping-post bill was favorably reported in the House, by the Committee on Rights and Privileges, all dilatory motions were voted down, and it was ordered to be engrossed, but failed to become a law.

It was proposed to extend to the whole State the plan for the improvement of the condition of pauper children, which had been adopted in some of the counties. There are about seven hundred children of sound mind, between the ages of two and sixteen years, in all the county poor-houses. The execution of the plan consists in putting these children under the care of a matron, a woman of good moral character and sound judgment. The children are provided with food and clothing, sent to the public schools, and given home training and education. They are as if in a home. No uniform clothes them. They would not be distinguished from any other children. It is believed that

they would thus be cut off from old associations and be brought under good influence, and would grow up into useful, industrious, and self-supporting citizens. For the maintenance of these children the matron receives not less than twenty-five nor more than thirty cents a day, each. In this home there are never to be more than twenty-five children, as, when the number exceeds that, a second home is provided. As fast as possible the matron finds homes for the children in different parts of the State, thus cutting off their dark past and opening up a hopeful future. The advantages of such county homes are—their cheapness, their simplicity, the home feature about them, the personal care instead of institutional, and the individual training each child receives.

An unsuccessful effort was made to effect the passage of a bill providing for the compulsory education of children. Some features of the bill will illustrate the method adopted to secure this object. The first section was as follows:

SECTION 1. Be it enacted by the General Assembly of Indiana, That every parent, guardian, or other person having charge or control of any child between the ages of eight and fourteen years, shall be required to send such child to a common school for at least twelve weeks in each school year, at least six weeks of which shall be consecutive, unless the township trustee, or board of trustees, as the case may be, having control of the school district or sub-district in which such parent, guardian, or person resides, excuse such child from attendance, when it appears to the satisfaction of such trustee or board of trustees that the child's bodily or mental condition is such as to prevent its attendance at school or application to study for the time required, or that its time and labor are essentially necessary for the support of an indigent parent, brother, or sister, or that it is being otherwise furnished with the means of education for a like period of time, or has already acquired branches of learning ordinarily taught in common schools; provided, however, if the common school of the district or sub-district in which such parent, guardian, or person resides is distant two miles from his residence by the nearest traveled road, he shall not be liable to the provisions of this act.

The penalty for a failure to comply with the provisions of the bill is a fine upon the parents or guardians of not less than two dollars, or more than five dollars, for each child not attending school, and the same fine shall be collected for each day that each child is absent. In 1879 the number of school-children enumerated amounted to 708,101, and the number enrolled was 503,892, leaving 204,209 children out of the public schools. In 1880 the enumeration amounted to 703,558, and the number enrolled to 511,283, showing that 194,275 children of school age did not attend the public schools—a gain in attendance, as compared with 1879, of 9,934. It was not known what percentage of these absentees from the public schools attended private schools, nor what percentage were unable to attend on account of sickness, poverty, or other causes justifying their absence. But, in the absence of proof, it was assumed that a very small percentage of the absentees were denied the privilege of attending the public

schools of the State for causes which might warrant the enactment and interposition of a compulsory education law.

The law adopted at the previous session of the Legislature, which created a radical change in the long-established manner of selecting and drawing juries, has gone into operation. The law declares that the Circuit Court shall, during the last term beginning in the calendar year, appoint two persons as jury commissioners, who shall be freeholders and voters of the county, well known to be of opposite politics, and of good character for intelligence, morality, and integrity. The following oath is to be taken by the commissioners:

"You do solemnly swear (or affirm) that you will honestly, and without favor or prejudice, perform the duties of jury commissioner during your term of office; that in selecting persons to be drawn as jurors you will select none but persons whom you believe to be of good repute for intelligence and honesty; that you will select none whom you have been or may be requested to select; and that in all of your selections you will endeavor to promote only the impartial administration of justice."

The names to be drawn as jurors shall be taken by the commissioners from the tax duplicate of those who shall be legal and qualified voters of the county. All the juries for the year shall be drawn from a list of names made up at the same time by the commissioners, by writing on slips of paper, of uniform shape, size, and color, the names of twice as many persons as will be required by law for grand and petit jurors in the courts of the county for all terms of such courts, to commence within the calendar year next ensuing. The key to the box in which the names are placed shall remain in the custody of one of the commissioners, not of the same politics as the Clerk of the Circuit Court.

The law also provides that "within a period of not more than one week preceding the commencement of any term of court, the clerk, having first well shaken the box, shall draw therefrom a sufficient number of names to make up the jury required, whether it be petit or grand jury. In counties where the Superior Court may have more than one judge, the clerk shall, if so directed by such court or judges, in like manner draw one or more additional petit juries for such court at any term." A jury can be discharged at the expiration of four weeks, and the clerk be ordered to draw another. In case numerous challenges are made, the court can order the clerk to draw from the box such number of names as shall be deemed proper, and the persons drawn shall be summoned by special venire. If, by reason of such special drawing, or otherwise, the names in the box shall be exhausted, so that any of the courts can not be furnished, the judge shall require such jury commissioners "to deposit in the box such additional number of names as the court may order." The com-

missioners are appointed by the judges of the Circuit Court.

The validity of the vote on the constitutional amendments in April, 1880, having been denied by the judges of the Supreme Court, an act was passed to submit them again to a popular vote on March 14th. They have been presented in the previous volume of this annual. It may not be superfluous to explain the objects to be accomplished by them.

The first amendment requires the residence of voters to have been six months in the State, two months in the township, and six weeks in the precinct immediately preceding the election.

This bar to the importation of voters and the invasion of our State from other States for political purposes secures to the voters of the locality and of the State the control of their own political affairs, free from the interference of corrupt and dangerous invaders. It is the corner-stone of local self-government.

The third amendment fixes elections for State officers in November, authorizes the election of judges on a separate day, and allows the Legislature to make a registry law. It is in accord with the laws of other States and the United States, and it adds another safeguard to the fair exercise of the right of suffrage, saves the extra expense of two elections every four years, enables the identification of the legal voters, and puts the choice of the highest judicial officers beyond the range of party spirit.

The second and fourth amendments make the Constitution of Indiana conform to the Constitution of the United States as to the rights of colored citizens.

The fifth amendment authorizes the grading of fees and salaries in proportion to population and necessary services required. Some of the county officers receive greater pay than judges of the Supreme Court, Governors, or members of Congress. This restriction was expected to save hundreds of thousands of dollars annually.

The sixth amendment grants power to establish inferior courts, and makes the administration of justice more speedy and economical. The growth of business population, and wealth; the vast interests begotten by great corporations; the rapid social progress, and the multiplied agitations consequent upon the enterprise of the people, all demand a more complete, prompt, and efficient judicial system.

The ninth amendment restricts the powers of cities, towns, and counties to incur indebtedness beyond a certain rate, and puts a check upon an evil that has grown to enormous proportions in all parts of the land, which will blight the growth and paralyze the energies of the most enterprising communities unless arrested by constitutional restraint.

The vote on the amendments was smaller than at the previous election, but the majority was much larger, and secured their adoption. The vote was, for the first amendment, 123,-

736; against, 45,975; majority, 77,761: second amendment—for, 124,952; against, 42,896; majority, 82,056: third—for, 128,038; against, 40,163; majority, 87,875: fourth—for, 125,170; against, 42,162; majority, 83,008: fifth—for, 128,731; against, 38,348; majority, 90,386: sixth—for, 116,570; against, 41,434; majority, 75,136: ninth—for, 126,221; against, 36,435; majority 89,786.

As the close of the session drew near, the Governor issued a call for the Legislature to hold a special session, which by the Constitution might be continued for forty days. This was rendered necessary by the accumulation of business resulting from the attempt of the Legislature critically to consider the vast body of legislation proposed for adoption by the commission appointed by the act of 1879 to compile and revise the existing statutes of the State.

The acts of the session were strictly of a local nature. A joint resolution was adopted proposing an amendment to the Constitution whereby the manufacture and sale of liquor of any kind for purposes other than mechanical, medicinal, and sacramental, shall be unlawful. Another joint resolution for the amendment of the Constitution proposed to give to women the right of suffrage at all elections; another proposed to lengthen the terms of county officers to four years; and another increases the number of Supreme Court judges.

The joint resolution to prohibit the manufacture and sale of intoxicating liquors, as above mentioned, was adopted, instead of a stringent liquor law, which a large body of the members of the Legislature were pledged to support. In the House it was passed by a vote of 47 yeas to 36 nays. The vote of both Houses was politically divided as follows:

PARTIES.	For.	Against.
Republicans.....	66	11
Democrats.....	11	44

The returns of the census of 1880 have not yet been fully compiled; but, by those of 1870, the number of establishments in the State at that time which would have been closed up by such a constitutional amendment was as follows:

	Distilleries.	Breweries.
Establishments.....	36	99
Hands employed.....	280	443
Capital invested.....	\$653,898	\$1,117,410
Wages paid.....	126,150	175,730
Materials used.....	1,358,196	627,576
Product.....	2,138,420	1,315,116

At the same session the legal disabilities of married women to make contracts were changed as follows: A married woman may hold property and control it as if she were unmarried, and may in her own name sell, exchange, and convey her personal property. She shall be bound by estoppel and by her covenants of title, but she shall not become a surety. Mar-

ried women shall be liable for their torts, and the husband shall not be liable for the contracts or torts of his wife unless where torts are committed with his consent. If he has received property through her he shall be liable to that extent for her debts contracted before marriage. The wife alone shall be liable for repairs of her property. Where the husband deserts his wife and children, or is sent to the penitentiary, or is an habitual drunkard, or refuses to live with his wife, and also fails to provide for his wife and children, the wife may commence an action to recover any obligation in favor of the husband, and the court may make allowances out of the same, and the court may also order the real or personal property of the husband to be sold or leased to make provisions for his wife and children, or the court may authorize the wife to convey or encumber the real estate without the husband joining in the deed or mortgage. This last provision also applies where the husband is insane.

The Legislature of 1879, appreciating the difficulty of making a revision, provided that the Supreme Court judges should appoint three persons as revision commissioners. The judges accordingly appointed three distinguished members of the bar, the result of whose labors appears all through the acts of 1881, and will further appear in the acts of 1883, not only in a briefer and better expression of the old statutes, but also in the addition of many new provisions. Their services will also extend to a better arrangement of the sections of the laws, with appropriate catch-words at the head of each section, and with a careful and elaborate index, and annotation citing the decisions of the courts, and with the correction of occasional misprints.

In the year 1880 there were devoted to the production of cereals 6,972,191 acres, as follows:

CEREALS.	Acres.	Production, bushels.
Barley.....	16,399	262,885
Buckwheat.....	8,846	89,707
Indian corn.....	3,673,420	115,482,300
Oats.....	623,531	15,599,518
Rye.....	25,400	803,105
Wheat.....	2,619,695	47,284,853
Total.....	6,972,291	179,141,563

Estimating the population of Indiana at 2,000,000, it will be seen that the acres devoted to bread-crops amounted to something more than three acres per capita, with a product above eighty-eight bushels per capita.

The crop of tobacco in the State, as returned to the Census Bureau, presented the following result:

Acres, acres.....	11,955
Production, pounds.....	8,372,642
Value of crops in farmers' hands.....	\$443,642 00
Value per 100 pounds.....	5 00
Value per acre.....	37 10
Cost of production per 100 pounds.....	3 60
Difference between cost and value per 100 pounds	1 40

The State Bureau of Statistics for 1881 reports the acreage of oats at 556,103; that of 1880, 823,847.

By the chief of the same bureau, some statistics of the diseases of domestic animals in the State were obtained. There are in all 1,011 townships, of which 457 made reports relative to these diseases. The diseases to cattle, as reported, are ten in number, and are named as follows: milk-sickness, mouth-and-foot disease, black-leg, mouth-disease, catarrhal Texas fever, dry murrain, garget, erysipelas, weed in bag, and itch. These diseases, with diseases unknown, killed in 1880 328 cattle. The total number of deaths, if all the townships had reported, would have been, at the same rate, 454 out of a total of 973,143 cattle in the State, or 1 in 2,143½. The diseases of horses and mules reported are distemper, yellow water, epizootic, lung-fever, colic, glanders, quinsy, farcy, blind staggers, and spinal disease. These destroyed during the year 981 horses and mules. There were destroyed during the year 1,670 sheep by foot-rot, scab, grabb, and by dogs. The dogs did about as much harm as disease, for they killed 818 sheep of 1,670 reported. The only disease of hogs is cholera, and this malady carried off 119,647.

This State Bureau also reports that 274 companies or firms are engaged in coal-mining and 445 in stone-quarrying. The Indiana coal-fields embrace an area of over 7,000 square miles, offering seven workable seams at a depth ranging from 50 to 220 feet, and averaging 80 feet below the surface. The seams vary in thickness from 2½ to 11 feet, averaging 4½ feet. The quality is fair to good, as shown by analyses in the geological reports. An area of 600 square miles in this field yields a superior "block" or "splint" coal, which is used in the blast-furnace as it comes from the mine, without coking. It may be had on every line of railway at from 5 to 10 cents per bushel, or at from \$1.50 to \$2.80 per ton. Indiana has inexhaustible beds of fire and potters' clay, brick clay, cement, lime, sandstone, paving-stone, and limestone of superior quality, with extensive mines of kaolin.

The Governor made the appointment of Calvin Fletcher, of Owen County, the Fish Commissioner of the State. He is required, among the duties assigned to him, to examine the various lakes, rivers, streams, and water-courses of the State, and ascertain whether they can be rendered more productive in the supply of fish; also, what measures are desirable and expedient to effect this object, either in propagating and protecting the fish that at present frequent the same, or in the selection and propagation of other species of fish therein, or both. Said commissioner shall also inquire into and test the best modes of artificial propagation of fish in the various waters of the State, and shall procure and superintend the procuring of the fish, fish eggs or spawn, necessary for such waters and the propagation of the fish therein.

The expenses of the State Prison North during the year ending October 31st exceeded the receipts \$1,359. The number in prison at that date was 572. Of these prisoners the number who could read and write was 446, and the number who could neither read nor write was 100. The number who could read only was 26; the number born in the United States was 501. At the time of conviction 5 were under fifteen years of age, 117 were between fifteen and twenty years, 184 between twenty and twenty-five years, and 114 between twenty-five and thirty years.

In the Southern Prison at the same date there were 518 convicts: 120 were minors at the time of conviction, 137 between twenty and twenty-five years of age, 110 between twenty-five and thirty, and 1 was over sixty-five; 125 were intemperate, and 228 could not write.

In the Insane Asylum the whole number treated during the year was 1,738, and the average daily number resident was 1,070. The ratio of recoveries on admissions was 49 per cent, and the ratio of deaths in the whole number treated was 6½ per cent. The number of insane in the State is estimated at about 2,500.

In the Deaf and Dumb Institution, for the year ending October 31st, there were 405 pupils admitted and 61 dismissed, leaving 344 enrolled. On the basis of 100 per cent as perfect, the superintendent gives the following figures as the average of the pupils of all grades for four years: 1878, 84 per cent; 1879, 83 per cent; 1880, 85 per cent; 1881, 86 per cent. In the mechanical and industrial departments equal progress has been made, and of the 61 discharged a large number were prepared to pursue vocations that they had learned at the institution.

In the Blind Asylum 122 pupils are enrolled, comprising representatives of nearly all the counties of the State. Three courses of study, literary, musical, and industrial, are now open to the inmates. More than 1,500 pieces of fabric work have been made by the girls during the year, and the boys have been equally successful in their departments.

The State Bureau of Statistics has prepared a table which shows the relative value of the cost of machinery to the agricultural product. The annual value of implements, which includes repairs, is obtained by dividing the first cost by the number of years the implements will last. The price and duration are obtained by consulting a large number of dealers and intelligent farmers. The value of the products is obtained from reports made to the bureau by 1,100 township assessors throughout the State, and is based upon the average of the last three years. The results of these statements are that the annual cost of agricultural implements and machinery is \$3,647,833.90; the annual value of agricultural products, \$97,395,505.50; the ratio of annual cost of implements to annual value of production is \$1 to \$26.69. Benton

County gives the best return, the cost being but \$1 for every \$48 worth of production. It is followed by Tippecanoe County, with \$1 to \$43. Several others are nearly even, and raise the average of the State to \$1 to \$27. There is much difference in the conditions of the counties. For instance, in some the wear of machinery by the nature of the soil, etc., is much greater than in others; the market for purchasing implements is often so convenient as to materially increase their cost by frequent

and unnecessary purchases; and the market for the sale of products is extremely variable. In considering the table, all these conditions are to be taken into account, as it is probable that, if the same status existed throughout the State, the table might be very materially changed.

Following is the population of the State by counties, as finally returned by the census of 1880, and as compared with the population of 1870:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.
Adams	15,835	11,382	Hendricks	22,981	20,277	Pike	16,363	13,779
Allen	54,763	43,434	Henry	24,016	22,986	Porter	17,227	13,942
Bartholomew	22,777	21,133	Howard	19,584	15,847	Posey	20,857	19,185
Benton	11,108	5,615	Huntington	21,805	19,036	Pulaski	9,851	7,801
Blackford	8,020	6,272	Illusion	23,050	18,974	Putnam	22,501	21,514
Boone	25,222	22,598	Jasper	9,464	6,354	Randolph	20,435	22,832
Brown	10,264	8,651	Jay	13,252	15,000	Ripley	21,627	20,977
Carroll	18,845	10,152	Jefferson	25,977	29,741	Rush	19,288	17,626
Cass	27,611	24,198	Jennings	16,453	16,218	Saint Joseph	33,178	25,322
Clarke	28,610	24,770	Johnson	19,537	15,966	Scott	8,343	7,578
Clay	25,584	19,054	Knox	26,324	23,531	Shelby	25,287	21,892
Clinton	23,412	17,330	Kosciusko	26,434	23,531	Spencer	22,122	17,998
Crawford	12,956	9,551	Lagrange	15,630	14,148	Stark	5,165	8,589
Davless	21,952	16,747	Lake	15,001	12,839	Steuben	14,045	12,453
Dearborn	26,671	24,116	La Porte	30,985	27,062	Sullivan	20,336	18,453
Decatur	19,779	14,053	Lawrence	18,543	14,628	Switzerland	13,586	12,134
De Kalb	20,225	17,167	Madison	27,527	22,770	Tippecanoe	35,066	38,515
Delaware	22,926	19,030	Marion	102,752	71,939	Tipton	14,407	11,923

INDIGO, ARTIFICIAL PRODUCTION OF. The industrial reproduction of the most valuable coloring matter derived from organic nature is the latest and the crowning achievement of the coal-tar industry. This great industry affords a striking argument in favor of the practical utility of the cultivation of science for purely scientific objects; since here, as in many other cases, the study of the deeper problems of nature has led incidentally to great improvements in the arts of life. The inventor of the artificial process of preparing indigo is a distinguished German chemist, Professor Bayer. His discovery was published in 1880. Bayer set out with the definite object of discovering the synthesis of indigo. His study of its composition in the light of the modern theory of atom-linking or molecular arrangement led him to the conclusion that it is built up of one molecule of benzole, containing a side chain of two carbon-atoms, and on this latter a nitrogen-atom in the ortho-position. In searching for bodies whose transformation products showed a similar arrangement of atoms, he discovered derivatives of cinnamic acid which seemed to present the same molecular grouping. Cinnamic acid was formerly obtained only from certain costly resins, as storax, tolu,

and Peru balsams. It has, however, recently been produced synthetically by the action of acetyl chloride on benzaldehyde; and a cheaper process has been found in which benzole chloride is treated with acetate of soda. The chloride of benzole with its derivative aldehyde are produced from toluole, one of the waste products of coal-tar distillation. Bayer's discovery of the synthesis of indigo led to extensive experiments with derivatives of cinnamic acid, to find a process of conversion capable of industrial utilization. The derivative best adapted for the purpose was found to be ortho-nitro-phenyl-propionic acid, which, when treated with alkaline reducing agents, produces indigo directly. Nitro-phenyl-propionic acid is a yellowish-white powder in the dry state. It is obtained in the following manner: Cinnamic acid is first nitrified with nitric acid, the product being a mixture of ortho-, meta-, and para-nitro-cinnamic acids. To separate the ortho acid, which is the one used in indigo manufacture, they are converted into methylic ethers by the aid of hydrochloric acid and wood spirits, and the ethers are separated by fractional distillation. From the para acid, which is the most abundant by-product, a beautiful red dye has been obtained. The me-

thylic ether of the ortho acid is saponified with dilute soda lye, thus being converted into methylic alcohol and the soda salt of the acid, from which salt the acid is set free by substitution of another acid. The acid, when dried, is converted into dibromo-ortho-nitro-cinnamic acid by the absorption of liquid or gaseous bromine. The bromine is then released by an alkali taking with it two atoms of hydrogen to form hydrobromic acid. The abstraction of the hydrogen converts the nitro-cinnamic acid into a new substance, which is nitro-phenyl-propriolic acid.

The recovery of the expensive chemical materials used, such as methylic alcohol and bromine, necessitates a large outlay for apparatus and labor. Like all such complicated chemical processes, when carried out on an industrial scale, it is exceedingly difficult to obtain the materials in a state of purity and to prevent the reactions from being accompanied by secondary reactions, which spoil the product. Toluole is always accompanied by the homologues xylol and cumol, and in nitrating and bromiding substitution products will be formed instead of the isomer desired, unless expensive methods of purification are resorted to. At the present stage of the new industry it is impossible to produce indigo by the artificial process to compete in price with the natural indigo. Ortho-nitro-phenyl-propriolic acid yields true indigo; this can be converted into indigo carmine, and acts in all respects like the natural dye, while the color is handsomer than that of the best Bengal indigo. It is possible that, among the numerous combinations which may be made, some other body may be discovered which will possess as valuable coloring properties as indigo, and whose production will be attended with fewer difficulties. Meanwhile, the artificial production of the nitro-phenyl-propriolic acid, notwithstanding its expensiveness, is established on a firm commercial basis because of a valuable adaptation which makes it more desirable to the calico-printer than natural indigo. Indigo can be prepared for direct printing on calico by an expensive process which was known to but few. Most calico-printers resorted to the still more troublesome method of dyeing the goods in the indigo-vat and then biting out the spots which were to be printed in other colors. The discovery of the new compound from which indigo can be easily developed does away with all this labor. The nitro-phenyl-propriolic acid is mixed into a paste, with which the figures are printed upon the calico. It is converted into indigo-blue by the abstraction of one of the atoms of oxygen, differing from reduced indigo, or indigo-white, which is reconverted by the absorption of an oxygen-atom. The deepest shades can be produced from the new material either by mixing it with the reducing agent, or preferably by impregnating the fabric with the reducing agent, before printing. The reducing agents first used were grape and milk sugars. Heat

was required with these to develop the color, and great difficulty was experienced in regulating the temperature and time of exposure. Xanthogenate of potassium is now employed, with which the color develops spontaneously in the cold in from twelve to twenty-four hours. By first impregnating the fabric with the reducing agent the color develops in the fiber, whereas if it is mixed with the printing material the color forms too rapidly. The reducing agents act only in alkaline solutions; but the weaker the alkali the more perfect the color, so that alkaline salts, like borax, are preferred. A disadvantage of the new material, which may yet be overcome, is that the color can not be developed by superheated steam; hence, it is impossible to use it in conjunction with the steam dyes.

INSANITY AS A DEFENSE FOR CRIME.

The shooting of President Garfield, and the defense set up in behalf of the assassin, occasioned a fresh discussion of the relations of insanity to crime, the validity of the plea of insanity as a defense in murder cases, and the measure of evidence required to establish it. This was not only made the subject of general discussion, but received an unusual degree of attention as a matter for judicial interpretation. (For various expert opinions, and the application of legal principles in Guiteau's case, the reader is referred to the article in this volume on *GUITEAU'S TRIAL*.)

The discussion has turned largely upon questions as to what really constitutes insanity, how far its various phases destroy responsibility in those affected by it, whether the insane of various classes should be held amenable to punishment for their acts, and what are the legal requirements as to proof when a plea of insanity is set up. Dr. E. C. Seguin defines six categories of persons subject to mental aberration, who are liable to commit crimes during its continuance. First are those liable to attacks of epilepsy. The epileptic conditions are usually of short duration, and accompanied by hallucinations of sight and hearing, and followed by complete amnesia, the patient having no recollection of what he has said or done during the attack. Second are cases of transitory mania or fury, in which the patient acts upon an irresistible impulse. Dr. Seguin considers genuine cases of this class as exceedingly rare, and says that it covers many instances of "sham" insanity, pleaded in defense of crime. In the third class are those who commit criminal acts in the course of simple functional insanity, as mania and melancholia, under the influence of hallucinations and delusions. These persons believe firmly in the state of things presented in their delusions, and act upon it without any ability to reason upon the consequences. They simply act in accordance with the unreal conditions which to them seem real. The fourth category includes those who are at first subject to very little general intellectual disorder, but

have a special mania, such as imagining they are persecuted or watched, and in danger of being waylaid by secret enemies. Fifth are persons afflicted with general paresis or paralytic dementia, who are liable to break out into acts of fury directed against any object that for the moment excites anger or hostility. Sixth is "the enormous group of feeble-minded persons, whether primarily imperfect and weak or become demented later in life," which "furnishes many of the insane criminals, and probably fully as many criminals who are considered sane by the law. . . . In all varieties of this class of feeble-minded persons," says Dr. Seguin, "actions, whether simply offensive or criminal, result from the execution of instinctive or reflex tendencies, not controlled as in health by knowledge of right and wrong, by fear of punishment, by a healthy will. In short, judgment and self-restraint are impaired or absent in these cases." This writer expresses the belief that "the criminal insane should be held just as responsible to human punishment—i. e., preventive and educating punishment—as sane criminals." He would have special accommodations provided for their restraint and treatment, and in most cases he thinks the isolation should be perpetual, as the malady from which the criminal impulse springs is incurable. In the case of that acute curable mania, whose victims commit crimes under the stress of delusions, he says that the isolation should be continued until a long interval of mental health gives assurance that the attacks will not recur.

Dr. J. S. Jewell, in treating of the same subject, defines three groups of cases: those in which "the individual becomes the subject of a more or less enduring impulse, or strain, of urgent inclination, toward a particular wrong or criminal act," with a knowledge of its character, but an increasing inability to resist; those in which the victim is subject to overpowering delusions, and "absolutely devoid of moral responsibility"; and those "in which profound modifications of the moral sense do not exist, nor any single definite morbid impulse arising from disordered emotion, so often seen in impulsive monomania or the simpler forms of insanity of feeling, but in which the chief feature is lack of consecutiveness in mental action. Dr. Jewell declares that there may be partial insanity, affecting "one single mental function or group of functions," or involving a certain "degree of aberration in any given direction." He is therefore of opinion that questions of responsibility can be answered only by a "careful study of each case on its own merits, and the application to it of the practical criteria to be obtained from a study of average healthy human beings, observed, as far as possible, under conditions identical with those under which the criminal act was committed." As a practical suggestion, he says that the examination should be made, in any case on trial, not by expert witnesses called on

either side, but by an expert commission, entirely independent and unbiased, assigned to the "task of aiding the judge and jury (after due questioning by court and counsel), not only to learn what are the facts, but how to estimate or value them."

Dr. C. F. Folsom says: "Uncomplicated with other mental diseases, moral insanity is, in my opinion, so seldom observed as to constitute one of the curiosities of medical experience; and then it is associated with symptoms so well marked as to make a diagnosis not difficult, although the term, like masked epilepsy, is frequently resorted to as a cover for respectable drunkards, or thieves, or murderers, or to furnish a willing jury an excuse to acquit of homicide the man who kills his wife's seducer, or the young woman who shoots her betrayer. So long as the responsibility of the insane is decided upon the grounds—1. That there must be other evidences of insanity than the crime; 2. That the whole group of symptoms must correspond to definite disease; 3. That the crime must be a part of the natural history of the disease; 4. That a reasonable degree of self-control should be exercised, according to the capacity for it in each case—we are on a secure footing; and these points must be decided by competent authority, from full consideration of all the circumstances and conditions of each case." The same authority says: "A man distinctly insane by the medical criterion is irresponsible for crime when the conditions defining his legal responsibility are at the time of the act—1. Sufficient mental capacity for ordinary reason, reflection, and judgment; 2. The knowledge of right and wrong as applied to the particular act; 3. The power of self-control within reasonable limits; 4. The absence of insane delusion overpowering reason—the character and strength of the false belief to be judged in each particular case, and not by any general definition of insane delusion, that being impossible. What would be an insane delusion in one man under certain circumstances might be entirely otherwise in another with different conditions. The further from reason and probability and the more persistent a delusion, the more is it an indication of some unsoundness of the whole mind; but an insane man may be quite irresponsible, whether his acts were justified or not, supposing the facts suggested by his delusion were true, provided his mind were so weakened that he could not reason correctly from his false premises."

Dr. I. J. Elwell expresses his entire dissent from the doctrine of moral insanity, and doubts the propriety of allowing insanity in any form to be a defense for crime: He says: "If society can not be securely protected against the sane assassin without destroying him, which seems to be the settled conviction of mankind, it is equally necessary to destroy the 'emotional' and 'moral' insane, for society is as much, if not more, in danger from this unstable

and uncertain class as from the sane murderer, who might live to see the error of his evil way, and abandon it; while the insane, because of less intelligence and more obtuse sensibilities, is not so easily influenced." He further says: "The fear of punishment or dread of death is as great in case of the insane as of the sane, and has the same restraining influences; therefore, the insane criminal is morally responsible for his acts."

Dr. William A. Hammond, writing on "The Punishability of the Insane," says: "Regarding the matter from the stand-point that all laws are for the protection of society, and that the principles of abstract justice, as between the offender and society, have no necessary place in jurisprudence, there seems to be no valid reason why, if the protection of society demands it, the insane should not be punished for violations of law, even though they be morally irresponsible for their acts by reason of delirium, dementia, morbid impulse, emotional insanity, or any other form of mental aberration." And again: "The influence of example is not lost on the insane, or those who are on the verge of mental alienation. Every medical officer of an asylum, or other physician who sees many cases of insanity, knows that lunatics are capable very generally of being influenced by rewards for good, or punishments for bad, conduct. Now, there are many persons passing through life scarcely suspected of insanity, but who, nevertheless, are the subjects of mental alienation. They only require an adequate existing cause to produce such a state of mental disturbance as to turn the scale decidedly, and urge them to the perpetration of some overt criminal act—usually a murder. If these people are made to understand that they will be held legally responsible for their conduct, and punished if they are found guilty, they will make such efforts to control themselves as will probably prove successful." He further remarks: "Thus we see that an individual may be medically insane, and yet not a lunatic in a legal sense. His brain is diseased, either temporarily or permanently; his mind is not in all respects normal in its action—and yet he is responsible for his acts. Many of the insane are clearly irresponsible, and their punishment is demanded only by the imperative necessity which exists of securing the safety of society by preventing their committing criminal acts. This should be done in that way which experience shows is most conducive to the accomplishment of the end in view, even if it involves the taking of the life of the lunatic."

Mr. Edward B. Hill, a legal writer on the subject, takes the broad ground that insanity should not be regarded as a defense for crime at all. He says: "But behind and beyond the question of what proof of insanity should be required lies the question—which does not seem to have occurred to many people—whether insanity should be a defense in capital cases at

all. It may seem at first startling to put it as a debatable matter, but that it is at least open to argument a little consideration will show. Capital punishment differs from other forms of punishment, in that it is no part of its aim to work any reformation in the criminal. The two aims of punishment in general are, however, as prominent here as anywhere else. These aims are: 1. To prevent repetition of the offense by the criminal; 2. To prevent commission of the offense by others. Both kinds of punishment rely on the same means of effecting the second object, which is the dread of the punishment inflicted in a given case; but to effect the former object capital punishment removes from the criminal all power of ever acting at all, while milder forms rely upon the dread of again incurring them to induce the criminal to abandon his evil ways. The theory of the two clearly is, that one who commits the higher offenses is supposed to be so depraved that nothing but his death can protect society from him, while in the other cases it is supposed that less extreme measures will suffice. Now, if these views are applied to the case of a lunatic, it will be seen that every argument that can be adduced to show the necessity for the death of a sane murderer has tenfold more weight in the case of an insane murderer. If it be hopeless that a sane murderer should ever cease to be dangerous, it is certainly so in the case of a lunatic. He is possessed of an insane delusion, under the influence of which he has committed one murder and may commit others, or (if we accept the theory of 'emotional insanity') he is liable, under certain circumstances, to be so much excited as to be irresponsible, and in that state to commit murder. If committed to an asylum, he may so far improve as to be discharged as cured, and yet he may have a recurrence of the dementia, which may again impel him to a performance of new crimes. Society is never safe while he lives." This writer holds that moral guilt has nothing to do with the question, as it is the province of human law to punish acts that are harmful to society without regard to their moral aspects. On this point he says: "It is of the essence of punishment that it should have an ulterior end beyond the infliction of the penalty, and this ulterior end (as to the criminal) is that he, by experiencing the penalty of his offense, should be deterred from a repetition of the crime. It would, in general, be manifestly vain to hope for such an effect upon a lunatic, and therefore such punishments are not applicable to him. But in capital cases the only aim of the law is to destroy the offender, and remove by his death a danger to society which can be removed in no other way. The danger to society from an insane murderer is, at least, as great as from a sane murderer, and society has as much need of protection in the one case as in the other. If it is vain to hope that the sane murderer, who is open to the effects of

milder penalties, can be rendered harmless while he lives, it is still more so in the case of an insane murderer, upon whom milder penalties would have no effect. Every argument that will apply in favor of the death-penalty at all, will apply with greater force in the case of the insane than in that of the sane, with, perhaps, one seeming exception. This exception is that of the argument derived from the deterrent effect of the example upon others who might be tempted to commit the same crime. Of course, if insanity were no defense, it would never be falsely set up by one accused of murder; but would the death-penalty have any deterrent effect upon those not yet guilty? It would certainly take away one hope for escape from the sane murderer *in posse*, and it may be doubted whether it would not have some effect upon the insane, who certainly seem sometimes to calculate upon the immunity which their state affords them. But whether this be so or not is really immaterial. The great object of the death-penalty is the death of the criminal, and this being attained, and society being freed from the menace of his existence, the rest is but of secondary importance." He therefore urges the policy of destroying insane murderers "as we do any one or anything else whose continued existence threatens the general safety of society."

Judicial definitions of insanity in murder cases have acquired a new interest in view of the discussion that has arisen. Precedents that are regarded as more or less authoritative run back to the time of Lord Hale, who laid down this rule: "Such a person as, laboring under melancholy distempers, hath yet ordinarily as great understanding as ordinarily a child of fourteen years hath, is such a person as may be guilty of treason or felony." In 1725, in the case of Edward Arnold, indicted for shooting at Lord Onslow, Mr. Justice Tracy said, in charging the jury: "If he was under the visitation of God, and could not distinguish between good and evil, and did not know what he did, though he committed the greatest offense, yet he could not be guilty of any offense against any law whatsoever." And further: "If you believe he was sensible and had the use of his reason and understood what he did, then he is not within the exemptions of the law." In the case of Lord Ferrers, tried for murder in 1760, the solicitor-general stated the question thus: "Was he under the power of it [insanity] at the time of the offense committed? Could he, did he, at that time distinguish between good and evil?" The rule of law was stated thus: "If there be a total permanent want of reason, it will acquit the prisoner; if there be a total temporary want of it when the offense was committed, it will acquit the prisoner; but if there be only a partial degree of insanity mixed with a partial degree of reason, not a full and complete use of reason, but (as Lord Hale carefully and emphatically expresses himself) a competent use of it

sufficient to have restrained those passions which produced the crime; if there be thought and design; a faculty to distinguish the nature of actions; to discern the difference between moral good and evil—then, upon the fact of the offense proved, the judgment of law must take place." In the case of the Queen against Oxford, Lord Denman laid down the rule thus: "The question is, whether the prisoner was laboring under that species of insanity which satisfies you that he was quite unaware of the nature, character, and consequences of the act he was committing, or, in other words, whether he was under the influence of a diseased mind, and was really unconscious, at the time he was committing the act, that it was a crime." In the celebrated and much-quoted case of *McNaughten* Lord Chief-Justice Tindal instructed the jury that "the question to be determined is whether at the time the act in question was committed the prisoner had or had not the use of his understanding, so as to know that he was doing a wrong or wicked act." This case gave rise to a discussion in the House of Lords, and the questions involved were submitted to the judges for an authoritative decision. In their answers the judges said that, in case of insane delusion under the influence of which the accused sought to redress or revenge some supposed grievance or injury, or produce some supposed public benefit, he was "punishable according to the nature of the crime committed, if he knew at the time of committing such crime that he was acting contrary to law"; there was no exemption from responsibility unless, "at the time of the committing of the act, the party accused was laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing; or, if he did know it, that he did not know he was doing what was wrong"; if the accused was under an insane delusion as to existing facts and committed an offense in consequence thereof, he "must be considered in the same situation as to responsibility as if the facts with respect to which the delusion exists were real." These decisions are regarded as fixing the rule for the English courts.

In the United States there has been great divergence of opinion. In some States the question is left to the jury, in a general way, as to whether insanity caused the crime; in others, knowledge of right and wrong is made the test, as in England; in still others, the test of a knowledge of right and wrong is coupled with an inquiry as to the defendant's power to control his actions. The right and wrong test may be said to have prevailed generally in the Federal courts, and in those of the States of New York, New Jersey, California, Missouri, Wisconsin, Tennessee, Texas, Alabama, Louisiana, Virginia, North Carolina, Georgia, Mississippi, Maine, Delaware, and Nebraska. This test is modified by admitting the question of power to apply the knowledge and to control action,

in the States of Massachusetts, Pennsylvania, Ohio, Kentucky, Minnesota, and Iowa. The question of responsibility is left, in a general way, to the jury, in New Hampshire, Indiana, Illinois, Michigan, and Kansas.

The rule of evidence as to the proof of insanity has also been the subject of divergent views and opinions. From these, three different rules have been evolved: 1. Insanity must be proved by a preponderance of evidence; 2. Insanity must be proved beyond a reasonable doubt; and, 3. If the jury have a reasonable doubt of sanity, they must acquit. English authority is strongly in favor of the position that, when insanity is pleaded by the defense, it must, in the language of the judges, in their answers in regard to *McNaughten's* case, be "clearly proved." In the United States there is some conflict and inconsistency in the decisions, but New Jersey seems to stand alone in requiring the defense to prove the insanity beyond a reasonable doubt. The burden of proof is held to be upon the prisoner, but the degree of proof is not distinctly defined, in the States of Massachusetts, Maine, Pennsylvania, Delaware, Virginia, Ohio, Georgia, Alabama, Louisiana, Mississippi, Missouri, Texas, Minnesota, and California. The same appears to be the case in the Federal courts. In New Hampshire, New York, Indiana, Illinois, Kentucky, Kansas, Tennessee, Michigan, Nebraska, and North Carolina, it has been generally held that, where the jury have a reasonable doubt of the prisoner's sanity, they must acquit him. The extremes have been presented in the contiguous States of New York and New Jersey. In the case of *Spencer*, in the latter State, Chief-Justice Hornblower said that "every man is presumed to be sane until the contrary is clearly proved. . . . The proof of insanity at the time of committing the act ought to be as clear and satisfactory, in order to acquit him on the ground of insanity, as the proof of committing the act ought to be in order to find a sane man guilty." In the case of *McCann*, in New York, on the other hand, the judge said: "If there be a reasonable doubt about the act of killing, all will concede that the prisoner is entitled to the benefit of it; and if there be any doubt about the will, the faculty of the prisoner to discern between right and wrong, why should he be deprived of the benefit of it, when both the act and the will are necessary to make out the crime?" In the case of *Cole*, tried for killing *Hiscock* in a fit of jealousy, on account of the alleged seduction of his (Cole's) wife, the jury, in asking for further instructions, stated that they "found the prisoner to have been sane at the moment before and the moment after the killing; but they were in doubt as to his sanity on the instant of the homicide." Judge *Hogeboom* charged the jury that "they must give the prisoner the benefit of the doubt, if they had such rational doubt, founded upon the evidence, and could believe such doubt to be well founded upon such con-

dition of the case as was presented by this statement of the jury."

On the 2d of December, 1881, the trial of *Elizabeth Coleman* for the murder of *George T. Coles* was completed in the Court of Oyer and Terminer in the city of New York. The charge of Chief-Justice Davis to the jury was as follows:

Insanity is usually spoken of, both in common language and in the books, as a defense to crime. But it is no defense, because, where the insanity recognized by the law exists, there can be no crime to defend. An insane person is incapable of crime. He is devoid, both in morals and in law, of the elements essential to the constitution of crime, and hence is an object of pity and protection, and not of punishment. Therefore, whenever it is established that a party accused of crime was, at the time of its alleged commission, insane within the established rules of the criminal law, he is entitled to acquittal on the ground of innocence, because of incapacity to commit the offense, however monstrous his physical act may appear. Both humanity and the law revolt against the conviction and punishment of such a person. But insanity is a condition easily asserted, and sometimes altogether too easily accepted. Hence juries, while they should be careful to see to it that no really insane person is found guilty of crime, should be equally careful that no guilty person escapes under an ill-founded pretext of insanity.

It is important that juries on trials of alleged crime should clearly understand what insanity is, within the established rules of the criminal law. Without such rules the administration of justice in such cases would be dependent upon the shifting caprices of judges, or the equally unsubstantial passions or prejudices of jurors. In this State the test of responsibility for criminal acts, where insanity is asserted, is the capacity of the accused to distinguish between right and wrong at the time, and with respect to the act which is the subject of inquiry. This rule is stated by the authorities in different forms, but always in the same substance. In one case it was said, "The inquiry is always brought down to the single question of a capacity to distinguish between right and wrong at the time the act was done." In the most authoritative of the English cases it is said, "It must be clearly proved that, at the time of committing the offense, the party accused was laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know he was doing what was wrong." And, in a very late case in our Court of Appeals, a charge in that language was held to present the law correctly to the jury. So you will see, gentlemen of the jury, that, in this case, the firing by the prisoner of the shot by which the deceased was killed being proved and admitted, the question whether the act was criminal depends upon your finding, as a matter of fact, whether, at the time of doing the act, the prisoner knew what she was doing, and that she was doing wrong; or, in other words, did she know that she was shooting the deceased, and that such shooting was a wrongful act? If she did know these things, her alleged insanity is not established within the rules of the law, however much you may be convinced that she acted under the intensest emotional excitement, or however fully she believed she was justified in avenging her own wrongs, or however much you may think the deceased was deserving of punishment. "The doctrine that a criminal act may be excused upon the notion of an irresistible impulse to commit it when the offender has the ability to discover his legal and moral duty in respect to it, has no place in the law"; and there is no form of insanity known to the law as a shield for an act otherwise criminal, in which the faculties are so disordered or deranged, that a man, though he perceives the moral

quality of his acts as wrong, is unable to control them, and is urged by some mysterious pressure to the commission of the act, the consequences of which he anticipates and knows. This is substantially the language of the Court of Appeals in the case already referred to. If it were not so, every thief, to establish his irresponsibility, could assert an irresistible impulse to steal, which he has not mental or moral force sufficient to resist, though knowing the wrongful nature of the act; and, in every homicide, it would only be necessary to assert that anger or hatred or revenge, or an overwhelming desire to redress an injury, or a belief that the killing is for some private or public good, has produced an irresistible impulse to do a known illegal and wrongful act. Whatever the views of scientists or theorists on the subject of insanity may be, and however great a variety of classification they may adopt, the law, in a criminal case, brings the whole to the single test—did the person doing the act at that time have sufficient sense to know what he was doing, and that it was wrong to do it? If that be his condition, it is of no consequence that he acts under an irresistible influence or an imaginary inspiration in committing the wrong. Emotional insanity, impulsive insanity, inspirational insanity, insanity of the will or of the moral sense, all vanish into thin air whenever it appears that the accused knew the difference between right and wrong at the time and in respect of his act. No imaginary inspiration to do a personal and private wrong, under a delusion or belief that some great public benefit will flow from it, when the nature of the act done, and its probable consequences, and that it is in itself wrong, are known to the actor, can amount to that insanity which in law disarms the act of criminality. Under such notions of legal insanity, life, property, and rights, both public and private, would be altogether insecure; and every man who, by brooding over his wrongs, real or imaginary, shall work himself up to an irresistible impulse to avenge himself or his friend or his party, can with impunity become a self-elected judge, jury, and executioner, in his own case, for the redress of his own injuries, or of the imaginary wrongs of his friends, his party, or his country. But, happily, gentlemen of the jury, that is not the law; and whenever such ideas of insanity are applied to a given case as the law (as too often they have been), crime escapes punishment, not through the legal insanity of the accused, but through the emotional insanity of courts and juries. I have felt it my duty in this case to give you my views of the law of insanity as applicable to the case in emphatic terms; but I assure you, gentlemen, I have had no intention, in doing so, to affect your minds in determining the facts of the case to which you are to apply the law. The prisoner is entitled to a consideration of the facts of the case by you, uninfluenced by any expression of opinion in respect of them by the court.

The Court of Appeals of the same State rendered a decision bearing upon this subject on January 17, 1882. The opinion of the judges, written by Judge Danforth, was in the following terms:

The appellant was convicted of an assault with intent to kill. The conviction was affirmed by the General Term of the Supreme Court, and upon appeal from that decision two points are made in his behalf: 1. That the court erred in charging the jury. In support of this proposition it is assumed by his counsel that the judge charged that "the defense of insanity is an affirmative defense, and the prisoner is bound to satisfy the jury by proof that he was insane." 2. That he erred in refusing to charge that the defendant was entitled to the benefit of any reasonable doubt arising on the evidence as to sanity or insanity. We think neither are well taken. The questions upon the trial were: 1. Were the acts charged committed by the prisoner? 2. At the time of the commission was he in such condition of mind as to be responsible

for them? If answered in the affirmative, the acts constituted crime and the conviction was proper. As to each, therefore, the burden was upon the prosecutors, for upon the existence of both the guilt of the prisoner depended. This result follows the general rule of evidence, which requires him who asserts a fact to prove it. That the first proposition is established is not denied—the legal presumption that every man is sane was sufficient to sustain the other until repelled, and the charge of the judge, criticised in the first point made by the appellant, goes no further. If the prisoner gave no evidence, the fact stood; if he gave evidence tending to overthrow it, the prosecution might produce answering testimony; but in any event he must satisfy the jury upon the whole evidence that the prisoner was mentally responsible, for the affirmative issue tendered by the indictment remained with the prosecutor to the end of the trial. Without going to other authorities, these observations are warranted by *Brotherton vs. The People* (75 N. Y., 159), where the general rule above stated was applied to questions similar to those before us. It was not violated by the trial court. After referring to the acts constituting the offense charged and the rules of law applicable thereto, the learned judge called attention to the fact alleged in behalf of the prisoner that he was an insane man at the time they were committed, and so not responsible therefor, and directed them to determine from the evidence whether or not such is the fact. "He is presumed," the court said, "to be a sane man until he convinces you by evidence that he is insane"; defined insanity in a manner not objected to, and said, "If such was the prisoner's condition, he was relieved from the responsibility, otherwise he was responsible for that which he does"; and in conclusion said, "If you have a reasonable doubt from the evidence that the prisoner is guilty of this crime, then you should give him the benefit of that doubt." These words related to and covered the whole issue tendered by the indictment. It is quite impossible that the jury should have misapprehended them. The prosecution had conducted the case upon the theory that the burden was upon him of maintaining as part of that issue the sanity of the prisoner. This further appears from his request. When anticipating that the jury might fail to find the greater offense, the District Attorney asked the court to charge that "if the jury find the wounds were inflicted by the prisoner, and that he was sane, etc., they could convict of an offense lesser in degree," and the court complied. Here, again, as well as in the preceding part of the charge, the sanity of the prisoner is made the necessary element in the definition of the crime; it therefore was not necessary to comply with the request of the prisoner's counsel and charge as requested by his second point. The substance of the request was embraced in the charge made, and the court could not be required either to repeat it or answer again to different portions as analyzed by counsel. We think the charge will not bear the conclusion on which the first point of the appellant rests, and, as the trial was conducted without error, that the conviction should be affirmed.

A few days later, on the 23d of January, James B. Graves was convicted of murder in Newark, New Jersey, the plea of insanity having been set up. The judge delivered an elaborate charge to the jury, in which he said that the law entertained no prejudice against insanity as a defense. It respected it, but insisted that it should be clearly proved that insanity existed. The burden of proof rested on the accused. The law presumed every man sane until he was proved insane. The judge continued:

Insanity is a disease and not a transient impulse of the mind, and manifestations of the existence of the

disease, before and after the commission of the deed, would naturally be expected. Many of the forms and degrees of mental disease which in the judgment of learned men would be regarded as insanity are utterly rejected by the law in the administration of criminal justice. The law regards insanity as a disease of the mind, implying fixedness and continuance of mental condition. It therefore rejects the doctrine of what is called emotional insanity, which begins on the eve of the criminal act and ends when it is consummated. The doctrine of moral insanity as a defense to a criminal accusation has been repudiated by an almost unbroken current of decisions as hostile to the principles of law and to the welfare of society. If the persons from whom the subjects of criminal law are derived should be permitted to prosecute their avocations because they are such as their moral propensities have led them to adopt, the object of organized society—the preservation of life and property—would be defeated. Stripped of its high-sounding name, moral insanity is wickedness, depravity. Laws are made and courts are established for the suppression of crime begotten of such causes, and therefore moral insanity—crime excused on the ground of defective or perverted moral sense—has no place in the criminal law. Furthermore, the law not only considers insanity, when offered as a defense to a criminal charge, as a disease of the mental faculties, but it also prescribes the degree of the mental disorder or disease which shall be exacted as the condition on which a defense of insanity shall be allowed, for it is not every kind nor every degree of insanity that will render a man irresponsible for acts of atrocity. The law does not require as the condition on which criminal responsibility shall follow the commission of crime the possession of one's faculties in full vigor or a mind unimpaired by disease. The mind may have been so weakened by disease as not to be capable of realizing the enormity of the crime, or may have become so irritable and excitable through a life of degrading vice and sensual indulgence as to induce an undue resentment of injuries and insults, and yet the accused will be criminally responsible for his acts. To establish a defense on the ground of insanity it must be clearly proved that at the time of committing the act the accused was laboring under such a defect of reason, from a disease of the mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that what he was doing was wrong. If an accused has sufficient mind to know the difference between right and wrong with respect to the act which he is doing, and to control his conduct under ordinary circumstances, he can not discharge himself from responsibility by showing that he did the act under the influence of an irresistible impulse.

(For the charge of Judge Cox in the Guiteau case, see *GUITEAU'S TRIAL*.)

INTERNATIONAL MONETARY CONFERENCE. (See *BI-METALLIC STANDARD*.)

IOWA. The vote for President in 1880 was: for the Garfield electors, 183,927; Hancock electors, 105,845; Weaver, 32,701; Dow, 592.

The Greenback State Convention of the present year assembled at Marshalltown on the 1st of June, about 250 delegates being present. The nominations were as follows: For Governor, D. M. Clark, of Wayne County; Lieutenant-Governor, Hon. James M. Holland, of Henry County; Supreme Judge, Hon. A. B. Dabney, of Madison County; Superintendent of Public Instruction, Mrs. Mary E. Nash, of Des Moines. The following platform was adopted:

1. The right to make and issue money is a sovereign constitutional power to be maintained by the people

for the common benefit. We demand the abolition of all banks of issue, and the substitution of full legal-tender greenbacks in lieu of their notes.

2. We oppose the refunding of the national debt or the issue of interest-bearing non-taxable bonds upon any pretext, and demand the payment and destruction of those outstanding at the earliest possible moment.

3. We demand a gradual income-tax whereby capital shall bear a just share of the public burden.

4. We regard the act substituting a railroad commission for laws governing freight rates in this State, a fraud procured by the railroad companies through a Republican Legislature, and demand its repeal. While we favor liberal national appropriations for the creation and improvement of water-ways, we demand laws protecting the people of Iowa from discrimination, pooling, watering of stock, drawbacks, or rebates, and all unjust charges on the part of railroads, until such time as the people, who built most of these roads with land-grants, taxes, and subsidies, shall own and officiate or fully control them.

5. We demand a revision of our patent-right laws, placing a fair limit upon the royalties of inventors, and protecting the people from injustice.

6. We demand that all land grants forfeited by reason of the non-fulfillment of conditions by railroad companies shall be at once reclaimed by the Government, and henceforth that the public domain be reserved exclusively for homesteaders or actual settlers.

7. We demand absolutely democratic rules for the government of Congress and State Legislatures, placing all representatives of the people upon an equal footing, and taking from all committees a veto power upon proposed legislation.

8. We demand the repeal of the restrictions of the right of suffrage in many States or its abolition in the District of Columbia, and demand equal political rights for all men and women.

9. Believing that all questions affecting the public interest should be directed by the people, we favor the submission of the proposed constitutional amendment to the popular vote.

10. We demand that all ballots in this State shall be of uniform size, color, and material, and that each party having a State organization shall have one member on the Election Board of each township and precinct.

11. In the furtherance of these ends we ask the co-operation of all men and women, without regard to previous party affiliation or prejudice.

Resolutions were also passed extending the sympathies of the convention to the Land League of Ireland, and to all down-trodden people of the whole globe; thanking Governor Plaisted, of Maine, for his veto of the bill by the Maine Legislature to incorporate a State Bank; and favoring the election of the President and Vice-President and United States Senators by a direct vote of the people.

The Democratic State Convention met in Des Moines June 16th, seventy-four counties being represented by over four hundred delegates. The following platform was adopted:

The Democratic party of Iowa, assembled in convention, reaffirms the national platform of 1876 and 1880; demands strict economy in all public expenditures, the strict accountability of all public servants, and declares:

1. For tariff reform ultimating in a simple revenue system with commercial freedom as its issue.

2. That we oppose all sumptuary laws, and the proposed prohibitory amendment to the Constitution in all its steps and stages, as the most offensive form of sumptuary legislation.

3. That the great agricultural and producing interests of the country should be emancipated from the

burdens of monopoly put upon them by Republican rule, and, as a feature of such relief, for the cheapening of transportation by Government appropriation for and improvement of the Mississippi River with its navigable tributaries and other water-ways.

4. That we execrate the constant official corruption grown into an invariable Republican practice, and that the demand of our national platform for civil-service reform is fully emphasized by the amazing spectacle of Republican factions disturbing the public peace not by agitation of great measures of statesmanship, but by a vulgar quarrel over a partition of public spoils and a squabble for the opportunities of official theft.

The nominations were as follows: For Governor, L. G. Kinne, of Tama County; Lieutenant-Governor, J. M. Walker, of Polk County; Supreme Judge, H. P. Hendershott, of Wapello County; Superintendent of Public Instruction, Professor W. H. Butler, of Delaware County.

The Republican State Convention met also in Des Moines on the 28th of June, over one thousand delegates being present, and every county represented. Buren R. Sherman was nominated for Governor after twelve ballots. For Lieutenant-Governor, O. H. Manning, of Carroll County, was nominated; for Supreme Judge, Austin Adams, of Dubuque, was renominated. The nominee for Superintendent of Public Instruction was Professor John W. Akers, of Linn County. The platform adopted by the convention was as follows:

We, the representatives of the Republican party of Iowa, demand of the people of the State anew their fullest confidence and support because of the faithfulness of the party in the State and in the nation to party pledges; because of the magnificent results it has achieved in the line of good government; because of the marvelous devotion it has shown in support of the Union; because of its abhorrence of slavery and polygamy, and of its successful efforts to crush the one and of its persistent struggle to get rid of the other, sure to go on to its final extirpation; because of its active interest in the relief of struggling and oppressed humanity everywhere; because of its determination to abolish all inequalities of citizenship, to give all men of all races and nationalities in this land equality of civil and political rights; because of its efforts to establish temperance, to educate the people, and to upbuild all moral forces; because it has been earnest in efforts toward honest and economical government, and has been swift to correct abuses when it has discovered them; because it has steadily maintained the financial honor of the nation, is rapidly discharging its great war debt, and has made the recent financial history of the government the marvel of the nations; because it has protected the labor of the country, and built up its agricultural and manufacturing interests, and promoted the means of internal commerce by judicious legislation; because it is positive and progressive, and will, in the future as in the past, prove its capacity to grapple promptly and successfully with every emergency of the nation, and with every question affecting the people's interests; and, finally, because it will secure a complete and lasting unification of the country, entire peace and concord, upon statute basis of free schools, free speech, a free press, and a free ballot.

In the spirit of the purpose that has redeemed former pledges and produced these results, the Republican party of Iowa resolves:

1. We reaffirm the Republican national platform of 1880, and insist upon its enforcement in its relation to the several affairs of the nation, the States, and the Territories, in order that sound policies shall prevail in the nation, and ample protection be afforded to its citizens in all of their rights of citizenship in the

several States; and that the Territories be made as absolutely free from the debasing presence and pernicious influences of polygamy as the States now are of slavery.

2. We congratulate the country upon the election of James A. Garfield, and the national Administration upon the vigorous manner in which it has undertaken to ferret out fraud and suppress extravagance in public expenditures, to secure the personal and commercial rights of our people abroad, to deal justly with the Indian wards of the Government, and upon the conspicuous success of its financial policy.

3. That we are in hearty sympathy with the spirit of recent conventions for supplementing and improving the great water-routes of the nation, and cordially indorse all measures which look toward a practical and judicious improvement of the magnificent water-ways which Nature has afforded us for cheaply transporting the immense commerce of the State, and therefore developing the immense resources of the interior of our national domain.

4. That we recognize railways as one of the most potent agencies in our national progress, but one which, by reason of its relation to the people, must be kept subordinate to the interests of the people, and within the legislative control of Congress and the State; that in the spirit of its usefulness it must be dealt with in fairness and without injustice. But we are in accord with the popular demand, that unquestionable legislative power shall be used to protect the people from any abuse and unjust exactions.

5. That the plenary power of Congress over the subject of patents should be so exercised as to protect the people against the wrongs and abuses which have been developed and are practiced under the present system of laws relating to patent rights, and we ask our Senators and Representatives in Congress to lend their best efforts toward the accomplishment of this end.

6. That the position attained in our commerce by American meats and live animals demands the enactment of effective legislation by both the nation and the States for the suppression of such diseases as are calculated to interfere with this important feature of our foreign trade.

7. That in pursuance of the uniform justice of the Republican party to observe the pledges and perform the promises made and given in its platforms, we declare that the provisions in the platform of 1879, for the submission of the so-called prohibitory amendment of the Constitution of Iowa to a vote of the people at a special and non-partisan election, should be enforced, in order that the good faith of the party may be maintained, and that the people in this government of the people, by the people, and for the people, may have an opportunity to express their wishes concerning the pending amendment, regardless of party affiliations and with perfect freedom from all party restraint and influence.

The election in October resulted in the choice of the Republican candidates. The vote for Governor was as follows: Sherman, 133,323; Kinne, 73,395; Clark, 28,146; William Johnson (Anti-Secret Society), 191.

The Legislature was constituted as follows: Senate, 45 Republicans, 2 Democrats, 2 Greenbackers, and 1 Independent; House, 70 Republicans, 22 Democrats and 6 Greenbackers. The finances of the State are in a favorable condition. At the beginning of the biennial period ending September 30th there was no money in the general revenue fund of the State. During the term that fund received \$2,126,900.90. There was disbursed \$2,035,050.39, leaving a balance on hand in general revenue of \$91,850.51. The warrants drawn

against general revenue amount to \$1,940,249.-87. In addition there was paid for interest on warrants \$10,063.45, which makes the aggregate cost of carrying on the government of the State for the term, \$1,950,323.32, leaving an excess of receipts over expenditures of \$176,-587.58 in general revenue.

The amount of warrants outstanding on September 30th was \$22,093.74, as against \$96,-993.54 two years before.

The war and defense debt has been paid, except the warrants for \$125,000 negotiated by the Executive, Auditor, and Treasurer, under the law of the Eighteenth General Assembly, and \$2,500 of the original bonds not yet presented for payment. The only other debt owing by the State amounts to \$245,435.19, due to the permanent school fund, a portion of which is made irredeemable by the Constitution. These facts place Iowa practically among the States which have no debt. The expenses of the State for the past two years are less than those of any other period since 1869, and this notwithstanding the fact that the State is to-day sustaining several institutions not then in existence, namely, the Hospital at Independence, the Additional Penitentiary, the Normal School, and the Asylum for the Feeble-minded, besides the Girl's Department of the Reform School. The State also, at present, makes provision for fish-culture, for a useful weather service, for sanitary supervision by a Board of Health, for encouraging immigration to the State, for the inspection of coal-mines by a State Inspector, and liberally for the military arm of its government. These causes of increased expenditure are only partially offset by the largely reduced cost of supporting the Soldiers' Orphans' Home, although here a small additional expenditure is necessitated by the admission of indigent children to the Home. This diminished expenditure, notwithstanding the State's population has augmented over fifty per cent since 1869, argues an economical management of the affairs of the State government. The Auditor estimates that the expenditures for carrying on the State government during the current period will be \$1,787,850; and that the receipts of general revenue from all sources will be \$2,202,700, leaving a surplus of \$415,150, as available for extraordinary expenditures. The report of the Treasurer of the State shows that at the beginning of the biennial period there was in the State Treasury, of all funds, \$74,187.37; that the receipts for the period were \$2,514,262.08, aggregating \$2,588,449.45; and that the disbursements for all purposes were \$2,409,897.71, leaving a balance, at the end of the term, of \$178,551.74, belonging to the several funds as follows: Agricultural College endowment, \$84,104.72, coupon, \$329.85; permanent school, \$226.66; and general revenue as above, \$91.-850.51; which showing corresponds with that made in the Auditor's report. All the Agricultural College endowment fund except \$476

is invested in county, city, and school district securities, bearing interest at rates varying from five to eight per cent per annum. There are 20,468 volumes in the State Library. The State has an effective military force, consisting of two brigades, aggregating 2,282 men, well armed and uniformed.

The number of school-children reported is 594,750. Of this number 381,192 are, by approximation, between the ages of six and sixteen years. The number of all ages enrolled in the schools is 431,513. The average attendance is 254,088. The schools of the State have been in session, on an average, 148 days. The receipts for all school purposes throughout the State were \$5,006,023.60, and the expenditures \$5,129,279.49; but of these receipts and expenditures about \$400,000 was of money borrowed to refund outstanding bonds at lower rates of interest. The amount on hand aggregated, at the end of the fiscal year, \$2,653,356.-55. The Governor recommends the passage of a compulsory education law. The receipts of the State University were \$118,739.35; expenditures, \$114,159.13. The assets of the institution amount to \$233,100.26. Of the ninety-nine counties of the State, seventy-two are represented by students in the Agricultural College. Its endowment fund amounts to \$630,-315.05. There are doing business in the State sixty-six banks and over 140 insurance companies. Of public lands there remain unsold 619,264.69 acres, besides a number of town-lots. There was expended for the support of the Institution for the Deaf and Dumb, during the biennial period, the sum of \$70,568.17, and for the College for the Blind the sum of \$50,-183.15. The amount expended for the support of the Soldiers' Orphans' Home and Home for Indigent Children was \$33,429.85; Asylum for Feeble-minded Children, \$49,537.77; Hospital for the Insane at Mount Pleasant, \$177,203.-89; Hospital at Independence, \$150,792.86. In view of the fact that there are fully 1,500 insane persons in the State, the larger number of whom are incurable, and that about 500 of this number are not in the insane hospitals, but are maintained for the most part in county poor-houses, the erection of a hospital for Incurables in the central part of the State was contemplated. The amount expended for the support of the two departments of the Reform School was \$50,880.98. With respect to the State Prisons, the Governor says:

Has not the time arrived when the General Assembly should inaugurate a system of graded prisons, so that those who are convicted of the graver offenses and sentenced for longer terms, and those convicted a second time, should be imprisoned at Fort Madison, and those whose terms of service are shorter should be sent to Anamosa? It is certainly against the reformation of the young criminal who is imprisoned, perhaps for his first offense, to be brought into daily contact with those who are hardened in crime, and for whom there is little hope of reform. In my judgment, a much larger proportion of the younger class of criminals would, warned by their past experience, become good citizens when their term of service ex-

pires, than is the case at present, if it were not for the contaminating influence of older, vicious, and hardened convicts with whom they are compelled to work day by day, during their term of service. The theory of the law is that criminals are punished not only for the crime committed, but as an example to others. The reformation of the criminal is at the same time incidentally forwarded by means of opportunities for education, religious teachings, and consolation, and an ample supply of books, all of which accord with the true theory regarding the reclamation of criminals. Another step in a humanitarian direction would be, after the State has been reimbursed its outlay on account of the convict's crime, to allow him his proportion of the surplus earnings, over and above the cost of his support. It is not in accordance with the dignity of the State to make money out of the convict's labor, or to enter into competition with free labor.

The Governor also remarks :

During the past four years there has been brought to Iowa, under the auspices of humane societies, for the purpose of finding them homes, a large number of children of both sexes. These children have been picked up on the streets, kept in some charitable institution for a short time, and then sent West by the car-load, and bound out to our people. While the object sought by those managing this work is a good one, yet I am sorry to say that the results, in the main, are not such as could be desired. Many of these children are of the "hoodlum" type, criminals by heredity, and, almost immediately on their arrival in the State, leave the homes provided for them, and take to vicious practices, and, because of the superior acumen superinduced by their former method of living, exercise a bad influence on the children they are brought in contact with. A notable example of this was seen in the recent successful attempt to throw a train from the track of one of our principal railroads, whereby a valuable life was lost, and all the passengers on the train imperiled. How many of these children have been brought to the State I am not aware, but of those brought here there are at this time in the Reform School eight boys and one girl, and two are at present inmates of the Additional Penitentiary, and the warden informs me that he has had as many as ten at one time in confinement in that institution. This matter demands such legislative action as may be found practicable toward preventing the State from becoming a harbor for the criminal youth of the sea-board cities.

The number of convictions for crime during the biennial period was 2,451. This is a diminution, as compared with the prior term, when they numbered 2,979, of 16½ per cent, and with the term ended September 30, 1877, of 25 per cent. The amount of fines imposed for the period was \$137,707.33, and the amount collected was \$34,959.42. The court expenses of the ninety-seven counties making returns amount to \$715,035.48, being \$38,443.92 less than for the former period, a reduction of about 5½ per cent. The average cost of each conviction during the period was \$291.81.

The number of registered pharmacists in the State is 2,241. There are in operation 457 mines, employing 6,176 hands. Coal is mined in twenty-six counties. There are in the poor-houses of the State, or receiving aid in counties without poor-houses, 1,304 persons.

The amount of property insured against fire for the year 1880 was over \$102,000,000, on which the premiums paid were \$1,279,245.07. The amount insured under life policies for the same year was over \$28,000,000, costing the

policy-holders in premiums paid for that year \$127,091.66.

The construction of railways is rapidly increasing in Iowa. At present there is a mileage in the State of fully five thousand five hundred, and there is in process of construction and partially completed fully one thousand miles more. All of the counties in the State save two have railway facilities, and these will be reached by lines now in process of construction early in the spring of 1882.

Among the lines under construction during the year were the following :

ROADS.	Miles.
Des Moines and St. Louis.....	70
Des Moines Northwestern.....	80
Des Moines Northern.....	43
Des Moines, Osceola and Southern.....	53
Des Moines and Fort Dodge.....	50
Chicago, Milwaukee and St. Paul.....	270
Chicago and Northwestern.....	180
Burlington, Cedar Rapids and Northern.....	60
Keokuk and St. Louis.....	60
Wabash and Chicago, Burlington and Quincy, from Humeaton to Shenandoah.....	80
Central of Iowa.....	60
Total.....	961

Drake University, to be located at Des Moines, has been incorporated. It will be under the control of the Christian denomination, and will absorb the former Oskaloosa College. It is intended for the education of both sexes. The total taxable property of the State amounts to \$418,481,472.50. Excluding Polk County, this is made up as follows: land and town-lots, \$295,016,392; personality, \$87,007,400; railroad property, \$25,356,073. The number and value of live-stock reported are as follows :

LIVE-STOCK.	Number.	Value.
Cattle.....	1,964,065	\$20,266,656
Horses.....	707,773	20,550,302
Mules.....	43,723	1,554,148
Sheep.....	436,306	543,295
Swine.....	2,224,651	4,404,610

The number of live-stock in 1875 was as follows :

Cattle.....	1,421,719
Horses.....	698,205
Mules.....	87,987
Sheep.....	724,204
Swine.....	3,086,161

Which shows a gain in every class of animals except sheep, which have been reduced 287,898 head.

The number of public schools is 11,244, of which 503 are graded; teachers, 21,776—6,546 male and 15,230 female; school-houses, 11,221, including 10,210 frame, 701 brick, 237 stone, and 73 log; volumes in district libraries, 26,757; value of school-houses, \$9,533,493; of apparatus, \$205,130. There are 137 private schools in Iowa, with 522 teachers, and 15,098 pupils. The total debt of the counties of the State amounts to \$2,745,678, of which the sum of \$2,592,222 is bonded. Of the counties, forty-one have no debt, fifty-two no bonded debt, and seventy no floating debt. The following figures show the progress of the State in manufactures :

YEARS.	Number of establishments.	Number of hands employed.	Amount of capital.	Amount of wages paid.	Amount of materials used.	Total products.
1850.....	532	1,707	\$1,292,875	\$475,016	\$2,356,581	\$3,351,783
1860.....	1,939	6,307	7,247,130	1,922,417	8,612,259	13,917,325
1870.....	6,566	25,032	22,420,182	6,893,292	27,682,696	46,634,322
1880.....	6,720	39,863	31,409,470	9,642,042	46,220,419	70,271,577

The prominent industries are: Agricultural implements, employing nearly 1,000 persons; brick and tile, over 2,500; flour and grist mill products, occupying nearly 3,000; lumber, almost 6,000; cheese and butter, in factories, nearly 1,000; slaughtering and packing, about 2,000 more, or some 15,000 persons in all.

According to the census of 1880, Iowa was the second among the States in the production of corn, yielding 276,093,295 bushels. Of wheat it produced 31,177,225 bushels. Of coal the product was 1,461,116 tons.

The following proposed constitutional amendment has excited considerable discussion: "No person shall manufacture for sale, or sell or keep for sale, as a beverage, any intoxicating liquors, including ale, wine, and beer."

It was adopted by the last Legislature, and must pass the next Legislature before it can be submitted to the people. It has been questioned whether it prohibits absolutely the manufacture for sale, or only the manufacture for sale as a beverage. The third annual jubilee of the temperance people of the State was held in July, when it was resolved to form a corporation to be called the State Prohibitory Amendment Association of Iowa, having for its objects "to procure the submission, adoption, and enforcement of the proposed amendment to the Constitution of Iowa prohibiting the manufacture and sale, within this State, of all intoxicating liquors as a beverage, including ale, wine, and beer."

The following resolutions were adopted:

The temperance people of Iowa, represented at this, our third annual jubilee, gratefully acknowledge the divine blessing upon the labors of the past, and hopefully proceed to plan and labor for a grander jubilee in the swiftly approaching future.

1. We rejoice in the general, permanent, and symmetrical development of the temperance work throughout the civilized world, and especially that, as in other things, so in this grand march of the nations toward prohibition, America, the "little child" in the family of nations, "shall lead them."

2. We rejoice that our younger sister among the Western States was the first to catch this spirit, and Kansas, under the leadership of her noble Governor, St. John, has been the first to respond to Maine, and has "prepared the way of the Lord," by kindling the first of the fires of constitutional prohibition upon the prairies of the West. And we rejoice the more that, when the whisky ring invoked the aid of the Supreme Court in quenching these fires, that honorable body found it in neither their heads nor their hearts to relieve the distress of those devotees of drunkenness and ruin.

3. We rejoice that the dominant political party in our State did, at its convention recently held at Des Moines, enthusiastically reaffirm its action favoring the submission of the amendment to a vote of the people, and did nominate as its standard-bearer a candidate pledged in advance in favor of such submission; and that another political party, honorable in its

membership and respectable in its numbers, has also sounded the trumpet of "prohibition" with no uncertain sound; while, as we have reason to feel assured, there are thousands of members of the only other political party in the State who are our peers in their hostility to the liquor-traffic, and will stand shoulder to shoulder with us at the polls in support of the proposed amendment.

4. We rejoice in the success that has crowned the labors of our "Woman's Christian Temperance Union," not only in instructing and guarding the young, but also in reforming drinking men, and throwing around them influences helpful and beneficent; and we hail them as honored conditors, worthy to be, and who ought to be, our equals in every word and work that tends to the world's advancement.

While thus rejoicing over the past, we recognize the magnitude of the work before us, and address ourselves thereto, believing it to be self-evident that, while distillers, brewers, liquor-dealers, saloon-keepers, gamblers, and keepers of dens of vice, oppose prohibition; all churches, all benevolent organizations, all who are interested in the education and elevation of society, and every individual engaged in any lawful and respectable business, ought to sustain prohibition by voice, vote, and uncompromising, invincible labor. Therefore,

Resolved, That we go from this convention determined and pledged to work and vote for such candidates for the office of Senator and Representative, and only such, as are clearly and unequivocally pledged to vote and work for the submission of the prohibitory amendment to a vote of the people, as proposed by the last General Assembly—holding that a refusal to submit to a vote of the people any proposed constitutional amendment, when demanded by so large a number of the electors of a State, savors of disloyalty to the principles of our government and to the rights of a free people.

Resolved, That, in furtherance of this purpose, we will push forward the work of organization for a thorough canvass of every county, township, ward, district, and individual in the State, seeking to impress the individual with the disaster that may fall upon his own home as the result of his single vote.

Resolved, That we highly esteem the valuable services of the press, both religious and secular, and in particular do we recognize the importance of well-sustained State temperance organs. We therefore commend "The Prohibitionist," published at the capital of the State, and the "Northwestern News," published at Davenport, to the special attention and patronage of all friends of temperance.

Resolved, That we commend the wisdom of the organization of a lecture bureau, under the control of a committee heretofore chosen by this body, and charged with the duty of supplying the field with competent and worthy workers, and at the same time guarding the public against impostors and incompetent pretenders.

Resolved, That regarding this as an irrepressible conflict, so long as the demon of the liquor-traffic lifts its head upon our soil, we go forth to this contest using every arm and munition heaven's arsenal affords, especially the gospel, the law, moral suasion, and scientific instruction. Confiding in these forces, aided and energized by the power of our God, we SHALL CONQUER.

A convention of brewers, called to concert measures to defeat the proposed amendment,

met January 19th, and adopted the following resolutions:

Whereas, The enemies of personal liberty are constantly increasing their efforts to ingrat upon the statute-book of this State more laws with reference to the manufacture and sale of all liquors, the provisions of which are notoriously unjust and tyrannical; and,

Whereas, An amendment to the Constitution of the State of Iowa, prohibiting the manufacture and sale of all liquors, including beer and wine, is now pending and will be brought upon its final passage before the next General Assembly; therefore, be it

Resolved, That in the face of the existing and coming dangers to our business and to the continual encroachments upon the rights and individual properties of the citizens of this Commonwealth, we deem it the highest duty of all persons engaged in the sale or manufacture of distilled or fermented liquors in this State to unite themselves for the purpose of defending liberty and property as guaranteed to us by the Constitution of the State of Iowa.

Resolved, That this convention proceed to organize a State Protective Association, embracing all re-

spectable persons engaged in the manufacture or sale of liquors.

Resolved, That the members of this association are hereby pledged to use all just and honorable means to secure the election of only such men to the Legislature as are opposed to all sumptuary and prohibitory laws, regardless of their party affiliations.

There are 120 breweries in the State, which in 1880 manufactured 252,000 barrels of beer, on which a tax of \$252,000 was paid. In these breweries more than 1,000 people are employed. The buildings, etc., represent a capital of \$2,840,000; machinery, apparatus, barrels, tubs, etc., an average value of \$1,500,000; all these figures aggregate a total of \$5,840,000. The wages for employes paid by the brewers amount to \$720,000.

According to the final returns of the census of 1880, the population, by counties, as compared with the returns of 1870, is as follows:

ISLAM, THE FUTURE OF. Mr. Wilfred S. Blunt, who spent several months in 1880 and 1881 in Jiddah, the sea-port of Mecca, and in Egypt and Syria, in the almost exclusive society of Mussulmans, for the purpose of observing the tendencies of Mohammedan thought and of studying the prospects for the future of the faith of Islam, gives an estimate as to the approximate census of the *Haj*, or pilgrimage to Mecca, and of the population of the Mohammedan world, which will be found in the table on the following page.

The numbers included in the four great sects are roughly given as follows:

1. The Sunnites, or Orthodox Mohammedans.....	145,000,000
2. The Shiites, or sect of Ali.....	15,000,000
3. The Abadites (Abadhiyeh).....	7,000,000
4. The Wahabites.....	8,000,000

All of these sects hold in common to the four fundamental beliefs of Islam, viz.: A belief in one true God, the creator and ordainer of all things; 2. A belief in a future life of reward and punishment; 3. A belief in a divine revelation imparted first to Adam, and renewed at intervals to Noah, to Abraham, to Moses, and to Jesus Christ, and, last of all, in its perfect form, to Mohammed—a revelation not of dogma only, but of practice, which has taught a universal rule of life for all mankind, in politics and legislation, as well as in doctrine and morals; and, 4. A belief in the Koran as the literal word of God, and in its inspired interpretation by the Prophet and his companions, preserved through tradition (Hadith). On other points, however, both of belief and practice,

TABLE OF THE MECCA PILGRIMAGE OF 1880.

NATIONALITY OF PILGRIMS.	Arriving by sea.	Arriving by land.	Mussulman population represented.
Ottoman subjects, including pilgrims from Syria and Irak, but not from Arabia proper.....	8,500	1,000	22,000,000
Egyptians.....	5,000	1,000	5,000,000
Mongrebbins, "people of the West" (Arabic-speaking Mussulmans from the Barbary States)	6,000	15,000,000
Arabs from Yemen.....	3,000	2,500,000
Arabs from Oman and Hadramaut.....	3,000	3,000,000
Arabs from Nejd, Assir, and Hasa, most of them Wahabites.....	5,000	4,000,000
Arabs from Hejaz, of whom perhaps ten thousand are Meccans.....	22,000	2,000,000
Negroes from Soodan.....	2,000	10,000,000(?)
Negroes from Zanzibar.....	1,000	1,500,000
Malibari from the Cape of Good Hope.....	150
Persians.....	6,000	2,500	8,000,000
Indians (British subjects).....	15,000	40,000,000
Malays, chiefly from Java, and Dutch subjects.....	12,000	30,000,000
Chinese.....	100	15,000,000
Mongols from the khanates (pilgrims included in the Ottoman <i>Hajj</i>).....	6,000,000
Lazis, Circassians, Tartars, etc. (Russian subjects, but included in the Ottoman <i>Hajj</i>).....	5,000,000
Independent Afghans and Beloochees (included in the Indian and Persian <i>Hajj</i>).....	3,000,000
Total of pilgrims present at Arafat.....	93,250		175,000,000
Total census of Islam.....			

they differ so widely that they must be considered as not only distinct from, but hostile to, each other; but not so irreconcilably so but that they all allow the rest to be distinctly within the pale of Islam, and will pray on occasion in each other's mosques, and kneel at the same shrines on pilgrimages.

The Sunnite, the orthodox and predominant sect of Islam, is subdivided into three considerable sects or schools of theology. The Hanefite sect, which is most largely represented in the pilgrimage, is the school to which the whole Osmanli race and the official classes, including the vice-regal courts of Egypt, Tripoli, and Tunis, and the courts of most of the Indian princes, are attached. It is the most conservative of the sects, and holds, according to the expositions of the Turkish Ulema, that the elaboration of new doctrine is absolutely closed, and that nothing can be added to or taken away from the already existing body of religious law. It has, however, become extremely lax as to practice.

The Malekite sect is "puritanical, fierce in its dogma, severe in its morals," and embraces the most fervent and most fanatical of the believers—men of ostensible and sincere piety, who "represent more nearly than any other Mussulmans the ancient earnestness of the Prophet's companions." It includes the Arabian and African tribes west of the Nile, and the Fellahin of the Delta. It also believes that inquiry has been closed, and change is impossible.

The Shafite sect is the most numerous, and embraces most of the Arabs out of Africa, the mass of the Mussulman population in India, at least where Arabian influence prevails, and the Malay Mohammedans. The Shafites appear disposed to widen rather than narrow the area of theology, are more humane than the other sects in their bearing toward infidels, "finding a common ground with them in the distinction between right and wrong," entertain ideas of a moral reformation, and appear to feel, without being willing to admit it, an indefinite desire

to see Islam united once more, even at the expense of some dogmatic concessions.

A fourth sect, the Hanballite, is included among the Sunnite bodies, but it now has only a few followers.

The Shiites number, outside of Persia, one million Irâki Arabs, five million in India, a few in Syria and Afghanistan, and isolated groups near Medina and in the large cities of the West. They refuse to tolerate the pretensions of any one now in authority to the title of Imam and Caliph, but hold it in abeyance, awaiting the advent of the Mohdy, or leader, who is to reunite Islam; and a belief is said to prevail among them that reform is at hand, and the leader may be expected at any moment and from any quarter. The religious bitterness between this division of Islam and the Sunnites has sensibly declined within the last fifty years.

The heretical sect of the Abadhiyeh are found only in Oman and Zanzibar. They simply reject all communion with the Sunnites, and deny all Khalifal history and authority later than the reign of Omar, as well as all the later traditions. Allied to them are the Zeidites of Yemen, whose sympathies lie on the side of liberality of opinion and reform in morals, but whose sole importance, their numbers being few, lies in their geographical proximity to Mecca.

The Wahabite movement has failed as an effort to regenerate the Mohammedan world politically, but the spirit of reform it awakened has remained, with effects that may be seen in the present unquiet attitude of expectation in Islam—its indirect result. In Arabia the zeal of the Wahabites has declined, and has given place to liberal ideas.

The Chinese Mohammedans are scattered and isolated, and can not well be placed in any of the general groups.

The relative numerical inferiority of the Ottoman Mohammedans is strikingly exhibited in the census-table. Ottoman thought appears in quite as subordinate a position when Islam is viewed in perspective. This was exemplified

in Mr. Blunt's observations at Jiddah, where every race and language and sect of Mohammedanism are represented in the throngs of pilgrims, and where the stranger hears discussed on every side the politics of the great world; where "the religion professed is that of a wider Islam than he has been accustomed to in Turkey or in India," and where his view of Islam becomes suddenly enlarged. And Mr. Blunt owns "to having come away with more than a gratified curiosity, and to having found new worlds of thought and life in an atmosphere I had fancied to be only of decay. I was astonished at the vigorous life of Islam, at its practical hopes and fears in this modern nineteenth century, and, above all, at its reality as a moral force."

Nevertheless, the Sultan assumes to be Caliph of the whole Mohammedan world, and his title is tacitly conceded by the mass of the Sunnite sect. According to the orthodox doctrine, a caliph is essential as the *ex-officio* head of the religious polity of Islam, and as the successor of the Prophet. Whoever holds the office is theoretically king over all Islam, and its supreme religious authority in spiritual matters; although, practically, his temporal jurisdiction can only extend to such lands as he can hold by arms; and the Sultan has not for many centuries exercised any direct authority in spiritual matters. The Sultan derives his title as Caliph from Selim I, who, having captured and beheaded the reigning Mameluke Sultan of Egypt, in 1517, acquired from a descendant of the house of Abbas, whom he found living as titular Caliph at Cairo, a cession of his rights. One of Selim's successors obtained from the Ulama a decision that his title was valid, because he held it—1. By the right of the sword—until a claimant with a better title should appear; 2. By election, the form of which is still kept up; 3. By nomination, derived from the original cession to Selim; 4. By virtue of the guardianship he exercises over the two shrines (at Mecca and Medina); and, 5. By virtue of his possessing the *Amanat*, or sacred relics. These claims, however, do not rule without being passively disputed. The Emperor of Morocco claims himself to be the Caliph, as the representative of that ancient schism of Cordova which took place in the second century; but the limited extent of his dominion and his remoteness from the center of Mohammedanism prevent his claim from being effectively heard. Of more importance are the claims of the princes of the house of Koreysh, at Mecca, which are supported by the fact of descent from Ali Ibn Abutaleb, the fourth Caliph, and through his wife, Fatmeh, from Mohammed himself, and are centered in the Grand Shereef of Mecca, as the ostensible head of the house. The Sultan does not venture to dispute the claim, but buys it off, and has established thereby one of the strongest facts which he is able to use in support of his own exercise of the powers of Caliph. The Shereef of Mecca has no political

strength, and needs the support of some stronger power to defend him against the hostile Arabian tribes of Nejd, and to protect the pilgrim routes to Mecca, on the freedom of which, and the consequent continued coming of pilgrims, his prosperity depends. The Sultan affords the required protection, and, in addition, transmits annually to the Shereef the revenues of the Vacouf within the Turkish Empire, which are supposed to amount to nearly half a million pounds sterling. In return he is acknowledged as sovereign, and enjoys undisturbed power and patronage, except in Mecca itself; and also holds the power of removal and nomination of the Shereef, provided he always selects that officer from the shereefal family. "Either hates and despises the other, the patron and the patronized; and, save that their union is a necessity, it would long ago have, by mutual consent, been dissolved."

The internal movements of recent years in Turkey and in the whole Mohammedan world have turned very largely upon the position of the house of Othman in relation to the caliphate. Sultan Abdul-Aziz, in the early part of his reign, eagerly took up with a suggestion that his strength and Turkish influence might be greatly increased by putting the spiritual authority of the Sultan as Caliph more prominently forward. The Ulama readily agreed to the scheme, and enthusiastically entered into the prosecution of it. Missionaries were sent out to propagate in all the Mohammedan states the doctrine of the Sultan's spiritual leadership. The party of "Young Turkey," with Midhat Pasha, accepted the central idea of the plan, and labored to secure its realization in a modified form, the prominent feature of which was the separation of the political power from the spiritual functions of the Caliph. With this object, they sought to establish a constitutional parliamentary system of government, in which a ministry should assume the charge of temporal affairs and be responsible for their management, leaving the Sultan, still the nominal head of the state, to be occupied pre-eminently with his ecclesiastical duties. Abdul-Aziz proved to be incompetent to carry out this enterprise on which he had apparently started well, became an impediment to it, and was deposed. Abdul-Hamid was better fitted to the purposes of the Ulama, and seemed more capable of carrying them out, but, before he was able to accomplish anything in that direction, the prestige of Turkey as a power was nearly destroyed by its defeat in war, and a new difficulty of the most formidable character had to be met. Abdul-Hamid and those who are co-operating with him have not, however, given up their scheme, but are still using every effort to promote it.

In the mean time a new scheme, in which Midhat Pasha is credited with being a prominent mover, has been started among the Arabians and the Mohammedans who are not friendly to Turkish rule, for the erection of a

caliphate distinct from and independent of the Ottoman sultanate. This was the central idea of the agitation which prevailed in Syria while Midhat Pasha was governor there; it is the practical motive to which life is given by the expectancy shared by all the Arabs of the speedy coming of a Mohdy or guide who is to appear as a chief to unite and purify Islam and restore its prestige; and it is a paramount object of the rising of the tribes which is threatened in North Africa, and which is believed to be directed as much against Turkish authority as against European aggression.

A correspondent of the London "Times," who appears to have gained a fairly intelligible view of the intrigues of the Ottoman court, has written to that journal from Constantinople, January 12, 1882, an account of the consultations that are going on within the palace of the Sultan relative to the declaration of the Ottoman caliphate. At the Sublime Porte all is still outwardly European in its aspect; but at the imperial palace Asiatic methods and Pan-Islamic thought prevail, and it is here that the radical transformation which Turkish statesmanship has undergone during the present Sultan's reign must be studied. The object of raising Turkey to an honorable place among the European powers, and making Constantinople one of the great European capitals, which had guided Turkish diplomacy for the fifty years previous to the beginning of the present reign, has been exchanged for that of making the Ottoman Empire the nucleus of a new universal caliphate, and Constantinople the political center of the Mohammedan world; and the Sultan draws his inspiration from men who are in sympathy with this ambition, and seeks European advice only so far as he can use it to assist him in accomplishing its object. According to this writer, whose view does not otherwise differ from those of other observers, the project of a united Islam under the Ottoman caliphs dates from the present reign; and the patriotism of Abdul-Aziz and the party of Young Turkey was of a Turkish, not of a Mohammedan, kind. As long as it appeared possible or probable that Turkey would continue to be able to find a patron among the Christian powers, the Turks were willing to be satisfied to have affairs go on in the old traditional way; and it was not till the Russian Government had displayed its real policy in the Treaty of San Stefano, and the Congress of Berlin had shown that Turkey had no longer any Christian protector, that the Turks began to feel that they had nothing to hope from Christendom, and the ground was prepared for Pan-Islamic theories. Under the indignation that was excited against the Sultan and his dynasty for the destruction of Turkish prestige under their rule, a plan was formed for the elevation to the caliphate of the Shereef of Mecca. In order to forestall suspicion, the scheme was communicated to the Sultan in a disguised form, in which its real aim was concealed be-

neath a pretense of working for an Islamic union under the sovereignty of the Sultan. Abdul-Hamid, whose capacity is recognized and appreciated by all observers of Turkish affairs, detected the real nature of the scheme, and, dexterously checkmating his enemies, turned it to his own advantage by putting himself at the head of it. He enlisted, to aid him in carrying it out, Sheik Zaffer, a Tripolitan, who had long been his spiritual director; Munif Effendi, now Munif Pasha, who had been Minister of Public Instruction; Abdul Huda, a young sheik of an old Aleppine Arab family; Ghazi Osman, the hero of Plevna; and Behram Aga, the chief eunuch. Schemes for reforming and renovating the native institutions in accordance with certain old principles were undertaken and abandoned, after a short trial under the administration of Khairredin Pasha. Plans for extending the influence of the country to foreign populations were pressed more vigorously and persistently. Personages of distinction in all parts of the Mussulman world were encouraged to visit Constantinople, and received there a liberal hospitality and marked consideration. The agents who were sent abroad in the interest of the scheme were received with favor in the most distant countries. The Mussulmans of India were well impressed with it, and a special organ in the Urdu language, called the "Peik Islam," was founded at Constantinople to keep them informed respecting it. In Afghanistan the propaganda was encouraged by England; and the special envoy of the Sultan, who was sent to Cabool to warn Shere Ali against too intimate relations with Russia, told, on his return to Constantinople, how the people had crowded around him in order to have the honor of touching the garment of an envoy of the Caliph. The scheme was resisted for a time by the Shereef Hussein of Mecca and the Khedive of Egypt, but these princes were put out of the way, the former by assassination, the latter by deposition. Since then the idea of the caliphate has made rapid progress on the eastern coast of the Red Sea and in the valley of the Nile. The dispositions of the people of the land which formerly composed the Western Caliphate were at first adverse, but were changed by the French invasion of Tunis, which "aroused the dormant hatred of the infidel, and transformed from a harmless theory into a very dangerous reality the Sultan's caliphal pretensions with regard to Northern Africa." The danger of these pretensions, in the view of the correspondent of the "Times," does not lie in any probability of the Sultan being able to create a vast Pan-Islamic empire, but in the possibility that the Mussulmans who live beyond the limits of the Ottoman Empire, and who owe allegiance to sovereigns other than the Sultan, should be brought under the influence of Constantinople, and that this influence should be used at critical moments to produce popular sedition and insurrection—a possibility that has

already become real in Tunis and Southern Algeria.

Both these movements—the one that aims to extend and develop the spiritual authority of the Sultan, and that which aspires to the erection of an independent caliphate—contemplate a union of the Mohammedan world, and may equally be called Pan-Islamic: the question as to which party will prevail must be one of physical force, for the Sultan's title to the caliphate avowedly rests solely upon his ability to maintain it thus. The parties opposed to the Sultan labor under the disadvantage of not being united under any single leader, and of having their forces scattered. The Shereef of Morocco advances a claim to the title; and a chief has arisen in Tripoli who claims to be the expected leader of the Mohammedan prophecies, and promises to reveal himself openly to the world on the 12th of November, 1882. This leader, who is called El Mehdi, is the sacrosanct head of the Sennoussia community, which is said to have hundreds of monasteries in North Africa, and even in Arabia and Syria, and to be obeyed by Mohammedan tribes of the desert whose very names are unknown to Europeans. The prophecy of which he aspires to accomplish the fulfillment is believed to have been drawn up by Sennoussi, the Algerine Moor—a shereef or descendant of the Prophet—who founded in 1850 the great organization which now disputes with the Turks the sovereignty of Southern Tripoli, and which supplies the material resources for the resistance offered by the Tunisian tribes to the Turkish invasion. It has been circulated for several years through the Moorish-Musulman world, and predicts that “on the 1st of the month of Mohassan, in the year 1300 (November 12, 1882), will appear the El Mohdy, or Messiah. He will be exactly forty years of age, and of noble bearing. One arm will be longer than the other; his father's name will be Mohammed, his mother's Fatima, and he will be hidden for a time prior to his manifestation.” The Tripolitan El Mehdi has the physical peculiarity referred to, his right arm reaching to his knee, and he has for four years been hidden from all eyes in a religious retreat. Another chief has risen in Soodan. The Khedive of Egypt is believed to be willing to aspire to the position of a leader if an opportunity should be offered him; and the followers of Colonel Arabi, in the same country, are said to be earnestly watching for the deliverer. The family of the Shereef of Mecca have the vast advantage over any other possible competitors to the supreme title of Islam that they are of the acknowledged blood of that tribe of Koreysh which Mohammed himself designated as his heirs, and “are surrounded with a halo of religious prestige which would make their acquisition of the supreme temporal title appear natural to all but the races who have been in subjection to the Ottomans.”

The Sultan, who is said to acknowledge the

superior rank of the shereefs on ceremonial occasions, is well aware of this fact, and has therefore always taken particular pains, by subsidies, by fostering family feuds, by personal selection of the shereefs, and by influence over them personally, to keep them in subordination to him. The assassination of the Shereef El Hussein Ibn Aoun, on the 14th of March, 1880, although nothing is positively known on the subject, is believed to have been inspired by political motives. The murdered Shereef was a man of liberal views, friendly toward the European powers, and so popular among the Arabs of Ilejaz as to excite the jealousy of the Turkish Government. The Shereef who took his place, Abdul Mutaleb, was of a rival branch of the family, of Wahabite affiliations, and a fierce fanatic, and had twice before been shereef and twice deposed. He is more than ninety years old, and it has been mentioned as a curious coincidence that his name is the same which the traditions give to the vicegerent of the Mohdy who is to appear in 1882, and overthrow the Turkish power and the caliphate of Constantinople. It is believed by many Mussulmans that an Arabian caliphate, deriving an undoubted title direct from the founder of the faith, would go far toward reconciling the sects with orthodox Islam, and restoring unity among them. The Arabians would be able to give their caliphate a strong and effective support; for they are described as being an active, vigorous, and liberal-minded people; their settled estates in the oases are well kept and thrifty; and the political princes in the states of the peninsula have given their people a security of government that is unknown under Turkish jurisdiction.

Opposite opinions prevail on the question whether the Mohammedan religion is capable of being reformed and given a development in accordance with the present tendencies of civilized nations. The Rev. Edward Sell, who has embodied the results of fifteen years' study among the Mussulmans of India in his “Faith of Islam,” has shown that the Koran is not the sole standard of Moslem doctrine and practice, but that it is supplemented by three other standards of nearly equal authority. The Koran itself is held to be unique among sacred books, and pre-eminent over them all, because every word of it was composed in heaven and dictated to Mohammed, word by word, in the Arabic language, and in an audible voice, while the other divine books were received by the prophets who uttered them only in the form of ideas. Thus, it can not be altered in the slightest degree. It is, however, supplemented and explained by the “Sunnat,” which consists of the commands given by the Prophet outside of the Koran, and the examples set by him, including his “recorded sayings, doings, and silences” on certain subjects, which, though technically not as sacred as the Koran, are quite as binding, and are in many cases the authoritative interpretation of doubtful pas-

sages in the Koran. A third standard is the "Ijma," or consensus of the leading Mohammedan theologians on all disputed points of faith and practice, which is based on the systems of jurisprudence established by the four great orthodox Imauns, Abn Hanifa, Ibn Málík, As-Shafii, and Ibn Hanbal. These decisions are absolutely binding on all true believers, and it has been an article of faith with men of the Turkish schools since the eleventh century of the Christian era, that all further discussion or interpretation on these points is closed. The fourth standard, "Qias," is provided in the system of analogical reasoning practiced by the doctors of the Mohammedan law. The Turkish school hold that this method of interpretation also is closed by the rule that nothing can be drawn out by it that is contradictory to or does not coincide with what is determined by the other three standards. Another school, represented by the Turkish liberals and the Arabian reformers, has arisen, who believe that this method can be used so as to afford a system under which the principles of Islam may be adapted to any exigency that may arise. They maintain that Mohammedanism in its institution, and for many centuries after its birth, was eminently a rationalistic creed, and that its first spiritual triumphs were obtained through reason as well as through faith. The rules then established, embodied in custom and law, served as a sufficient guide while Islam was confined to Arabia, but had to be elaborated by further reasoning, as was done by the four great Imauns, as soon as it went out from Arabia, and had to meet new conditions. By the same principle, a new elaboration of reasoning is now called for, since the faith has to face other new and unprecedented conditions, and will be in place whenever a new leader may appear with sufficient authority to direct it and give it approval. These views, and the expectation of the new leader, or Mohdy, prevail most wherever Arab thought is the strongest, and it is there, says Mr. Blunt, "that we now find the surest symptoms of returning mental life. Modern Arabia, wherever she has come in contact with what we call the civilization of the world, has shown herself ready and able to look it in the face; and she is now setting herself seriously to solve the problem of her own position, and that of her creed toward it. . . . Where her intelligence has remained unclouded by the sense of political wrong, she has proved herself capable not only of understanding the better thought of Europe, but of assimilating with it as akin to her own." Thus at Cairo, the Arabian ulemas are rapidly assimilating to their own the higher principles of European thought, and adopting some of the better features of European morality. In Oman and Peninsular Arabia generally there is a real feeling of cordiality between the Mohammedan and his Christian guest. The abolition of slavery in Zanzibar was a concession to European opinion as much as to Euro-

pean force; "and a moral sympathy is acknowledged between a Moslem and a Christian state which has its base in a common sense of right and justice." The same humane feeling is known to exist in Nejd; it is believed to exist in Yemen; in Hejaz, the most fanatical of Mohammedan states, Mr. Blunt found "all that was truly Arabian in the population as truly liberal"; and the late Shereef of Mecca was ready, when he was assassinated, to open his country to European intercourse, and abolish the slave-trade. The best thinkers of Islam, who seek to promote these views, are simply waiting a legal authority to change, and are seeking means to call such an authority out and put it in a position to act.

The political prospects of Islam are less promising than are the forecasts of its religious zeal and spiritual supremacy. Its principal independent states are hard pressed by hostile Christian nations. The Ottoman power is threatened in Europe and Armenia, and Turkish statesmen themselves can not exclude the belief that it is only a question of a short time when the Sultan will have to retire from those outlying provinces, and fall back upon the Turkish populations of Asia Minor and the Arabian tribes. Persia, weak, disorganized, and decaying, is constantly threatened by Russia, while the Turcomans of the desert and the tribes beyond the Oxus and the Jaxartes are submitting to the same great power. Afghanistan, the last of the great independent klanates, is overshadowed by Russia and England. The Mediterranean states of Africa are either already under European influence or objects of the jealous greed of rival powers. In India, the largest population of Mohammedans in any single country is under the control of the English Government; and another large population of Malay Mohammedans is restrained by Dutch rule. Two desperate attempts of Mohammedans within the Chinese Empire to recover independence have been suppressed, in Yunnan and Kashgar, with bloody massacres. Mohammedanism holds its own, however, in the interior of Asiatic Turkey and Arabia, and is making a rapid spiritual growth in Southeastern Asia, where it is believed that it, rather than Christianity, is destined to supplant Buddhism, and in the interior of Africa, where it has the advantage in the rivalry with Christianity, and appears destined to be the religion of the future. Whether it will be able to maintain its spiritual ascendancy and growth without a strong center of temporal power, or whether it will again be able to establish such a power as shall command the respect of the world, and maintain its influence among the populations of the faith, are questions to which the present condition of affairs does not afford the data for an intelligent answer.

ITALY, a kingdom of Southern Europe. King, Humbert I, born March 14, 1844. He succeeded his father, Victor Emanuel II, Janu-

ary 9, 1878, and married, April 22, 1868, Margaretha, daughter of Prince Ferdinand of Savoy, Duke of Genoa. Heir-apparent, Victor Emanuel, Prince of Naples, born November 11, 1869.

The area of Italy is 296,322·91 square kilometres, or 114,415 square miles. The following table gives the area of the larger territorial divisions (*compartimenti*), with the population at the close of 1879:

TERRITORIAL DIVISIONS.	Square kilometres.	Population in 1879.
Piedmont.....	29,286·20	3,107,026
Liguria.....	5,324·20	894,244
Lombardy.....	23,526·81	3,684,594
Venetia.....	23,468·73	2,841,735
Emilia.....	20,515·09	2,209,917
Umbria.....	9,638·46	574,573
The Marches.....	9,708·70	953,258
Tuscany.....	24,052·99	2,236,606
Rome.....	11,917·13	849,546
The Abruzzi and Molise.....	17,290·11	1,341,457
Campania.....	17,978·00	2,594,187
Apulia.....	22,115·07	1,536,465
Basilicata.....	10,675·97	536,944
Calabria.....	17,257·13	1,271,622
Sicily.....	29,241·27	2,832,851
Sardinia.....	24,342·05	671,772
Total.....	296,322·91	28,437,091

Italy acquired its first colony in 1881, by the acquisition of Assab Bay, on the Red Sea, with a population of about 1,000.

The movement of population for 1879 was as follows:

Marriages.....	213,096
Births { inclusive of still-births. }	1,097,778
Deaths {	870,307
Still-births.....	33,625
Surplus of births.....	227,471

The number of emigrants for 1880 was 119,901.

The principal countries of destination were as follows:

Austria.....	43,172
Austro-Hungary.....	20,493
Switzerland.....	13,074
German Empire.....	4,277
Greece, Turkey, Servia, and Roumania.....	4,398
Other European countries.....	2,019
Algeria.....	1,390
Egypt.....	753
Tunis.....	260
Brazil, Venezuela, Mexico, Central America, and United States of Colombia.....	12,053
La Plata states.....	15,271
United States and Canada.....	5,756
Other countries.....	159

The population of the principal cities, on January 1, 1879, was as follows, according to the calculations of the Bureau of Vital Statistics:

Naples.....	458,614	Florence (Jan. 1, 1880) 145,207
Milan.....	292,524	Venice..... 131,276
Rome.....	289,321	Messina..... 120,709
Palermo.....	236,579	Bologna..... 111,933
Genoa.....	231,636	Leghorn..... 97,410
	175,006	Catania..... 90,996

The Italian ministry consisted, at the close of 1881, of the following members: President of the Council and Minister of the Interior, A. Depretis; Minister of Foreign Affairs, P. S. Mancini; Minister of Public Instruction, G. Baccelli; Minister of Finance and of the Treas-

ury, A. Magliani; Minister of War, General E. Ferrero; Minister of the Navy, Vice-Admiral F. Acton; Minister of Grace, Justice, and Worship, J. Zanardelli; Minister of Public Works, A. Baccarini; Minister of Agriculture and Commerce, D. Berti.

The actual receipts and disbursements of the kingdom, from 1876 to 1879, were as follows (in lire, one lira=19·3 cents):

YEARS.	Receipts.	Disbursements.	Deficit (D) or surplus (S.).
1876.....	1,429,423,758	1,436,837,413	D. 7,413,655
1877.....	1,491,778,495	1,480,750,305	S. 11,028,190
1878.....	1,443,035,277	1,430,822,500	S. 12,212,777
1879.....	1,470,992,506	1,428,478,752	S. 42,513,754

In the budget for 1881 the revenue was estimated as follows:

REVENUE.	Lire.
Ordinary.....	1,293,130,897
Extraordinary.....	141,891,460
Total.....	1,434,522,357

Some of the principal sources of the ordinary revenue were as follows:

REVENUE.	Lire.
Direct taxes.....	367,188,646
Grist-tax.....	45,500,000
Customs.....	188,000,000
Salt and tobacco monopoly.....	191,500,000
Posts, telegraphs, and public institutions.....	99,598,577

The expenditure was estimated as follows:

DEPARTMENTS.	Ordinary expenditures.	Extraordinary expenditures.
Ministry of the Treasury.....	716,568,417	19,690,820
“ of Finance.....	130,908,794	616,695
“ of Justice and Worship.....	28,180,122	114,700
“ of Foreign Affairs.....	6,227,461	116,300
“ of Public Instruction.....	27,540,726	1,041,197
“ of Interior.....	56,520,069	2,224,396
“ of Public Works.....	61,226,032	105,289,880
“ of War.....	192,509,760	21,926,667
“ of the Navy.....	43,400,661	2,734,000
“ of Agriculture.....	8,512,613	1,162,678
Total.....	1,271,844,655	154,867,338
Total expenditure.....	1,426,711,988	
Total revenue.....	1,434,522,357	
Expected surplus.....		7,810,869

The interest and amortization of the public debt in 1880 were as follows (in lire):

DEBT.	Interest.	Amortization.
1. Consolidated debt.....	396,479,400
2. Permanent rente of the Holy See.....	8,225,000	2,048,550
3. Funded debt inscribed in the Libro Grande.....	35,885,635	1,897,952
4. Miscellaneous debt.....	44,091,360
5. Floating debt.....	14,015,876
Total.....	493,697,271	3,946,502

The strength of the Italian army, on September 30, 1880, was as follows:

Infantry of the line.....	254,181
Military districts.....	275,386
Companies of the Alps.....	12,176
Bersaglieri.....	42,827
Cavalry.....	33,951

Brought forward.....	613,471
Artillery.....	59,807
Engineers.....	13,984
Gendarmes.....	17,591
Military schools.....	3,210
Sanitary companies.....	4,524
Veterans.....	273
Stud depots.....	851
Disciplinary companies.....	1,383
Penal institutions.....	2,102
Officers in service.....	11,930
Other officers.....	2,421

1. Standing army.....	736,502
2. Provincial militia.....	281,867
3. Officers of reserve.....	3,133
4. Territorial militia.....	697,426

Total..... 1,718,938

The navy was composed as follows on January 1, 1880:

VESSELS.	No.	Guns.	Tons.	Horse-power.
MEN-OF-WAR:				
Ironclads.....	17	242	101,651	12,830
Screw-steamers.....	15	143	23,590	4,470
Side-wheel steamers.....	6	41	7,960	2,050
Total men-of-war.....	88	426	133,211	19,350
TRANSPORTS:				
Screw-steamers.....	20	49	17,969	2,894
Side-wheel steamers.....	9	12	2,244	725
Total transports.....	29	52	20,213	3,619
Total.....	67	473	153,424	22,969

The commercial value of the imports in 1880 amounted to 1,224,800,000 lire, and of the exports to 1,130,600,000 lire. The value of the

principal articles of import and export were as follows (in lire):

CLASSES OF GOODS.	Imports.	Exports.
Grain.....	163,400,000	76,200,000
Malt and other liquors.....	17,200,000	51,000,000
Colonial produce.....	65,000,000	4,700,000
Tobacco and cigars.....	17,300,000
Seeds and fruits.....	24,400,000	6,200,000
Animals and animal provisions.....	79,300,000	182,900,000
1. Articles of food.....	366,600,000	296,000,000
Fuel.....	60,700,000	4,500,000
Minerals and ore.....	11,300,000	80,100,000
Raw metals.....	57,900,000	1,400,000
Hair, hides, and leather.....	44,200,000	25,100,000
Spinning material.....	192,500,000	346,000,000
Wood and timber.....	32,000,000	15,000,000
2. Raw materials.....	393,600,000	422,100,000
Pottery and glassware.....	11,800,000	10,000,000
Metal manufactures.....	7,700,000	300,000
Machines and vessels.....	33,600,000	1,900,000
Leather, etc.....	1,700,000	4,900,000
Yarn.....	42,400,000	22,200,000
Cordage and twine, woven goods and clothing.....	142,000,000	24,900,000
Paper.....	8,000,000	6,000,000
Wood-carvings.....	7,600,000	37,400,000
Objects of art.....	32,900,000	17,200,000
Manuscripts, articles for printing.....	3,300,000	1,500,000
3. Manufactured goods.....	256,000,000	150,300,000
4. Miscellaneous goods.....	134,100,000	203,300,000
5. Precious metals.....	39,500,000	25,900,000
Total.....	1,224,800,000	1,130,600,000

The movement of shipping in 1879 is exhibited by the following table:

VOYAGES.	TOTAL.		LADEN.		STEAMERS.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
ENTERED.						
1. Long voyage:						
Italian.....	10,224	1,612,745	8,161	1,408,702	1,095	774,555
Foreign.....	6,009	2,764,574	5,172	2,544,465	3,025	2,243,325
Total long voyage.....	16,233	4,377,619	13,333	3,953,167	4,120	3,017,880
2. Short voyage:						
Italian.....	56,464	6,203,211	44,206	5,636,496	10,692	4,623,714
Foreign.....	3,528	2,306,564	2,563	2,061,872	2,574	2,178,070
Total short voyage.....	59,992	8,514,765	47,074	7,698,368	13,566	6,801,784
CLEARED.						
1. Long voyage.....	16,743	4,764,912	12,130	3,515,333	4,513	3,278,137
2. Short voyage.....	59,450	8,171,754	45,865	7,378,576	13,165	6,529,168
Total.....	76,193	12,936,666	57,995	10,891,909	17,673	9,807,305

The aggregate length of railroads in operation was on December 31, 1879, 8,289 kilometres. The number of postal stations at the close of 1879 was 3,272; of letters and postal-cards forwarded, 163,477,173; of printed matter, 143,729,598; of money orders, 3,903,960. The aggregate length of telegraph lines at the end of 1879 was 25,533 kilometres; of wires, 84,801 kilometres, exclusive of 175 kilometres of submarine cables. The number of offices was 1,494, exclusive of those belonging to railroads and other companies (737). The total number of dispatches in 1879 was 5,502,581.

Every Italian statesman must take account of the possibility of a foreign war. The geograph-

ical situation and physical conditions of Italy have rendered her soil in all ages a temptation and a prey to conquerors. The *imperium in imperio* of the Roman Catholic Church awaits the undoing of the newly founded state. It exercises a moral sway over the hearts and minds of millions in every country, which may, in the course of events, give it an influence over the springs of political and international action, and is a source of constant apprehension. This is the more real, owing to the recent reconstruction of Italian existence and the circumstances under which it was attained. Fearful lest a fatal blow should be struck at the unified kingdom through the Church or in some fresh dis-

turbance of the European equilibrium, the Italian Government has burdened itself with the most grievously oppressive military establishment in Europe. This has hindered the political development of the nation and the natural tendencies to improvement. The dominant party is composed of men who were extremely radical in their opinions, and passed, many of them, for republicans when in opposition. Yet these radicals in office are more timidly conservative than the party of the Right whom they succeeded. They have with difficulty been able to unite on reforms which the most moderate among them considered imperative before they came into power. Much of their attention is given to watching the European horizon and coquetting with other powers for an advantageous alliance in the next European convulsion. The exotic military system under which the people groan is fostered and constantly enlarged with the approval of all parties. The party in power has checked all natural leanings to national friendships or antipathies, and has kept the country in absolute isolation, waiting to make the best bargain with the monster armaments which are willingly supported in the midst of profound peace by this overtaxed and peace-loving people. This attitude was in its relations to internal politics a natural and logical one for the group of men who guide the helm of state to assume, for they occupy a neutral ground in politics, and balance themselves between the republican tendencies which are derived from France and the monarchic ideas which predominate in Central Europe. The connection of the house of Savoy with the achievement of Italian union gives the reigning dynasty the strongest title to loyalty enjoyed by any monarchs in Europe, and the circumstances under which their kingdom was founded prescribe for this line of sovereigns a policy of liberality toward democratic tendencies from which they have not yet shown any tendency to depart. The Left, which has been in power since 1876, numbers among its leaders men who have always passed for republicans. The party is composed of the democratic followers of Ratazzi. Yet they are as earnest in their protestations of loyalty to the monarchy as their opponents, and do not differ from them in principles. Probably a large majority of the Italian people are republicans in theory, but the Red Republicans and Socialists are fewer in number than in any other country, and even they recognize that the strength of Italy is in the constitutional monarchy under the present conditions. The latter class, in other countries the uncompromising denounciators of militarism and international warfare, in Italy clamor for the conquest of the "unredeemed" provinces, or insult the Church, impatient to provoke the conflict in which Italy is to prove the prowess of her arms and acquire the prestige of victory. Military prestige is felt by all parties to be the chief need of Italy, and those who hold the

most advanced and radical views are the most impatient to attain it, deeming that their ideas will not have scope for development until Italians have won in battle the liberty to manage their affairs as they will without danger of foreign interference. The Conservative party would have proceeded with the national armament and defenses more rapidly than the Left has done, and would have pursued a more aggressive policy and taken an active part in the European combinations. The cautious and temporizing ministerial party have been driven by the gust of popular indignation which followed the French intervention in Tunis, if they would not otherwise have drifted, toward the alliance approved by the Opposition. The effect of the injury dealt to Italian prestige in Tunis by France has been to obliterate the sentiments of revenge toward Austria and remove the danger to the country of becoming inflamed and plunged into a war on account of *Italia irredenta*.^{*} The aggressive aspirations which are now turned toward France are far less strong and dangerous, and are really a guarantee of peace, as they constitute a check to the revengeful designs which France may entertain toward Germany. The party in power may be expected to continue to keep out of entangling alliances and to pursue a pacific policy, and at the same time to strengthen the fortifications and increase the army and navy, for the sake of improving the security and prestige of the nation. The internal policy of the country has been conducted with the same shrewd and politic circumspection which has governed the external relations. The cautious leaders who have been kept at the head of the Radical party since it came into power in 1876 took a stand between the parties. The reforms which the Left undertook to accomplish have been brought forward tardily and in a greatly modified shape. The large majority of the party has been a source of weakness. The internal divisions and personal rivalries have led to ceaseless Cabinet crises. But these divisions have been between the abler and more representative members of the party, and the moderate men who, for reasons of policy, and owing to the King's preferences and other outside influences, have been intrusted with the direction of affairs. For these reasons the Progressist party has succeeded in accomplishing very tardily and only partially the legislation which was promised when their rule began.

The revision of the Italian Constitution, although it is acknowledged on all hands to be a very defective instrument, is not proposed by either of the great parties, because it contains no provision for such revision or amendment. The electoral law is a legislative statute, and the principal project in the programme of the Progressists, but which has been long delayed, was the extension of the franchise. Universal suffrage has long been advocated by

^{*} See "Annual Cyclopaedia" for 1879.

leaders of the dominant party, but the bill which was finally brought in during the session of 1881, and carried after a long discussion, still retains important limitations. Another favorite project of the party has been the revision of the penal code, with the object of mitigating the harsher penalties and ultimately abolishing the death-sentence.

The fiscal system of Italy, national and local, is full of anomalies. The antiquated and vicious methods of taxation retard material progress, and bear with crushing force upon the half-starved tillers of the most fertile valleys in Europe. But the mischievous taxes are not removed, though new ones are added, because the maintenance of overgrown armaments, which are not yet considered sufficient for the defense of Italy, and the proper assertion of her position as one of the six great powers, will not allow any source of revenue to be disturbed. The *octroi* duties, or taxes on produce brought into the towns, are still in full force. The house-tax in some of the towns, as in half-deserted Florence, amounts to nearly fifty per cent of the rental. The legacy duty is collected not only from the immediate heirs and legatees upon their succession, but is exacted for reversionary interests which fall due in the indefinite future. The tobacco-tax presses heavily on an article of universal consumption, and falls with special severity upon the poorer classes. The salt monopoly is a still more indefensible source of revenue. The public lottery is an immoral mode of taxation, and its influence unquestionably pernicious. The customs duties are excessively high, and revenue considerations prevent their being adjusted so as to judiciously protect home industries without unnecessarily hampering foreign trade. The port charges and navigation laws are a further discouragement to commerce, and have had the effect of diminishing navigation and reducing the Italian commercial marine.

Two popular financial measures were proposed by the Government party when in opposition. These were the abolition of the obnoxious grist-tax and the return to specie payments. Favored by abundant harvests and improving prosperity, both of the promised reforms have at length, though tardily, been initiated. The act for the removal of the grist-tax was passed in the session of 1880. The opponents of the measure prophesied that the public finances would be seriously crippled, but the revenue of 1881 was larger than the most sanguine supporters of the bill anticipated.

As soon as the Cabinet crisis was composed, the Legislature entered on the discussion of the electoral reform act. Under the old law suffrage was limited to those who paid at least forty francs direct taxes annually and to members of the learned professions. Universal suffrage has found many advocates in Italy; yet when an amendment in that sense was proposed, only 39 votes were given for it to 314 against, and Crispi's proposal to allow all to

vote who could write the names of their candidates, was lost by a heavy majority. The property limitation of the new law is the payment of nineteen francs eighty centimes of annual taxes. The bill passed the Chamber June 29th, and was still pending before the Legislature at the end of the year. It passed the Senate, much altered by amendments, December 20th. The substitution of the *scrutin de liste*,* or collective tickets, for the method of voting by separate districts for the representatives in the Legislature, was one of the elective reforms proposed by the Government. It was presented in a separate bill, and, though pressed by the ministry, the Chamber postponed the measure, and it could not be brought to a vote before the adjournment in July. Notwithstanding the dissensions among the majority, the two Cabinet crises, and the difficulties of the situation at home and abroad, the session was an unusually fruitful one. Besides the election reform bill, and the bill for the retirement of the forced currency, an important reform in the organization of the army, and a municipal aid law for Rome and Naples, were valuable measures among an unusual number of minor enactments.

The French advance into Tunis occurred at a time when the Left in Parliament was more disorganized and discordant than usual. The French preparations for landing troops on the Tunisian coast were the occasion for an onset against the weak and struggling ministry. The news stirred the political life of Italy deeply. The firm belief was that France intended to retain a supremacy of some description in Tunis, and the general feeling was that Italy must prevent it if by any means she could. It was a tradition of Italian politics that a military power should never be suffered to install itself upon that coast, from which Carthage menaced ancient Rome. Italy had also large and growing mercantile interests in Tunis, and regarded with complacency this point of ingress into the African trade as having been gained, and as likely to be retained, by the enterprise of her men of business. Hence arose the demand for a strong ministry which could command a firm majority in the Chamber of Deputies, and could with confidence take the decided steps which the juncture might render necessary. Massari, De Rudini, and Damiani addressed the formal interrogations to the ministry. Cairoli, the Prime Minister and Minister for Foreign Affairs, replied that France had made categorical declarations to both Italy and England that the expedition was designed simply to punish the Kroumirs, and that the *status quo* would not be altered. The assurances that furnished the grounds on which the Government defended its inactivity were not relied upon as implicitly by the deputies of the Right, and the dissentient fractions of the ruling party. The ministry were left in the minority on a vote of censure, April 7th, and handed in their portfolios. The

King, in view of the emergency and of the interminable discords and divisions in the Progressive party, was inclined to try a ministry from the Right. But the recalcitrant sections of the Left were composed of the more advanced thinkers of the party, and their co-operation with the Right was out of the question. The Right is the Moderate Liberal or Conservative party, which controlled the Government and worked out the consolidation of the kingdom on the lines laid down by Cavour during the first sixteen years of the national history. The controlling spirits of the disaffected faction were Nicotera and Crispi, who were not satisfied with the timid and faltering leadership of Cairoli and Depretis, and considered that they had the ability and parliamentary strength to control the policy of the Government. The King consulted with Sella, the leader of the Right, who could see no way for his party to assume or co-operate in the Government with the present House of Deputies. The King was unwilling to dissolve the Chamber if the difficulty could by any means be composed, because the long-projected electoral reform bill was to be dealt with in that session. Depretis was requested to seek to re-establish accord between the rival factions. When he obtained the pledge of the section-leader Nicotera, a majority was assured, and the King, on Sella's suggestion, declined the resignation of the Cairoli Cabinet, April 18th. The new developments of the French plans in Tunis gave rise to fresh interrogations, but the Government commanded a majority until the French treaty with the Bey was concluded. The ministers repeated the assurances made by the French Government, that no ulterior ends were pursued, stating at the same time that steps were being taken to protect Italian interests. On the 11th of May the French minister, Barthélemy Saint-Hilaire, issued a circular to the powers, accompanied with a yellow-book of corroborative documents, in which Italian commercial intrigues were intimated to have been one of the causes of the invasion. When the Government was informed of the conclusion of the treaty, they sounded the European governments on the subject of a conference, according to the precedent of the Berlin Congress, but were met with a peremptory refusal on the part of Germany. The alienation of France and Italy through the Tunisian question would seem to have entered into the calculations of Bismarck from the time when the subject of a French intervention in Tunis was informally broached in conversations between the delegates at the Berlin Conference. When the terms of the French treaty were made known, the Cairoli ministry resigned, May 14th, without waiting for the hostile vote of the Chamber. The King again turned to Sella, who seemed to prefer constituting a Cabinet from the pure Right, and appealing to the country to return him, if possible, the two hundred members which he lacked of a major-

ity; but he agreed to undertake the fruitless task of negotiating with the Left and Center for a coalition Cabinet. Farini, President of the Chamber, and Mancini, declined in succession the task of forming a Cabinet, and it was finally intrusted to Depretis, who succeeded, May 28th, in getting a ministry together of the same character as the one which had gone out. General Mezzacapo, who was offered the Ministry of War, declined to accept unless the new Cabinet would undertake the augmentation of the military budget by from 10,000 to 30,000 francs a year, to the amount of 400,000,000 francs in all, although neither he nor any other serious statesman entertained a thought of engaging in a war with France on account of the Tunisian difficulty.

The Italian people were deeply offended at the course taken by France to set aside Italian prestige in Tunis. The feeling permeated all classes, and was returned by the irascible people of France. In the riot at Marseilles, June 17th, the swelling anger broke out. This city contains a colony of Italian dock-laborers, mechanics, and merchants, numbering, according to the census of 1876, 61,428, besides a large transient population of Italian sailors and emigrants departing for and returning from America. Of the latter about 5,000 enter the city every month, stopping usually for some time. Crowds of people were gathered in the streets to see a body of French troops returning from Tunis march through. As they passed the house of the Italian Club, hisses were heard; probably emitted by Italian spectators on the sidewalk. The club-house was attacked by the mob, and street affrays between the two nationalities occurred in all parts of the city. The rioting was renewed on the following day, which was a Sunday, and the police did not quell the disorders until Monday night. In other towns of France murderous fights occurred between Italians and Frenchmen. In Naples, Genoa, Turin, and all the Italian cities, popular demonstrations took place in which the whole population participated. Prompt and efficient measures were taken by the Government to defend the French consulates and prevent any scenes of violence.

The claims of the Papacy to the lost sovereignty are still openly asserted by the Pope and unremittently pressed. On the other hand, the radical agitators, appealing to the patriotism of the people, embrace every opportunity to affront the Church and wound the religious sentiments of their fellow-citizens, which with certain classes of Romans are very strong and susceptible. The irritation has been passing away during the pontificate of Leo XIII, who, though still acting the part of a captive and martyr, has in many ways shown a conciliatory disposition and smoothed the difficulties between the church and the state. He is, therefore, held in a very different estimation by the patriotic Italians than was his predecessor. The section of the clergy who stand in the way

of a reconciliation have, however, not ceased their quiet agitation for the restoration of the temporal power of the Pope. A coarse exhibition of anti-clerical feeling, which was manifested on the occasion of the removal of the remains of Pius IX to the Basilica of San Lorenzo on the night of July 12th has again widened the breach between the Quirinal and the Vatican, and furnished the Pope with a substantial ground of justification for his persistent isolation. It was expected that the removal would be conducted with simplicity, and that none but priests would attend. Instead of this, a splendid funeral-car bore the remains, and a procession of some two thousand people followed it, bearing torches and chanting prayers. The people gathered from all parts of the city to witness the imposing spectacle. After the train had advanced some distance a band of from fifty to one hundred men appeared, who sang popular ditties in derision, hooted and jeered, jostled the torch-bearers, and attempted to put out the torches; and when the procession reached the place in front of the church they rushed in and created a scene of confusion and of terror to the numerous ladies who were among the torch-bearers.

After this the Radical and Republican clubs started an agitation in favor of the abrogation of the law of the Papal guarantees, while the Pontifical Secretary of State, Cardinal Jacobini, in a circular to the nuncios, and the Pope in an allocution, protested that the guarantees were of no effect—that the Government was responsible for the outrage of the 13th of July, and that the Pope's person would not be safe if he abandoned his seclusion. The possibility that the Pope would leave Rome, where he enjoyed neither liberty nor security, was hinted at. After a meeting held by the Radicals on August 7th—which was broken up by the police on account of a resolution offered which accused the Pope of lying, in asking permission for the removal of the corpse of Pius IX without pomp, and which urged the occupation of the Vatican palaces—the Pope declared that he would not leave Rome unless driven away by brute force. Agitation for the repeal of the law of guarantees was continued, and meetings were held in all the principal cities. The police interfered at nearly every meeting on account of language derogatory to the dignity of the Pope and of his guaranteed liberties. On the feast of the Assumption of the Blessed Virgin at Rome there were slight disturbances, but the streets were lined with soldiers, and the scoffing manifestations promptly suppressed. A portion of the clergy desired to accompany the pilgrimage to the Roman shrines in August, and other religious observances, with popular demonstrations; but the Government promptly interdicted every proposal for a demonstration from either side, and, although the liberty of meeting is guaranteed by the Italian Constitution, the interference of the police at every assembly to prevent votes being taken on resolu-

tions in favor of the abrogation of the law of guarantees was sufficient to prevent the agitation from spreading among other classes.

In October King Humbert and Queen Margaretha paid a visit to the Austrian imperial family at Vienna, where they were entertained with distinction. The King was accompanied by the Prime Minister, Depretis, and the Minister for Foreign Affairs, Mancini, and the journey had a political significance, clearing away for the present the clouds left by the popular clamor for the acquisition of Trieste and the Trentino, and indicating the inclination of Italy for an alliance with Austria and Germany in the event of European complications.

A great development has taken place within a very short period in the Italian press, both with respect to the number of newspapers printed and their literary excellence. At the beginning of the year, 149 daily papers were published in Italy, and 1,305 journals appeared weekly, semi-weekly, or tri-weekly. Of the dailies, 18 are published in Rome, 16 in Naples, 13 in Palermo, 12 in Milan, 9 in Florence, 6 in Turin, and 5 in Venice.

The town of Casamicciola, in the Island of Ischia, in the Bay of Naples, was almost totally destroyed by an earthquake which occurred on the 4th of March. Of the 4,000 inhabitants 3,000 were left homeless, and more than 150 were buried under the ruins of their houses. The first and severest of the two shocks lasted less than a quarter of a minute. Other, slighter, shocks were felt on the succeeding days. The disturbance was local, and not connected with the eruption of Vesuvius, which was taking place. It was attributed by Professor Palmieri, a distinguished Neapolitan seismologist, to the sinking of the soil consequent upon the undermining action of the mineral springs for which the island is celebrated. Another earthquake was felt over a considerable extent of territory in the Abruzzi on September 10th. Lives were lost and houses shattered at Castelfrentano, Chieti, and other villages. Many thousands were rendered shelterless. A second shock occurred at Castelfrentano on the 23d, followed by a land-slide, which carried away the site of the village. The Neapolitan coast was swept during the year by several hurricanes of uncommon severity.

There was a general census of the kingdom taken in December. The population of the city and suburbs of Rome was 300,292, the males numbering 167,327, and the females 132,965. The increase in ten years was 55,808 souls. Rome contained under Pontifical rule, as at present, a remarkable preponderance of males. The proportion was in 1871 118, and in 1881 115 males to 100 females.

A notorious Sicilian bandit, named Randazzo, was captured in New Orleans in July and taken to New York, whence he was extradited on the requisition of the Italian Government and on the testimony of witnesses sent over to prove his identity. He belonged formerly to

the band of the dreaded robber-chieftain Leone, and was captured with two of his companions after a desperate struggle in 1878, and lodged in jail at Palermo; but he leaped from the wagon when being conveyed to the court, and in spite of the vigilance of the police made his escape abroad. Since then to the date of his recapture he followed the trade of a fruit-dealer in New Orleans, where he sailed a small vessel on trading trips in the neighboring waters. He had many friends among the immigrants from Southern Italy settled in that city. The detective engaged for the Italian Government resorted to a *ruse* and conveyed him on shipboard and detained him there without legal warrant, but when the case came up before the court in New York, whence the order for his arrest had been issued, it was held

that the court could not discharge him on the ground of his having been brought within its jurisdiction by unlawful means. The circumstance of the evidence offered by the Italian Government being somewhat incomplete and conflicting, and that of his having been taken away from New Orleans where he claimed to have been living at the time when the crimes laid to his charge were committed, left a doubt in the public mind of his identity. When brought to trial, however, in Palermo he was proved by unquestionable evidence to be the brigand Randazzo. Among the numerous crimes and cruelties committed by him the most notorious was his latest, that of cutting off the ears of the English tourist Rose and sending them to his friends to terrify them into paying an enormous ransom.

J

JAPAN, an empire in Eastern Asia. The sovereign bears the title of "Tenno" or "Mikado." The reigning Mikado, Mutz-Hito, was born at Tokio, September 22, 1852, and succeeded his father, Komei-Tenno, in 1867. He was married on December 28, 1868, to Princess Haruko, born April 17, 1850, daughter of Prince Idchidgo. There is no regular law of succession, and, in case of the death or abdication of the Mikado, the crown does not generally devolve upon his son, but upon either the eldest or most distinguished member of the Shi-Shinnô, the four imperial families of Japan. These families are the Katura, Arisugawa, Fushimi, and Kanui. The power of the Mikado is unlimited in temporal as well as spiritual affairs. He acts through an executive ministry divided into nine departments, viz., of the Imperial House, Foreign Affairs, War, Navy, Finances, Interior, Public Instruction, and Ecclesiastical Affairs. At the side of the ministry stands the "Sain" or Senate, composed of thirty members, and the Shoin, or the Council of State, of an unlimited number of members, both nominated by the Mikado.

The area in 1881 was estimated at 382,363 square kilometres; the population, January 1, 1876, was 34,338,404, of whom 17,419,785 were males, and 16,918,619 females. The Bonin Islands, belonging to Japan, have an area of 84 square kilometres, and a population of 75. Tokio, the capital, inclusive of suburbs, had in 1881 a population of 1,140,566; Osaka, in 1881, 291,086. The number of foreign residents in 1879 was as follows:

CITIES.	Europeans and Americans.	Chinese.	Total.
Kanagawa.....	1,394	2,245	3,639
Tokio.....	367	54	421
Hioogo and Osaka.....	392	657	1,049
Nagasaki.....	214	653	867
Hakodadi.....	31	40	71
Total.....	2,395	3,649	6,047

The receipts and expenditures were estimated as follows, in the budget of 1880-'81 (in yens; 1 yen = 99.3 cents):

RECEIPTS.	
Customs.....	2,569,402
Ground-tax.....	41,901,441
Excise.....	5,965,029
Other taxes.....	4,122,372
Public works.....	1,407,647
Public domains and miscellaneous receipts.....	650,956
Total ordinary receipts.....	56,616,907
Extraordinary receipts.....	3,316,600
Total.....	59,933,507
EXPENDITURES.	
Public debt.....	21,448,906
Civil list.....	960,100
Pensions.....	596,744

Total.....	59,933,507

The public debt, on July 1, 1880, amounted to 358,047,291 yens; the reserve funds and other resources amounted to 51,325,515 yens, leaving 306,721,776 yens unprovided for.

The sudden transformation which the whole social fabric in Japan has been undergoing, since the revolution of 1868, excites the wonder of travelers and is a puzzle to every student of history. Apparently by command of

the authorities and without any spontaneous evolution, the political institutions, the social habits, the education, the ideas, and even the religion of the people, are completely transmuted. The sovereignty which accomplished such marvels is itself a usurped power, which dates back only a score of years, and which precipitated the shogunate with its prestige of seven hundred years of empire and was established in its place with scarcely a struggle. The Daimios, the mighty feudatory lords of the realm, were soon crushed by the quickly organized rule of the Mikado. The military caste of the Samurais alone survived the deluge which in a moment swept away the institutions of old Japan. These cavaliers still swaggered about with their two swords, displaying a blustering opposition to the new order of things. To this day the interior of Japan is rendered unsafe to European and American travelers by these survivors of mediæval Japan, whose weapons fly out whenever a foreigner comes in sight, at the thought of the destruction to old traditions which European influence has wrought, especially the degradation and rapid decay of the order of Samurais.

The statements were made by travelers in the earlier stages of the singular official revolution in Japan, that the change was entirely superficial and unsubstantial, that though the normal civilization of the people was disastrously unsettled, yet they were receiving nothing but a mere veneering of Western culture, a distorted and spurious Europeanism, in compensation for this demoralizing effect. Later observers perceive that the entire social culture of old Japan has been fatally smitten, but that the Japanese prove capable of readily assimilating much of the civilization of the West. It was but the exchange of one materialistic civilization for another, for the religious founts of Japanese development were already nearly dry, while in the social discipline and solidarity, that enable them to adapt themselves to such startling innovations, they already possess a higher development than the Western nations which they copy.

In these drastic changes much of the poetry of life, of the inspiration of art, of the moral groundwork and attractive characteristics of Japanese manners must necessarily be sacrificed. The most difficult and questionable part of the scheme of reformation is the not unsuccessful attempt to root out the prevailing Buddhist religion, which was introduced from China ages before and always favored by the Shoguns, in order to restore the ancient and obsolete Shinto cult, an abstract worship of Nature. The abolition of the existing religion is not impossible, since the people are already largely given over to religious indifference and skepticism, but the revival of the national religion, the forms of which were almost lost and the principles no longer understood, can have no further success than the political one which was intended, that of extinguishing the

lingering loyalty to the Shogun, and impressing the people with the idea of the antiquity and historical rightfulness of the Mikado's rule.

The development of the University of Tokio illustrates the ardor shown by the authorities in introducing and the capacity of the Japanese people for assimilating the best results of European progress. The Japanese received their first inkling of Western science in the beginning of the last century, through their contact with the Dutch. In 1744 an astronomical observatory was established. In 1811 a corps of translators was organized for the purpose of rendering into Japanese Dutch treatises on science and useful arts. Out of this grew a school of languages in combination with the translation office. The sciences of mathematics, botany, and chemistry were afterward taught in connection with Dutch, English, French, German, and Russian. In 1862 students began to be sent to Europe. After the revolution of 1868 the instruction in European science and languages, which had been restricted and confined to a certain privileged class, was fostered and extended much more liberally. The different special schools which were established were gradually consolidated, and the high school for the teaching of Chinese and Japanese learning and literature united with those devoted to Western science. Many changes in the system of instruction, the transfer of the direction of studies to English, German, American, French, and Japanese instructors in turn, interfered with the due development of the system of higher education. In 1876 special courses of law, chemistry, and engineering were instituted, besides the general curriculums of science and arts. From the following year English was the only European language employed in instruction, and French and German discarded in the class-room, except for special studies in the law and science departments, in which instruction was still given in French. In 1878 the medical school was added to the others, and the university regularly constituted on the model of the leading European high schools. The Botanical Garden was placed in charge of the authorities of the university. A magazine was published; the discovery of shell-heaps by Edward S. Morse gave an impulse to archæological and palæontological researches; students were sent abroad, after the completion of their courses in the university, to pursue their special branches in the schools and libraries of Europe, and returned to impart their attainments to others; and so the university acquired rapidly the character and spirit of an institution of learning. In the department of law a very thorough course of English common law is taught by English instructors in addition to the principles of mercantile and international law and theoretical jurisprudence; but the civil law is neglected, with the exception of an exposition of the French code. All this is supplementary to the instruction in ancient and modern Jap-

anese law by Japanese professors. The department of science is divided into six courses: (1) chemistry; (2) mathematics; (3) physics and astronomy; (4) biology; (5) engineering, geology; (6) mining and metallurgy. The instruction is strongly colored by the new development theories and keeps abreast of the latest speculations. In mathematics and chemistry the courses of instruction are very complete. The department of literature is divided into two courses: (1) philosophy, political philosophy, and political economy; (2) Japanese and Chinese literature. In the course of philosophy the views of the English thinkers of materialistic tendencies are laid before the students as soon as they are published. It is the design of the Government to dispense with instruction in the English language as soon as possible, and have all the lectures and examinations in Japanese. The president and vice-president are men who have been long identified with the development of the higher education in Japan. Hiroyuki Kato has been president from the start. The professors and instructors number about a dozen Europeans, nearly all English, and three times as many Japanese, with two or three Chinese. The number of students pursuing, in 1881, the exceedingly various and thorough courses was 205. Each of the well-instructed graduates is a furtherer of science and culture in Japan.

The Japanese Government has just published at Yeddo a large dictionary of military, naval, and other technical terms in five languages—Japanese, French, English, German, and Dutch. It is the first Japanese dictionary printed on the European plan, and is illustrated with pictures engraved with the greatest care.

The first telegraph was erected in Japan in 1871. At the beginning of 1880 there were 3,929 miles of line, and 9,345 miles of wire. The number of telegrams sent during the previous year was 1,272,756, of which about 96 per cent were in the Japanese language; while the number of cable messages was 22,695. Although the Japanese language has no regular alphabet, the sounds of the Katakana syllabary are represented by extending the Morse characters to combinations of five dots and dashes. By thus supplementing the signs of the international code, forty-seven characters were obtained, and the alphabet has worked with satisfactory results for ten years. Japanese youths are trained as operators in a telegraph-school. The average charge for a message requiring twenty characters is only about two cents for a distance of sixty miles. In 1880 there were 112 offices open for general use, and seventy others used by the Government. In 1880 the receipts amounted to \$528,100, and the expenditures to \$495,660, this being the first year in which the receipts were greater than the working expenses. The telegraph was largely used in the field in the Satsuma rebellion of 1877, and contributed materially to the suppression of the revolt. The Sat-

suma rebels were particularly active in forced marches, but their movements were frustrated every time through the warnings communicated by the wires. For this purpose 511 miles of line were constructed in the rear of the army, light, portable posts being used, the trees utilized for supports, and vulcanite insulators employed.

The total number of postal stations on June 30, 1880, was 4,377. The number of letters sent was 34,627,343; of postal-cards, 17,345,212; of newspapers, 14,256,795; of samples and books, 829,063; letters sent free of charge, 1,885,653. The aggregate value of the money orders was 4,604,027 yens.

The Japanese Government has established a Department of Agriculture. The subjects which the local officials charged with the encouragement of agriculture in the provinces have submitted to it for consideration are—the revision of the methods of preparing statistics of agriculture; exchanges of seeds between different districts; the supply of manure; the investigation of the fisheries, and the preservation of fish, sea-weeds, and other marine productions; and the offering of rewards for services tending to the improvement of agriculture.

Flower-culture has always been pursued with careful attention in Japan. Flowers are seen in every house, rich or poor. New varieties of flowering plants are eagerly bought. Gardening and the art of arranging nosegays are taught in the schools.

When the feudal clan system was finally broken up in 1871, the present administrative division of the country was made. Japan is divided into three *fu*, thirty-five *ken*, and one *han*. Each *fu* is administered by a *chiji*, or governor; each *ken* by a *rei*, or prefect; and the *han* by a vassal prince. The *fu* are the districts of the great cities—Tokio, Kioto, and Osaka.

The Supreme Council or Cabinet of the Mikado is called the Dai-jo Kuwan, or great governing council, the name being taken from a body which was constituted in the eighth century. The Council is composed of the Prime Minister, two Vice Prime Ministers, and the Ministers of Foreign and of Home Affairs, of War, Finance, the Marine, Public Works, Justice, and Colonies and Agriculture. The entire government of the country is conducted by this body. The retention of Sanjo in the office of Dai-jo-Dai-jen, or Prime Minister, has had a considerable effect in reconciling the antagonisms between adherents of the old and of the new systems. He was one of the leading nobles at the old Kioto court, and was in the beginning an opponent of the changes which he himself afterward aided materially in bringing to pass. He is now accounted a thoroughly devoted supporter of the Mikado and the new order of things. The Vice-Minister Iwakura, the intellectual leader in the great transition, was also a court noble. He did not become an advocate of unrestricted foreign intercourse, even

after the revolution, until his mission to Europe and America in 1871.

The second governing body is the Genro-In, or Senate. The name signifies House of Seniors. It is composed of men who have served the country with recognized distinction, noblemen, officers who have given proofs of ability in the administrative departments, and men eminent in politics throughout the country. The Emperor's decree creating this body stated that it was to enlarge the law-making power. Its powers are confined to the approval of laws submitted to its consideration by the ministry.

The elective local assemblies were established in 1878. They sit in March of each year for a time not to exceed thirty days, and, subject to the control of the Home Minister, they deal with questions of local taxation. The qualifications for electors are an age of twenty years, registration, and payment of at least five dollars' land-tax. Each voter must write the name of his candidate upon the voting slip.

Gold is, nominally, the monetary standard in Japan; but the heavy expenses imposed on the Government for the suppression of rebellions and pensioning the Shogun and Daimios, had diminished the coin reserve and augmented the paper currency, so that a disparity of values exists. The currency unit in Japan is the *yen* or dollar, which is divided into *sen* or cents, and *rin* or mills. The unit of exchange at the treaty ports is the Mexican dollar. The paper money, or *yen satsu*, varies according to their comparative abundance in value. While they stood at 8 per cent discount in 1877 against gold *yen*, in previous years, although they are not redeemable in specie, they had actually stood at a premium. The large amount issued during the Satsuma rebellion has been the cause of their standing constantly below par since then. The Government have coined a trade dollar in recent years, identical in weight and fineness with the American trade-dollar, and four grains heavier than the silver *yen*. This new coin is beginning to circulate extensively in China and other parts of the East. The coins of gold, silver, and bronze struck at the Japanese mint already compare favorably with the coinage of any other country.

The military system has necessarily been built up from the foundation since the feudal system prevailing under the Shogun was abolished. The new army was formed under a conscription law, by which every male between the ages of seventeen and forty is subject to three years of military service with the colors, and to two years in the first, and two years in the second division of the reserve. The remainder of the period of military liability he is enrolled in a reserve corps, somewhat resembling a Landwehr. This system provides nearly 70,000 men liable to be called upon for military duty. From this number the regular force is recruited by lot. The normal strength of the army is 35,560 men in peace, and 50,230

in war-time. The troops have been highly trained, chiefly under French officers; but the instruction is now conducted almost altogether by Japanese officers. The Imperial Guard, which is the flower of the army, is selected from the Samurai class. The organization of the army of the line is given as follows:

BRANCH.	Number in peace.	Number in war.
Infantry (14 brigades, 42 regiments).....	26,880	40,320
Cavalry (3 regiments).....	360	450
Artillery (18 companies).....	2,160	2,700
Engineers (10 companies).....	1,200	1,500
Military train (6 companies).....	360	450
Marine artillery (9 companies).....	720	800
Total.....	31,680	46,250

The Imperial Guard is made up of two infantry brigades of two regiments each, 3,200 men; one regiment of cavalry, 150 men; two companies of artillery, 300 men; one company of engineers, 150 men; and 80 men in the commissariat; in all, 3,880.

The Japanese police is a new development. The discipline and intelligence shown by the force, and the satisfaction of the people with the new institution, have been remarked with admiration. The police is made up of 18,000 picked men, who have been drilled and instructed in their duties with great care. They exercise judgment and consideration in their interferences with the acts of the people, and possess the confidence of all in a high degree, being regarded everywhere as the protectors of the people from disturbance and submitted to as the authorized officers of the law. They are uniformed in European costume. The dismissal of the Samurais from their functions and privileges left the country entirely without a constabulary; but the efficiency developed by the police in a few years is of the very highest order.

Before the revolution of 1868, Japan had no ships, properly speaking. There was a considerable number of junks, some of nearly 200 tons, but used only as coasters. The state had a few that could sail as far as the Loo-choo Islands, Formosa, or China; but their primitive and defective form made them unfit and dangerous for such long distances. These junks were exclusively reserved for ambassadors or literary men, all commercial relations with foreign countries being strictly forbidden by Japanese laws. It is only since the restoration, when the Mikado's power was firmly established, that the Government thought of creating a navy and of encouraging the people to build merchantmen after European models. The effect of removing restrictions and encouraging mercantile enterprise was remarkable. In 1873 the merchant navy consisted of 110 steamers, with an aggregate tonnage of 16,088; 37 sailing-vessels, with 8,488 tonnage; and 22,692 junks. Since that date the number of ships has constantly increased, and was in 1879 as follows:

	Number.	Tonnage.
Steamers.....	166	42,763
Sailing-vessels.....	714	27,551

The number of junks decreased 3,978 in the same time. The construction of ships in 1880 was on a greater scale than in preceding years.

The number of ships that entered the Yokohama harbor during the year 1880 was as follows:

Foreign mail-packets	91
Merchant steamers.....	60
Sailing-ships	146
National mail-packets and merchant-vessels....	1,225
Total.....	1,522

The amount of duties received by the Yokohama custom-house during the year 1880 was 1,895,587 yen.

A Japanese commissioner was sent in 1881 to Constantinople and empowered to negotiate with the Minister of Foreign Affairs for direct commercial relations between Japan and Turkey. Tea and silk are the principal articles which the Japanese wish to put upon the Constantinople market, and to this end the Government proposes the establishment of a direct line of steamers.

Samples of ten different sorts of marble were sent from Japan to the Melbourne International Exhibition, held in 1881. One was a marble, similar to the Italian Sevaressa, so much in demand in Europe and America for columns, mantel-pieces, etc. It is found on the Soukenawa Mountain, and worth at Yokohama \$2.20 per cubic foot. There are quarries of a blue-and-white marble, of a fineness seldom met with. Another marble is black, resembling in all respects Belgian and Irish marbles of the same color. Another sample was a statuary marble of great purity, extracted from Mayoni Mountain, and valued at about \$8 per cubic foot. Another statuary marble is claimed to be equal to the best Italian marbles. A specimen of alabaster of fine color was also exhibited.

JEWS, THEIR NUMBERS, AND THEIR PERSECUTIONS IN GERMANY AND IN RUSSIA. An accurate census of the Jewish population of the world can not be obtained without more difficulty than its importance demands. The most reliable estimates are very uniform in putting the number of the Jews above six millions. Professor Bruniatti, in the "Archives of Statistics," puts the number at seven millions. In Europe their number is reckoned to be 5,500,000, averaging among the Latin race one Israelite to 1,100 persons, and among the Slav races forty to the 1,000. In Russia they are reckoned at 2,700,000; Austro-Hungary, 1,500,000; Germany, 650,000; Roumania, 400,000; Turkey, 100,000; Holland, 70,000; France, 50,000; England, 70,000; Italy, 40,000; Switzerland, 7,000; Spain, 6,000; Greece, 5,000; Servia, 4,500; Belgium, 3,000; Sweden, 2,000;

Portugal 1,000. In Africa they are reckoned at 500,000, of whom 200,000 are in Morocco, 34,000 in Algiers, 60,000 in Tunis, 100,000 in Tripoli, and 8,000 in Egypt.

In Asia the Israelites are estimated at about 240,000, of whom 150,000 are in Asiatic Turkey and Arabia, 30,000 in the Caucasus, 20,000 in Persia, 15,000 in India, 12,000 in Turkistan, and 1,000 in China.

The number in the United States is estimated at 300,000, and 8,000 in South America; in Oceania and Australia, at the most, 20,000.

At the Council of the Union of American Hebrew Congregations held at Chicago, Illinois, in July, the Committee on Statistics reported that there were in the United States, in the year 1878, 278 congregations, with a membership of 12,546, and the number of Israelites, as far as could be ascertained, was 230,257; and, making fair allowance for such cities, towns, or villages, from which no information could be derived, the Jewish population of the United States can be safely placed at 250,000.

The "Jewish World" publishes the following statistics of the Jews of the world, recently compiled by the German ethnographical scholar, Richard Andree:

EUROPE:

Roumania.....	400,000
European Russia.....	2,552,549
Austro-Hungary (1869).....	1,372,333
German Empire (1875).....	520,575
Holland (1869).....	63,008
European Turkey (before the last war).....	71,372
Luxemburg (1875).....	661
Switzerland (1870).....	6,996
Denmark (1870).....	4,290
Great Britain and Ireland (1875).....	63,300
Servia.....	2,000
France (1872).....	49,439
Italy (1871).....	35,356
Greece (1870).....	2,552
Belgium (1875).....	3,000
Sweden (1870).....	1,886
Norway (1875).....	84
Spain (1875).....	6,000
Portugal.....	1,000

Total in Europe..... 5,166,826

Africa..... 402,996

Asia..... 182,647

America..... 897,963

Australia..... 20,000

Grand total..... 6,080,132

This does not include the Falashas, who number about 200,000, and other pseudo-Jews.

Agitation in Germany against the Jews has been a serious affair. There naturally arise in relation to it the following questions, viz.: Who are the parties attacked, and who are the assailants? What faults are the Jews accused of? In what way is their influence held to be injurious to political, economical, or social life in Germany? What practical measures are proposed? And in what spirit do the Jews meet the charges, and how do they repel the accusations made against them?

1. The word "Jew" is used in its strictly religious sense, and also as applied to the Jew-

ish race. The agitation is directed mainly against the Jews as a race, although many of these have become Christians, and many have abandoned altogether attendance at the synagogues and places of Jewish worship. The "Anti-Semitic League" is the title adopted by the society inimical to and working against the Jews; and it includes men who, in other respects, are antagonistic to each other in political and religious opinion.

2. Generally speaking, it is said, "Things in Germany are unsatisfactory, and the Jews are the cause of it"; and, though there are Jews in all European countries, their influence, it is averred, is greater in Germany than elsewhere, and the German Jews are more disagreeable than those of other countries. There are said to be 650,000 Jews in Germany, and only 50,000 in Great Britain, and the same number in France. The Jews, both orthodox and reformed, are, it is alleged, conceited and vain, and quite lacking in modesty. They are also accused of being irreligious, and especial haters of Christianity; as, in short, the most intolerant and stubborn race on the face of the earth. Further, they are charged with servility, self-seeking, sensuality, and abhorrence of honest work.

3. One energetic writer denounces the Jews in Germany as "dunces and destroyers of human sociability and co-operation." Numbers of these are members of the bar, and, as the intervention of counsel is compulsory in Germany, these men gain by it in money and otherwise. Bismarck, it is claimed, made use of the National Liberal party to accomplish the unity of the German Empire. The Jews were largely members of this society, and, when Bismarck did not want its help any longer, the Social Democrats charged that the Jews were the ruin of the party. Various measures in the direction of progress are due to the Jews, and by these they have produced feelings of hatred in the community. It is further charged that the Jews have gained possession of the press; that they sway or manufacture public opinion in a vast variety of ways; and that they are incapable of self-denying devotion to the state in its civil service. In regard to the economic life of the German nation, the Jews are charged with having been more acute than their neighbors, and with having made money in speculation and the like when most of the people were ruined. Hence, it is said that the Jews have robbed the Christians. The law on joint-stock companies, the introduction of a gold currency, and the founding of the German Imperial Bank, are all said to be in the Jewish interests. Still worse, in the agricultural districts, the Jews are charged with overreaching the peasants, and trying to get their land from them by obtaining heavy mortgages, foreclosing them, and driving out the owners. The Jews seem to be rich and luxurious everywhere, and can get the best of everything. One bitter enemy says, worst of all, that nine

tenths of the prostitutes in Paris, Vienna, Berlin, and Budapest, are Jewesses.

4. In regard to the practical measures proposed by the agitators, in order to accomplish their designs, one writer suggests that the Jews be restrained in the matter of mortgages on property; that the regulations of stock-exchange transactions and joint-stock companies be altered; that Jewish judges be appointed only in proportion to the Jewish population; that Jewish teachers be expelled from primary schools; and that, "above all, there be a strengthening of the old Christian Germanic spirit." Another writer proposes to strike out of the Jewish religious service anything that is anti-national. If this be objected to by the Jews, then crush the religion entirely. Also, make all public appointments in proportion to the population, and allow anybody to refuse to be tried before a Jewish judge, and any judge to reject Jewish evidence. It is further proposed to "mediate" the fortunes of wealthy Jews (that is, in reality, to "confiscate" them); to allow no Jew to be a mortgagee, editor, or contributor to a public journal, or to hold real property, or to immigrate into Germany, or to teach in any except Jewish schools. These are the extremest measures proposed, although many, who deem Jewish influence prejudicial to Germany, do not sympathize with coarse invective and violent expenditures.

5. Naturally, the Jews in Germany are indignant against the various charges put forth by their enemies. A general denial is made, and specific accusations are met with argument and evidence of facts. Some claim the distinctiveness of their race as a right, and ascribe to it a special mission and superior powers. The majority of German Jews, however, think differently, and claim that the Jews, in their native land, are really and truly Germans, or fast becoming such. Complaints against Jewish usurers and promoters are freely acknowledged; but, on the other hand, it is averred that exaggerated statements are made in regard to these. As to the press, it is stigmatized by the Jews as a myth, that they have preponderating influence in this respect, and various prominent journals are named as having hardly any Jews on their staff. In respect to the alleged general feeling of antipathy to the Jews, writers in their defense affirm that it is both extravagant and unjust to charge them with being the causes of all the evils of the times, or to defame them all as speculators, usurers, or old-clothes dealers. That German Jews are largely irreligious may be admitted as true; but, it is said, in reply, Germans who are not Jews are equally open to the charge of irreligion. And, finally, as the Jews are found in all schools and parties, in politics, art, and religion, it is not fair to condemn them unqualifiedly, as is done by the agitators. They have acquired their wealth, it is claimed, by energy, skill, and habits of

thrift and self-denial; and they demand, as their right, to have mind and feeling, rather than race, regarded as true criteria of good citizenship and national character.

But it is in Russia that the persecutions of the Jews have been of a most violent character, causing the destruction of families and whole villages. The scenes of these horrors have taken place in a tract of country in Russia extending from the Baltic to the Black Sea, and containing an area equal to that of France and Great Britain combined. Ever since the movement was begun against the Jews in Germany, the apprehension has prevailed that it would extend to Russia, and take a form more adapted to the less civilized state of the country. Early in April rumors of a rising had reached Elizabethgrad, and caused the heads of the Jewish community, consisting of 10,000 of the 30,000 inhabitants, to apply for special protection from the governor. No notice was taken of the application, and on April 27th a fearful outbreak took place.

A very authentic account* relates that a religious dispute in a *cabaret* led to a scuffle which grew into a general *mêlée*, till the mob obtained possession of the dram-shop and rifled it of its contents. Inflamed by the drink thus obtained, the rioters proceeded to the Jewish quarter, and commenced a systematic destruction of the Jewish shops and warehouses. At first some attempt was made by the Jews to protect their property; but this only served to increase the violence of the mob, which proceeded to attack the dwellings of the Jews and to wreck the synagogues. "Amid the horrors that ensued a Jew named Zololwenski lost his life, and no fewer than thirty Jewesses were outraged. At one place, two young girls, in dread of violation, threw themselves from the windows. Meanwhile the military had been called out, but only to act at first as spectators and afterward as active participants. One section of the mob, formed of rioters and soldiers, broke into the dwelling of an old man named Pelikoff, and on his attempting to save his daughter from a fate worse than death, they threw him down from the roof, while twenty soldiers proceeded to work their will on his unfortunate daughter. When seen by the correspondent who narrates this fact, Pelikoff was in a state of hopeless madness, and his daughter completely ruined in mind and body. The whole Jewish quarter was at the mercy of the mob till April 29th. During the two days of the riots, five hundred houses and one hundred shops were destroyed, whole streets being razed to the ground. It may be added that the property destroyed and stolen was reckoned at 2,000,000 rubles."

The foes of the Jews were encouraged to wider and more systematic attacks, by the evidence furnished, through these scenes, of a pent-up anti-Jewish passion. Placards were distributed by professional ringleaders from Great

Russia, in which it was declared that the Czar had given his orthodox subjects the property held by the Jews. Hence, after a week's pause, a whole series of riots broke out, commencing on May 7th, at Smielo, near Czer-gass, where thirteen men were killed and twenty wounded, and 1,600 were left without homes. Next day, Sunday, May 8th, a most serious riot broke out at Kiev, once the capital of Russia, and still an important town, containing 20,000 Jews in a population of 140,000. Here the riot had been definitely announced for the Sunday, and the Jews sent a deputation to the governor, requesting him to call out his soldiers to prevent disturbance. He bluntly refused, saying that he would not trouble his soldiers for the sake of a pack of Jews. During the riot, which broke out on the day fixed, the police and the soldiers again acted the same part they had at Elizabethgrad. The first procedure of the mob had been to storm the dram-shops, and, staving in the brandy-casks, to make themselves drunk with the liquor. During the period of license that followed, four Jews were killed, and twenty-five women and girls were violated, of whom five died in consequence, as was proved at the subsequent trials. At the house of Mordecai Wienarski, the mob, disappointed in the search for plunder, caught up his little child, three years old, and brutally threw it out of the window. The child fell dead at the feet of a company of Cossacks who were drawn up outside, yet no attempt was made to arrest the murderers. At last, when several houses were set on fire, the military received orders to make arrests, which they proceeded to execute with much vigor, making 1,500 prisoners, among whom 150 were Jews, arrested for protecting their lives and properties. No less than 2,000 Jews were left without shelter by the dismantling or the burning of their houses, and for the relief of immediate necessities a Kiev committee soon afterward had to disburse the sum of £30,000.

Next day similar scenes of violence occurred at Browary, in the neighborhood of Kiev, in the province of Czernigow. On the same day still more disgraceful deeds were enacted at Berezowka, in the government of Cherson. Here lust seemed more a principal motive than plunder. While the Jews of the village were at synagogue, a mob attacked the Jewesses and violated many of them, causing the death of three; others who escaped the worse evil were driven into the river, and nine ultimately died from the effects of the exposure. When the Jews came to the rescue, two of them were killed and a young lad stoned to death.

On the next day, May 10th, the neighborhood of Kiev was again visited at Konotop and Wassilkov. The attacks had been planned at both places. At the latter place eight lives were lost, seven at an inn kept by a Jew named Rykelman. He was forced to admit the mob to his wine-cellars, and, during his absence in

* Correspondence of the London "Times."

search of assistance, the drunken rioters cut the throats of his wife and six children.

By this time the chief towns and villages of Southern Russia were ablaze with violence and riot. Throughout the whole of the governments of Cherson, Taurida, Ekaterinoslav, Poltava, Kiev, Czernigov, and Podolia, the notion spread fast as wild-fire that the Jews and their property had been handed over to the tender mercies of the populace. At Wasilgin, the mayor even read a copy of the supposed ukase to the citizens, and a riot would have ensued had not the village priest done his duty, and declared his belief that no such ukase existed. At Alexandrovsk, on the banks of the Dnieper, the operatives carried out what they thought to be the will of the Czar, on May 13th, rendering 300 out of the 400 Jewish families of the place homeless, and destroying property to the amount of 400,000 rubles. As usual, the riots were previously announced, and the appeal to the governor to send for additional troops proved fruitless. At Ekaterinoslav, a projected riot was happily prevented by the issue of a proclamation by the local authorities, declaring the Jews to be true subjects of the Czar, and entitled to protection of their property. At Polonnoze, near Kiev, a disaster was averted by the forethought of the mayor, who changed the market-day to Saturday; and, on the peasants complaining, he read them a lesson on the utility of the Jews as middle-men, and induced them to promise not to molest their Jewish fellow-citizens.

From Alexandrovsk the instigators paid a visit to the Jewish agricultural colonies in the province of Ekaterinoslav, which have been established for more than forty years. The chief centers—Gulaypol, Orjehow, and Marianpol—were visited in turn, and, though no violence seems to have been done to the persons of the Jews, their farms were almost entirely destroyed. At Orjehow, the instigators who led the mob were dressed as police-officers, and produced a document falsely professing to be the proclamation of the Czar. The farming implements were all destroyed, and 500 cattle and 10,000 sheep driven off. At Kamichewka, the Jews adroitly turned the supposed ukase of the Czar into a safeguard. Hearing that the rioters were advancing to attack, they brought the keys of their houses to their Christian neighbors, saying that, if the ukase were true, it would be better that their neighbors should have their property than the rioters; and, if the ukase proved to be untrue, of course their good neighbors would return the keys. The Christians of the village accordingly repulsed the rioters, and, in a few days, the Jews of Kamichewka were again in possession of their property.

Up to this time the riots had chiefly arisen among the urban populations, but they now spread into the rural districts, and reached every little village where even a single Jew resided.

Meantime the sea-port Odessa had likewise been the scene of an anti-Jewish riot. Originally announced for May 13th, it was postponed till Sunday, May 15th, without, however, any precautions being taken by the governor, who had, as usual, been duly warned of the impending outbreak. Though only lasting for six hours, the riot resulted in the death of a Jew named Handelsmann, and eleven cases of violation are reported, one resulting in death. Here the Jews seem to have been most energetic in their resistance. Of the 800 arrests made, 150 were Jews, 26 of whom were afterward charged with carrying revolvers without a permit. The police estimated the damage done at 1,137,831 rubles, while those more immediately concerned raised the sum to 3,000,000. Similar scenes took place on the same day at Wolezysk, on the borders, where a riot had been announced for the Sunday. A week afterward the lower orders of Berdyzew rose against the Jews, and, on May 24th, a riotous disturbance occurred at Zmerinka, in Podolia.

Thus, within a month of the first outbreak, almost every town of importance in Southern Russia had seen such horrors as above described. Apart from the influence of ringleaders, the rioters had no cause to incite them to rapine except the force of contagion and the impression that the Czar had really transferred all Jewish property to his orthodox subjects. If once this impression had been officially removed, the epidemic would have been checked. In many cases it was distinctly shown that the peasants liked the Jews, and only pillaged because they thought it had been ordered. At Bougaifka, for example, a few days after the peasants had destroyed the property of the Jews, they became contrite, and gave their Jewish neighbors eight hundred rubles as some compensation for the damage they themselves had caused. In the face of such a fact, it is tolerably certain that, if the supposed proclamation had been energetically and officially denied, the riots might never have reached the extent that they eventually did. The contagion spread as far as Saratov in early June, and thence to Astrakhan; it even reached a town near Tomsk, in Siberia, and caused an anti-Jewish riot there. The only bright spot in all this gloom was the condition of Poland, where Jews and Poles have always lived in amity. This continued until General Ignatieff directed the Governor of Poland to appoint commissions of experts to consider how the Jews should be dealt with, to which fact persons on the spot attribute the rise of anti-Jewish feeling that culminated in the Warsaw riots. But outside of Poland these outbursts of popular prejudice placed a population of nearly two millions in perpetual dread of their lives and property. At times they dared not remove their clothes night or day, fearing that they might have to flee at any moment. Ever since last April that feeling of fear and insecurity has ruled the lives of all Russian Jews.

Not a month, scarcely a week, has passed since then without some outbreak or other occurring to confirm these fears and render them the more acute.

The outrages recounted above have been selected from a list of over 160 towns and villages in which cases of riot, rapine, murder, and spoliation have been known to occur during the last nine months of 1881. Out of these information was collected from about forty-five towns and villages in Southern Russia. In these alone are reported 23 murders of men, women, and children, 17 deaths caused by violation, and no fewer than 225 cases of outrages on Jewesses.

Finally, this catalogue of horrors must be concluded by a reference to the riots at Warsaw on Christmas and the following days. The detailed events of those days, when 300 houses and 600 shops were pillaged and devastated, and thousands of victims rendered homeless and reduced to beggary, are doubtless fresh in every one's memory, but certain facts must be again referred to, owing to their typical character. In the first place, the riot was clearly planned, the alarm of fire being simultaneously raised in at least two churches, and the mob being directed by men who spoke Polish with a Russian accent. The culpable neglect of the military authorities of Warsaw in refusing to make use of the 20,000 men forming its garrison, finds its counterpart in the similar behavior of the Governors of Kiev, Elizabethgrad, and Odessa, earlier in the year.

Besides appealing to the blind passions of the mob, the Jew-haters of Russia have, during the year, resorted to more systematic efforts to harass the hapless Israelites. The Russian *mujik* has a method almost peculiar to himself of expressing his rage and hatred. Moscow is but the most celebrated instance of periods of Russian history when incendiarism has been the order of the day. Whenever the fever-point of excitement is reached, arson is usually the direction in which it overflows. So well is this recognized in Russia, that the peasants have a technical name for the deliberate firing of towns—the “red cock” is said to crow. During the past year this method of revenge has been resorted to on a large scale against the Jews of Russia, especially in the west. By the end of June the “red cock” had crowed over fifteen towns in Western Russia, including Mohilev, containing 25,000 inhabitants, Vitebsk, with 23,000, and Slonim, with 20,000, as well as smaller towns like Wolcowysk, Scherwondt, Augustowo, Nowo-Guedek, Ponowicz, and Lipsk. Many thousands of Jews were rendered homeless by this means, and on July 3d, 6,000 Jews lost their homes by fire at Minsk, 4,800 being deprived of every means of subsistence at the same time. The town of Pinsk, in the same government, suffered a like fate. And shortly afterward a conflagration took place at Koretz, in Volhynia, in which thirty lives were lost, and 5,000 souls left without a home. Every week added to the number of

fires in towns inhabited by Jews, till, by the end of September, the list extended to forty-one towns. This probably involved the loss of home to 20,000 Jews.

To the mass of homeless and penniless creatures in Southern Russia must be added the many victims of pillage. The violence of the mobs often wrecked whole streets of houses as completely as any fire, and 2,000 were thus rendered homeless at Kiev, 1,600 at Smiello, 1,000 at Konotop, 600 at Ouchow, and 300 at Aluchoff. The value of property destroyed in the south has been reckoned to reach £16,000,000 sterling.

The steps taken by the Government in relation to these disturbances may be stated in a few words. On May 23d the Czar, having been appealed to by a deputation of Jews in St. Petersburg, expressed his intention of dealing with the evil. An agent was dispatched to the south to make inquiries. He returned and reported that further inquiries were necessary. General Ignatieff now introduced a measure by which the provincial assemblies might be superseded by local committees of experts on this special subject, and on September 3d the following declaration was issued:

For some time the Government has given its attention to the Jews, and to their relations to the rest of the inhabitants of the empire, with the view of ascertaining the sad condition of the Christian inhabitants brought about by the conduct of the Jews in business matters.

For the last twenty years the Government has endeavored, in various ways, to bring the Jews near to its other inhabitants, and has given them almost equal rights with the indigenous population. The movements, however, against the Jews, which began last spring in the south of Russia, and extended to Central Russia, prove incontestably that all its endeavors have been of no avail, and that ill-feeling prevails now as much as ever between the Jewish and the Christian inhabitants of those parts. Now, the proceedings at the trial of those charged with rioting and other evidence bear witness to the fact that the main cause of those movements and riots—to which the Russians, as a nation, are strangers—was but a commercial one, and is as follows:

“During the last twenty years the Jews have gradually possessed themselves of not only every trade and business in all its branches, but also of a great part of the land by buying or farming it. With few exceptions they have, as a body, devoted their attention not to enriching or benefiting the country, but to defrauding by their wiles its inhabitants, and particularly its poor inhabitants. This conduct of theirs has called forth protests on the part of the people, as manifested in acts of violence and robbery. The Government, while on the one hand doing its best to put down the disturbances and to deliver the Jews from oppression and slaughter, have also, on the other hand, thought it a matter of urgency and justice to adopt stringent measures in order to put an end to the oppression practiced by the Jews on the inhabitants, and to free the country from their malpractices, which were, as is known, the cause of the agitation.”

With this view, it has appointed commissions (in all the towns inhabited by Jews), whose duty it is to inquire into the following matters:

1. What are the trades of the Jews which are injurious to the inhabitants of the place?

2. What makes it impracticable to put into force the former laws limiting the rights of the Jews in the

matter of buying and farming land, the trade in intoxicants, and usury?

3. How can those laws be altered so that they shall no longer be enabled to evade them, or what new laws are required to stop their pernicious conduct in business?

4. Give (besides the answers to the foregoing questions) the following additional information: (1.) On the usury practiced by the Jews in their dealings with Christians, in cities, towns, and villages. (2.) The number of public-houses kept by Jews in their own name, or in that of a Christian. (3.) The number of persons in service with Jews, or under their control. (4.) The extent (acreage) of the land in their possession, by buying or farming. (5.) The number of Jewish agriculturists.

In addition to the above-mentioned information to be supplied, every commission is empowered to report on such conduct and action of the Jews as may have a local interest and importance, and to submit the same to the ministry.

There are those who assert that the direct cause of the objection of the Russians to the Jewish people is the natural result of the Russian laws, which restrict their rights and mark them off from the rest of the inhabitants; and they assert that the only solution of the question is to grant to the Jews full equality with citizens.

The "Official Messenger" of St. Petersburg made, in February, 1882, the following statement relating to the arrests of the rioters:

The number of persons arrested during the anti-Jewish disorders and brought to punishment, as far as the Government is at present informed, was as follows: General Government of Kiev, up to 1,000 persons. In the town court and province of Kiev, 105 were tried by court-martial, and 274 expelled from the town. In Odessa, those arrested numbered altogether 801; dealt with by courts and administrative order, 243; expelled from the town to places of nativity, 558. In Taurida the Government arrested 124; 80 were tried by courts, and 8 by administrative order. More than 30 have been liberated. In Elisabetgrad, and other parts of the Kherson Government, 900 were arrested. In Ekaterinoslav, the Government arrested 341, and 296 were committed for trial. In the Nizhnee-Chernigov Government 344 were arrested, and in different parts of the Poltava Government 165. In the Kharkov Government, out of an unknown number arrested, 795 were tried by court-martial from June to December. During the Warsaw riots in December, 3,151 persons were arrested, of whom 2,302 were committed for trial.

These figures show that the measures for suppressing the disorders were not feeble.

JOHNSON, ABRAM, died in Salem, Wayne County, Pennsylvania, April 11, 1881; he was born in Vermont in 1773, and was one hundred and eight years old at the time of his death. His father was a soldier in the Revolution, the family then residing near Lake Champlain. Abram enlisted as a private in the War of 1812, but his gallantry soon won him the promotion of a captaincy to a band of Oneida Indians, under the command of General Macomb. In the battle of Plattsburg he received severe wounds, of which one was a saber-cut from the lusty arm of a British soldier, which knocked him down. Fearing further injury, Johnson feigned death, and while in this disabled and apparently lifeless condition he was again wounded by another Briton, who bru-

tally thrust a bayonet into his knee. This last injury caused him such acute anguish that it required all the desperation of fear of capture and heroic nerve to sustain him in acting the rôle he had assumed as the only means of escaping captivity and death. At night, after the battle, his Indian soldiers found and carried him back to their camp. Oneida, an Indian maiden, and the daughter of a chief, took the wounded "white man" under her care, and tenderly nursed him back to health. While his bodily hurts were healed by this soft ministry, the hero's heart fell a victim to the dusky charms of Oneida's sixteen summers, and soon after the establishment of peace she became his wife. They resided in New York for a time, and subsequently in Sussex County, New Jersey, where Oneida fell ill, and desired to be taken home to her tribe to die. With all the pomp of Indian burial she was laid to rest among her people. Mr. Johnson returned to his native town, Salem, where he resided until his death. Misfortune in business and speculations reduced him to the sad condition of a pauper, dependent on the charity of the town; for, although entitled to a pension, he never claimed it. His mind was sound to the last, and his bodily activity was remarkable in one so old. His only daughter attached herself to the Oneida Indians, and married the son of a chief.

JONES, JOHN B., born in Fairfield District, South Carolina, December 23, 1834; died in Texas, July 19, 1881. He was the son of Colonel Henry Jones, a South Carolina planter, who emigrated to Texas in 1839. This family was among the pioneer settlers of that State. The subject of this sketch was sent to his native State to be educated, and graduated at Mount Zion Institute. On his return to Texas he embarked in the business of farming and stock-raising, which he pursued industriously and with marked success until the beginning of the civil war, when he entered the army as a private soldier in Colonel Terry's Texas Rangers. After serving with this regiment a month, he was appointed adjutant of the Fifteenth Texas Infantry, and remained in the Trans-Mississippi department throughout the war—serving in Texas, Arkansas, Louisiana, and Indian Territory. In most of the principal battles in this department Colonel Jones was actively engaged, and distinguished for coolness in council and gallantry on the field. In 1863 he was appointed adjutant-general of a brigade, with the rank of captain, and acted as such for Speight's, Pohnie's, and Harrison's brigades. In 1864 he was recommended for promotion to the office of major in his regiment, by Colonel Harrison, Generals Green, Polignac, Mouton, Taylor, and Kirby Smith, for gallantry in action. The appointment was made, but failed to reach him before the close of the war. After the end of hostilities, Colonel Jones traveled through Mexico and Brazil, seeking a home, but was dissatisfied and returned to

Texas. In 1868 he was elected to the State Legislature from the district composed of Navarro, Hill, Kaufman, and Ellis Counties, but was counted out by the Republican returning-board and did not take his seat. In May, 1874, he was appointed by Governor Coke major of the Frontier Battalion. He raised and took command of six companies of rangers, for operations on the frontier, and in this service he remained nearly five years. While in command of these rangers he had a number of Indian fights, and in one engagement he defeated one hundred and fifty warriors with only thirty-seven men. He also captured or dispersed many bands of outlaws and desperadoes, with which the Texan frontier was then infested. In several localities he with marvelous tact and coolness settled deadly feuds, and restored peace to the neighborhoods. Often, at night, alone in the vast wilderness of the frontier, he met by appointment the most desperate men, probably, in the world, and, by reasoning with them, caused their return to peaceful lives in their own homes. These outlaws were said to fear Colonel Jones more than any other man, and regarded him as the embodiment of courage, honor, and truth, so that his promises to them were relied on with implicit faith. In January, 1879, Governor Roberts appointed him Adjutant-General of the State, and this position he held at the time of his death, having conducted the office with a success and ability unsurpassed in the history of the State. General Jones was a prominent and honored mason, and in 1872 was Grand High Priest of the Grand Chapter of Royal Arch Masons of Texas. In 1878 he was appointed, by Governor Hubbard, one of the three commissioners to investigate the El Paso troubles with Mexico, two of these commissioners being officers appointed by the President of the United States, selected by the Government from the regular army. The difficulty was satisfactorily adjusted, and the services of General Jones were acknowledged to be of great value. Personally, he was distinguished for those high qualities that ennoble the life of a man, and shed a wholesome influence upon the society of which he is a member.

JUTE, the fiber of species of *Corchorus*, as *C. capsularis* and *C. olitorius*. The name is also applied to the plant. The genus *Corchorus* belongs to the order of *Tiliaceæ*, the best-known representative of which is the linden, or bass-wood tree. The species that furnish the fiber are annuals, natives of Asia, and grow to be about ten or twelve feet high. Young shoots of *Corchorus olitorius* are used as pot-herbs in Egypt and Syria, and are cultivated for that purpose. The fiber of jute is contained in the bark of the stems, which are cut when the blossoms begin to appear, and is separated after macerating the stems in water. It is between eight and twelve feet long, and has the general appearance of hemp, but is softer and more silky. It is adapted for manu-

facture into goods that are not to be much exposed to the weather. It is used principally for making gunny-bags, or coarse coffee-sacks; also for burlaps, cheap carpeting, matting, and for an imitation of false hair. The coarser and refuse parts of the fiber are made into paper-stock. During the year ending January 1, 1881, 56,606 bales of jute were imported into the United States, giving a total value, at the average price of from eighteen to twenty dollars a bale, of about a million dollars. The importation has not essentially increased for a considerable period, but has fluctuated greatly during the last ten years. Thus, it amounted in 1872 to 97,059 bales; in 1873, to 39,404 bales; in

JUTE (*CORCHORUS CAPSULARIS*).

1874, to 27,496 bales; in 1875, to 28,804 bales; in 1876, to 25,284 bales; in 1877, to 22,629 bales; in 1878, to 45,181 bales; and in 1879, to 74,215 bales. In England, the yearly consumption amounts to more than a million bales. The great inferiority in the amount of the material brought to the United States is partly due to the operation of the American tariff, which is so levied as to work a discrimination in favor of manufactured jute; and it is cheaper to import the yarn or the woven cloths from the mills at Dundee, Scotland, than to import raw jute, and spin and weave it here. The business of manufacturing jute is more prosperous in California than in the Atlantic States, for the raw fiber may be brought there directly from India at less charges for freight than rule at the Eastern ports, while the long land-carriage across the continent adds greatly to the expense of bringing the manufactured goods from England, so as partly to offset the discrimination effected by the tariff. Experiments in the cultivation of jute on the reclaimed marsh-lands of Louisiana have been attended with encouraging results. The returns from the efforts made show, according to statements that have been published in New Orleans, that

land just reclaimed from the marsh, and still matted with roots, can be at once seeded in jute; and that the plant will then make so vigorous a growth as to supplant all other vegetation. Mr. John Sloane, of the Dolphin Mills, who is engaged in the manufacture of jute, has represented, after his observations of experiments in growing the plant in the Southern States, that as good a product can be raised there as in India, but that difficulties arise in

securing a proper treatment of the plant after it is cut; so that it is hardly practicable, under the American system of labor and wages, to obtain a good fiber for an economical price. And in view of the difference between the rates of wages in the United States and in India, no hopeful prospect exists that American jute will be able to compete with the Indian product, until machinery has been devised and applied to take the place of manual labor.

K

KALNOKY, Count GUSTAV, the new Austrian Minister of Foreign Affairs, was born in 1832. He is descended from the Moravian branch of an old Hungarian family. He entered the army at an early age, but changed to the diplomatic service when twenty-two years old. He was successively *attaché* in Munich and Berlin, then counselor of legation in London, *chargé d'affaires* at the Holy See, and was finally appointed Ambassador at Stockholm, which position he resigned for that of Ambassador at St. Petersburg. When Baron Haymerle died, Count Kalnoky was barely mentioned as his successor. He was, however, finally selected, as his personal relations with the court of St. Petersburg were of such a friendly character that it was expected he would be able to bring about that political union between Austria and Russia which seemed to be, in view of the strong friendship existing between Germany and Austria, a natural consequence of the imperial meeting at Dantzic. As Count Kalnoky is firm in his convictions of the advantages of a union of the three empires, the Hungarians, who regard Russia as their hereditary enemy, and are opposed to a union of Austria and Russia, are but little pleased with his appointment. Count Kalnoky is the twentieth Minister of Foreign Affairs since Prince Kaunitz.

KANSAS. The presidential vote in 1880 was as follows: For the Garfield electors, 121,549; Hancock electors, 59,801; Weaver electors, 19,851; Dow, 25. Only local elections occurred during the present year. The Legislature, consisting of 37 Republicans and 3 Opposition in the Senate, and 112 Republicans and 13 Opposition in the House, met on the 11th of January, and remained in session until March. An act for the protection of cattle against contagious disease, passed at this session, punishes with fine and imprisonment any person or persons who shall drive or cause to be driven into or through any county in the State, any cattle having a disease known as Texas, splenic, or Spanish fever. The public officers are required to take possession of any cattle so diseased. It is provided that, in the trial of any person or persons charged with the violation of any of the provisions of this act, proof that the cattle, which such person or persons are charged

with driving, are wild and of undomesticated habits, shall be taken as *prima facie* evidence that said cattle are diseased with the disease known as Texas, splenic, or Spanish fever.

Any person or persons who shall drive or cause to be driven into or through any county in this State, any of the cattle mentioned in section 1 of this act, in violation of this act, shall be liable to the party injured for all damages that may arise from the communication of disease from the cattle so driven, to be recovered in civil action, and the party so injured shall have a lien upon the cattle so driven.

An act to provide for the organization and management of the State Reform School empowers courts of record and probate courts of the State to commit to the Reform School, first, any boy under sixteen years of age who may be liable to punishment by imprisonment under any existing law of the State, or any law that may be enacted and in force in the State; second, any boy under sixteen years of age, with the consent of his parent or guardian, against whom any charge of committing any crime or misdemeanor shall have been made, the punishment of which, on conviction, would be confinement in jail or prison; third, any boy under sixteen years of age who is incorrigible, and habitually disregards the commands of his father or mother or guardian, and who leads a vagrant life, or resorts to immoral places or practices, and neglects and refuses to perform labor suitable to his years and condition, and to attend school.

It provides that every boy committed to the Reform School shall remain until he is twenty-one years of age, unless sooner discharged, or bound as an apprentice; but no boy shall be retained after the superintendent shall have reported him fully reformed; and whenever any boy shall be discharged therefrom as reformed, or as having arrived at the age of twenty-one years, such discharge shall be a full and complete release from all penalties and disabilities which may have been created by such sentence.

The board of trustees shall have full power to place any boy committed as herein described, during his minority, at such employment, and cause him to be instructed in such branches of useful knowledge, as may be suitable to his years and capacity, as they may see fit; and

they may, with the consent of any such boy, bind him out as an apprentice during his minority, or for a shorter period, to learn such trade and employment as in their judgment will tend to his future benefit; and the president of the board shall for such purpose have power to execute and deliver on behalf of said board indentures of apprenticeship for any such boy, and such indentures shall have the same force and effect as other indentures of apprenticeship under the laws of the State, and be filed and kept among the records of the Reform School, and it shall not be necessary to record or file them elsewhere.

Another act provides that upon the receipt of any money by the State Treasurer from the United States, in payment of the claims of the State, for which State bonds have been issued, it shall be the duty of the State Treasurer to place the amount or amounts so received to the credit of the sinking fund, for the final redemption of the State bonds so issued, save and except such sum as may be appropriated for the payment of Price raid claims.

An act to provide revenue for the fiscal years ending June 30, 1882, and June 30, 1883, declares that for the purpose of raising revenue to defray current expenses of the State government and to pay the interest on bonds of the State, and create a sinking fund for the redemption of bonds, there is hereby levied, and the proper officers shall collect a tax, upon all property in the State subject to taxation, as follows: For current expenses for the fiscal year ending June 30, 1882, four mills, and for the fiscal year ending June 30, 1883, three and a half mills; for continuance of work on State House, one half of one mill on the dollar each year; for the payment of interest, four tenths of one mill on the dollar each year; for the sinking fund, one tenth of one mill on the dollar for each year.

An act was also passed creating the county of St. John, and defining the boundary thereof; and defining the boundaries of the counties of Sheridan, Thomas, Gove, Wallace, Lane, and Gray.

Another act establishes a State road from the penitentiary, in Leavenworth County, to Rose-dale, in Wyandotte County.

Several bills were introduced, designed to enforce the prohibitory amendment to the Constitution. They resulted in the passage of an act to prohibit the manufacture and sale of intoxicating liquors, except for medical, scientific, and mechanical purposes, and to regulate the manufacture and sale thereof for such excepted purposes, the principal provisions of which are as follows:

SECTION 1. Any person or persons who shall manufacture, sell, or barter any spirituous, malt, vinous, fermented, or other intoxicating liquors, shall be guilty of misdemeanor, and punished as hereinafter provided: *Provided, however,* That such liquors may be sold for medical, scientific, and mechanical purposes, as provided in this act.

SEC. 2. It shall be unlawful for any person or per-

sons to sell or barter, for medical, scientific, or mechanical purposes, any malt, vinous, spirituous, fermented, or other intoxicating liquors, without first having procured a druggist's permit therefor from the probate judge of the county wherein such druggist may at the time be doing business; and such probate judge is hereby authorized, in his discretion, to grant a druggist's permit, for the period of one year, to any person of good moral character who is lawfully and in good faith engaged in the business of a druggist in his county, and who, in his judgment, can be intrusted with the responsibility of selling said liquors for the purposes aforesaid, in the manner hereinafter provided. In order to obtain a druggist's permit under this act, the applicant therefor shall present to the probate judge of the county wherein such person is engaged in business, a petition, signed by at least twelve citizens of the township or city wherein such business is located, certifying that the applicant is a person of good moral character, and lawfully engaged in the business of a druggist. He shall also file with such petition a good and sufficient bond to the State of Kansas. . . .

SEC. 3. Any physician, who is regularly engaged in the practice of his profession as a business, and who, in cases of actual sickness, shall deem any of the liquors mentioned in the first section of this act necessary for the health of his patient, may give such patient a written or printed prescription therefor. But no such prescription shall be made or given, except in case of actual sickness, and when, in the judgment of such physician, the use of intoxicating liquor is necessary as a remedy. Whenever, in the treatment of a minor, it shall be necessary to use intoxicating liquor as a remedy, the same shall be procured by his parent, or guardian, or some other person of full age, to whom such physician may deliver a prescription for that purpose. Every physician, before making any prescription for intoxicating liquor, shall make and file with the probate judge of the county wherein he may practice his profession, an affidavit before some officer of the county, authorized to administer oaths, in substance as follows:

STATE OF KANSAS, COUNTY OF —, SS.

I, A — B —, do solemnly swear that I am a practicing physician of the State of Kansas, residing in the county of —, in said State, and I do further solemnly swear that I will not prescribe intoxicating liquors of any kind for any person or persons whomsoever, unless in case of actual sickness, and when the same is necessary for the health of the patient; that I will in all things faithfully keep, observe, and perform all the requirements and conditions of the laws of Kansas regulating the sale and use of intoxicating liquors. So help me God.

(Signed) —

Sworn to before me, and subscribed in my presence, this — day of —, A. D. 18—.

And such affidavit shall be renewed and filed at the expiration of each five years of said physician's practice. . . .

SEC. 4. Any druggist having a permit to sell intoxicating liquors under the provisions of this act may sell for medical purposes only upon the written or printed prescription of a practicing physician, duly signed by such physician, and who has made and filed the affidavit mentioned in the preceding section; and for scientific and mechanical purposes only upon a written or printed application, which shall be dated, and shall set forth the name of the applicant, his residence and occupation, the quantity and kind of liquor required, and the purpose for which it is required, and shall have appended thereto an affidavit by the applicant, made before some officer authorized to administer oaths in his county, that the statements contained in such application are true; and all such applications shall be retained by the druggist selling thereon, and at the end of every thirty days, or sooner, shall be by him filed in the probate court out of which

his permit issued, where they shall be safely kept for the period of two years from the date of the filing of each: . . . *Provided, however,* That no sales of intoxicating liquors shall be made by any such druggist, knowingly, to any minor in any case, except upon prescription for medical purposes, as in this act provided: . . . *Provided,* That any druggist having a permit to sell intoxicating liquors under this act may sell such liquors in quantities not less than one gallon to any other druggist having a like permit.

SEC. 5. No person shall manufacture or assist in the manufacture of intoxicating liquors in this State except for medical, scientific, and mechanical purposes. Any person or persons desiring to manufacture any of the liquors mentioned in section 1 of this act for medical, scientific, and mechanical purposes, shall present to the probate judge of the county wherein such business is proposed to be carried on, a petition asking a permit for such purpose, setting forth the name of the applicant, the place where it is desired to carry on such business, and the kind of liquor to be manufactured. Such petition shall have appended thereto a certificate signed by at least twelve citizens of the township or city where such business is sought to be established, certifying that such applicant is a person of good moral character, temperate in his habits, and a proper person to manufacture and sell intoxicating liquors. Such applicant shall file with said petition a bond to the State of Kansas in the sum of ten thousand dollars, conditioned that, for any violation of the provisions of this act, said bond shall be forfeited. Such bond shall be signed by said applicant or applicants as principal or principals, and by at least three sureties, who shall justify under oath in the sum of seven thousand dollars each, and who shall be of the number signing said petition. The probate judge shall consider such petition and bond, and if satisfied that such petition is true, and that the bond is sufficient, may in his discretion grant a permit to manufacture intoxicating liquors for medical, scientific, and mechanical purposes. . . . Such manufacturer shall sell the liquor so manufactured only for medical, scientific, and mechanical purposes, and only in original packages. He shall not sell said liquors for medical purposes except to druggists who at the time of such sale shall be duly authorized to sell intoxicating liquors as provided in this act; and he shall sell such liquors to no other person or persons, associations or corporations, except for scientific and mechanical purposes, and then only in quantities not less than five gallons.

SEC. 6. All sales made by such manufacturer shall be upon a written or printed application, setting forth the name, occupation, and residence of the applicant, the quantity and kind of liquors wanted, and for what purpose; and all such applications shall be verified by the affidavit of the applicant, made before some officers in the county having authority to administer oaths, that the statements in said application are true. Such manufacturer shall file all such applications in the probate court of the county wherein the applicant resides, within thirty days after receiving the same, where they shall be kept on file for two years from the date of such filing. Any rectification or adulteration of intoxicating liquors shall be considered manufacturing under this act. . . .

SEC. 13. All places where intoxicating liquors are manufactured, sold, bartered, or given away in violation of any of the provisions of this act, or where intoxicating liquors are kept for sale, barter, or use, in violation of this act, are hereby declared to be common nuisances. . . .

SEC. 14. Every person who shall, by the sale, barter, or gift of intoxicating liquors, cause the intoxication of any other person or persons, shall be liable for, and compelled to pay, a reasonable compensation to any person who may take charge of, and provide for, such intoxicated person, and five dollars per day in addition thereto for every day such intoxicated person shall be kept in consequence of such intoxication, to be recovered by civil action in any court having jurisdiction.

SEC. 15. Every wife, child, parent, guardian, or employer, or other person, who shall be injured in person or property, or means of support, by any intoxicated person, or in consequence of intoxication, habitual or otherwise, of any person, such wife, child, parent, or guardian shall have a right of action, in his or her own name, against any person who shall, by selling, bartering, or giving intoxicating liquors, have caused the intoxication of such person, for all damages actually sustained, as well as for exemplary damages; and a married woman shall have the right to bring suits, prosecute and control the same, and the amount recovered, the same as if unmarried; and all damages recovered by a minor under this act shall be paid either to such minor, or to his or her parents, guardian, or next friend, as the court shall direct; and all suits for damages under this act shall be by civil action in any of the courts of this State having jurisdiction thereof.

SEC. 17. The giving away of intoxicating liquor, or any shifts or device to evade the provisions of this act, shall be deemed an unlawful selling within the provisions of this act.

Manufacturing permits continue in force for five years. Violations of the act are punished by fine or imprisonment.

An act passed at this session provides that "the County Superintendent of Public Instruction in counties containing one thousand and not more than twelve hundred persons between the ages of five and twenty-one years shall receive four hundred dollars per annum; in counties having a school population of from twelve hundred to fifteen hundred, he shall receive five hundred dollars per annum; and in counties containing more than fifteen hundred persons of school age, he shall receive five hundred dollars, and twenty dollars for each additional one hundred such persons per annum. In counties having a school population of less than one thousand, the County Superintendent shall receive three dollars for each day actually and necessarily employed in the discharge of the duties of his office, for a number of days not to exceed one hundred in one year, which compensation shall be payable quarterly, on the order of the Board of County Commissioners: *Provided,* That no county superintendent shall receive to exceed one thousand dollars per annum; and that, in determining the salaries of county superintendents, the school population of cities of the first and second class shall not be included." All superintendents receiving over six hundred dollars per annum are required to devote their entire time to the duties of their offices.

The State was reapportioned for Senators and Representatives, but no law was passed providing for a congressional reapportionment. The representation of the State will be increased from three to six under any act likely to pass Congress. According to the census of 1880, but six States raised more corn than Kansas; they were Illinois, Indiana, Iowa, Missouri, Ohio, and Minnesota. Only nine States—to wit, California, Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Ohio, and Pennsylvania—were ahead of Kansas on wheat.

The production of corn, wheat, and oats, for the year 1880, by counties, was as follows:

COUNTIES.	Indian corn.	Oats.	Wheat.
	Bushels.	Bushels.	Bushels.

The report of the State Board of Agriculture for 1881 shows that the total number of horses in the State for the year was 383,815; previous year, 367,589; increase, 16,226. Mules and asses, 58,780; previous year, 58,303; increase, 477. Milch-cows for the year, 406,706; previous year, 366,640; increase, 40,066. Other cattle for the year, 839,751; previous year, 748,672; increase, 81,079. Sheep, 806,323; previous year, 426,492; increase, 379,831.

Cheese made in factories for the year, 518,549 pounds; previous year, 573,346; a decrease of 54,797 pounds. Butter made in factories, 220,923 pounds; previous year, 133,101 pounds; an increase of 154,199 pounds. Cheese made in families for the year, 187,933 pounds; previous year, 133,101 pounds; an increase of 54,832 pounds. Butter made in families, 20,350,853 pounds; previous year, 16,611,315; increase, 3,739,538 pounds.

The total value of the products of the twenty-two field-crops raised in 1881 is \$81,910,439, or more than 30 per cent greater than in any previous year in the history of the State. The two that contribute the largest share of this total are wheat and corn; the former making \$21,705,205.80, and the latter \$44,859,903.29.

In production, average yields were not so large as in 1880, but the increased price of farm products makes the product of this year much more valuable.

The yield of wheat (winter and spring) was 20,479,689 bushels; corn, 80,760,542 bushels; of oats, 9,900,768 bushels were raised, and are valued at \$3,855,749.77; Irish potatoes, 1,854,140 bushels, with a value of \$2,710,377.50. The hay-crop, consisting of millet, Hungarian, timothy, clover, and prairie, aggregated 2,092,007 tons, with a value of \$11,894,594.98.

Of the minor crops, the following products and values are given: rye, 986,508 bushels—\$735,553.27; barley, 110,125 bushels—\$87,528.80; buckwheat, 58,621 bushels—\$43,965.75; sweet-potatoes, 201,062 bushels—\$292,842.55; sorghum, 3,899,440 gallons—\$1,745,871.45; castor-beans, 392,549 bushels—\$497,378.13; cotton, 388,070 pounds—\$38,805.30; flax-seed, 1,184,445 bushels—\$1,357,943.61; hemp, 629,160 pounds—\$44,041.20; tobacco, 797,829 pounds—\$79,782; broom-corn, 32,961,150 pounds—\$1,480,115.75; rice-corn, 520,534 bushels—\$314,787.12; and pearl-millet, 30,176 tons—\$165,863.

The value of property subject to taxation is \$284,688,955.05, being \$307.51 per capita.

The increase in the value of live-stock over last year is \$6,952,504.50; produce of live-stock during the year, \$21,682,888.25; value of honey and wax produced, \$22,210.25; products of orchards and vineyards, \$1,882,364.68.

There were eight counties that this year harvested over 500,000 bushels of wheat, viz.: McPherson, 1,337,174; Saline, 1,160,705; Sedgwick, 1,085,117; Dickinson, 926,226; Sumner, 862,728; Cowley, 702,144; Barton, 670,720;

and Harvey, 660,935. Seven counties raised more than 400,000 bushels, viz.: Marion, 495,729; Ottawa, 481,280; Reno, 470,160; Rice, 428,520; Cherokee, 419,500; Labette, 405,080; and Lincoln, 401,555.

Forty-two counties raised over 1,000,000 bushels of corn each, viz.: Sedgwick, 3,206,700; Sumner, 3,187,380; Butler, 2,988,420; Cowley, 2,457,575; Jewell, 2,414,680; Brown, 2,385,050; Osage, 1,965,572; Nemaha, 1,939,756; Miami, 1,923,138; Lyon, 1,917,702; Washington, 1,835,640; Republic, 1,806,340; Labette, 1,693,098; Marshall, 1,692,140; Franklin, 1,621,906; Wilson, 1,582,175; Doniphan, 1,510,560; Linn, 1,498,554; Bourbon, 1,498,020; McPherson, 1,492,942; Montgomery, 1,481,384; Smith, 1,393,616; Coffey, 1,338,736; Shawnee, 1,292,180; Johnson, 1,257,718; Harvey, 1,158,027; Dickinson, 1,157,536; Potawatomi, 1,143,632; Greenwood, 1,129,625; Anderson, 1,115,350; Leavenworth, 1,109,198; Crawford, 1,094,475; Cherokee, 1,086,528; Cloud, 1,077,835; Douglas, 1,075,225; Atchison, 1,075,220; Mitchell, 1,064,258; Clay, 1,063,140; Neosho, 1,050,624; Marion, 1,027,532; Rice, 1,015,760; and Reno, 1,006,450.

While the long-continued dry weather and the armies of chinch-bugs did immense damage to the crops of the State during 1881, yet the value of \$122,450,406.95 was divided among the farmers.

The permanent school fund on hand or invested, drawing interest, amounted in 1880 to \$2,297,590. The approximate value of the total school fund of the State, reckoning lands at the average price they have so far sold for, is \$11,815,519.20.

The following school statistics are for the year 1881: Number of organized school districts in the State, 6,322, an increase over 1880 of 188; total male children between five and twenty-one years of age, 177,476; total female children of the same ages, 169,316; whole number of children of school age, 346,792, an increase over 1880 of 6,145; total school enrollment, 249,034; total school attendance, 139,776. Total number of teachers in the State, 8,208; total number of male teachers, 3,544; total number of female teachers, 4,664; total average monthly salary paid male teachers in the State, \$30.21; do., female teachers, \$23.77. Average number of weeks of school within the year per district, 23.7; total number of certificates issued within the year, 7,435.

The State and municipal indebtedness in 1880 was as follows:

State bonds outstanding.....	\$1,181,975
County bonds outstanding.....	7,389,666
County warrants.....	340,228
Township bonds.....	2,223,579
Township warrants.....	36,476
City bonds.....	1,921,478
City warrants.....	95,089
School-district bonds.....	2,012,707
School orders.....	29,151
Total State and municipal debt.....	\$15,180,579

The State has 80 organized counties, 67 of which have railroads. Total miles of main-

track of railroad in Kansas, 3,478.36; average assessed value per mile, \$5,149.82; total value of main-track, \$17,912,943. Total miles of side-track, 274.75; average assessed value per mile of side-track, \$2,000; total value of side-track, \$551,750. Assessed value per mile of rolling-stock, \$892.10; total value of rolling-stock, \$3,103,045.89. Assessed value per mile of tools and materials, \$138.04; total value of tools and materials, etc., \$480,160.70. Assessed value of buildings, \$624,100. Total valuation of all property, \$22,671,999.59. Average valuation per mile upon all said property inclusive, \$6,578.01. There were built in the State, between March 1, 1880, and March 1, 1881, 374.15 miles. The valuation of railroad property is a little over one eighth of the total taxable valuation of the State.

In February the Supreme Court rendered a decision holding that the prohibitory amendment had been legally adopted. In June the same court rendered an important decision in several cases brought to test the force and scope of the liquor law above set forth. The following are the points of the decision:

1. The Legislature has the power, under the Constitution, to cast upon the person holding the office of judge of the probate court the duty of issuing permits or licenses for the sale of liquor, as provided in chapter 128 of the laws of 1881.

2. Said chapter 128, so far as it purports to regulate the sale of liquor for medical and other purposes, is not in conflict with the Constitution, because it restricts the right to sell to druggists.

3. While, in order to determine the true scope and meaning of a statute, its letter is to be first examined and considered, yet courts should also have regard to the evil sought to be remedied, for that which is within the letter, though not within the spirit of the statute, is not, in legal contemplation, a part of it.

4. The evil sought to be remedied by said chapter 128 is the use of intoxicating liquors as a beverage. This purpose interprets the law.

5. Whatever is generally and popularly known as intoxicating liquor, such as whisky, brandy, gin, etc., is within the prohibitions and regulations of the statute, and may be so declared as matter of law by the courts.

6. Whatever, on the other hand, is generally and popularly known as medicine, an article for the toilet, or for culinary purposes, recognized, and the formula for its preparation prescribed, in the United States Dispensatory, or like standard authority, and not among the liquors ordinarily used as intoxicating beverages—such as tincture of gentian, paregoric, bay-rum, cologne, essence of lemon, etc.—is without the statute, and may be so declared as matter of law by the courts, and this notwithstanding such articles contain alcohol, and in fact and as charged may produce intoxication.

7. As to articles intermediate these two classes, articles not known to the United States Dispensatory or other similar standard authority, compounds of intoxicating liquors with other ingredients, whether put up upon a single prescription and for a single case, or compounded upon a given formula and sold under a specific name as bitters, cordials, tonics, etc., whether they are within or without the statute, is a question of fact for a jury and not of law for the court. The rule or test is this: If the compound or preparation be such that the distinctive character and effect of intoxicating liquor is gone, that its use as an intoxicating beverage is practically impossible by reason of the other ingredients, then it is outside the statute. But if, on the other hand, the intoxicating liquor remain

as a distinctive force in the compound, and such compound is reasonably liable to be used as an intoxicating beverage, then it is within the statute.

In 1879 the House of Representatives consisted of 129 members—four more than are permitted by the Constitution of the State—four of which members, to wit, the representatives from Rooks, Rush, Harper, and Barbour Counties, were not, under the Constitution and laws, entitled to seats in the House of Representatives as members. An act was passed that year by the Legislature, but only by the assistance of the votes of those four members, and, except for their votes, this act would not have received a constitutional majority of the votes of the House; and, not counting their votes, the act did not receive a constitutional majority. The Supreme Court now holds that

the votes of those four members should not be counted, and therefore that the act must be considered as not having passed the House of Representatives, and as void.

The total product of coal, according to the census of 1880, was 771,142 tons. The following statement gives the total amount of taxes paid in the State on the assessment of 1880 for all purposes:

State taxes.....	\$586,515
County taxes.....	2,053,752
City taxes.....	861,187
Township taxes.....	564,329
School-district taxes.....	1,519,981
Total taxes paid.....	\$5,691,244

The following table shows the population of the State by counties, as finally returned by the census of 1880, and also as compared with the census returns of 1870:

KENTUCKY. The presidential vote in 1880 was as follows: for the Hancock electors, 149,068; Garfield electors, 106,306; Weaver, 11,499; Dow, 258. At the August election of 1881 there was no organized opposition to the re-election of James W. Tate, Democrat, for State Treasurer. He received 115,520 votes, against 725 for all others. The Legislature consists of 29 Democrats and 9 Republicans in the Senate, and in the House of 73 Democrats, 21 Republicans, 4 Greenbackers, and 2 Independents. In the third appellate district, consisting of the counties of Adair, Allen, Barren, Breckinridge, Bullitt, Cumberland, Green, Hardin, Hart, Jefferson, Larue, Marion, Meade, Metcalfe, Monroe, Nelson, Oldham, Shelby, Spencer, Taylor, and Washington, Joseph H.

Lewis was elected judge of the Court of Appeals, to fill a vacancy caused by the death of Judge Martin H. Cofer, by a vote of 22,051 against 11,207 for T. T. Alexander. At the same election a vote was taken on the question of calling a constitutional convention. The number of votes cast in the affirmative was not a majority of the citizens of the State entitled to vote for representatives, and the proposition was defeated. The number of legal voters is 367,163, of whom 312,521 are white and 54,642 colored. There is a general feeling in the State that a revision of the Constitution is necessary, but the above and other constitutional provisions render the calling of a convention well-nigh impossible. A proposition to call a convention was submitted to the peo-

ple in 1879, and failed for a like reason, though it received 124,191 votes.

Besides the fact that all voters who absent themselves from the polls, or fail to record their votes either way, are counted against the convention, the present Constitution throws other impediments in the way of changes of the organic law. From the time the first step is taken, six or seven years are required to accomplish a change. A law is passed to authorize the taking of a vote, say, in 1879, resulting in a majority at the polls in 1881; then the Legislature is directed to order another election in 1883, which, if successful, makes it mandatory to provide for the election of delegates to a convention in 1884. The convention must meet three months after the election of its members.

In view of these difficulties a so-called "sovereignty" convention, or convention called irrespective of the Constitution, and representing the people in their primary or sovereign capacity, has found advocates. At a public meeting in Louisville, on the 14th of October, a State Prohibition party was organized, and the following platform adopted:

Whereas, The evil of intemperance is the acknowledged prevailing vice of this country, and experience teaching us the important lesson that a country conscious of its vices, clinging to its vices, refusing to give up its vices, must perish by its vices, and believing that there are but two remedies for the evil, one by a political power through a political party pledged to this end, and the other by the judgments of Almighty God; and,

Whereas, Old political parties have for years ignored the temperance question—ay, more, have clasped hands over the licensed liquor-traffic; therefore, be it

Resolved, 1. We declare in favor of the final prohibition of the manufacture and sale of intoxicating liquors, both in State and nation.

2. It is neither right nor politic for the State to furnish legal protection to any traffic or system which tends to waste the resources, to corrupt social habits, and to destroy the health and lives of the people. That the importation, manufacture, and sale of intoxicating beverages are proved to be inimical to the true interest of individual, home, community, and State, and destructive to the welfare of society, and ought therefore to be classed among the crimes to be prohibited.

3. That we arraign the Republican party, which has been in continuous power for twenty years, as being false to duty, as false to the loudly proclaimed principles of equal justice to all and special favors to none, and protection to the weak and defenseless, and for being so insensible to the misery which the trade in liquor has constantly inflicted upon the industry, trade, commerce, and social happiness of the people.

4. We arraign the Democratic party as unfaithful and unworthy of reliance on this question, for, although not clothed in power, but occupying the relation of an opposition party during twenty years past, strong in numbers and organization, it has allied itself with liquor-trafficers.

5. That we believe the main issues which brought these parties into power are dead, and hereby renounce all connection with old parties, full of dead issues, and declare for a new one, full of living virtues.

6. We denounce the present free-school system of Kentucky as not sufficient to meet the ends of liberal education, and demand such legislation as is necessary for the proper education of our children.

7. Since our State has empowered women with the

right of suffrage in the election of school trustees, we favor the extension of said rights to them in all matters relative to the liquor-traffic.

We cordially invite all voters, without regard to former party affiliation, to unite with us in the use of the ballot for the abolition of the drinking system under the authority of our national and State government, and the enforcement of the above-named measures, believing their adoption essential to our happiness and national prosperity.

The following resolution was also adopted:

Resolved, That we recommend that county and State tickets be placed before the people at every regular election, and it shall be the duty of every friend of the temperance cause, opposed to the drink-traffic, to support such ticket.

The Legislature convened on November 28th, and on December 16th adjourned to January 3, 1882, to give the members opportunity to attend the Atlanta Exposition, to which the General Assembly had been invited. No important legislation was perfected. On the 7th of December James B. Beck was re-elected United States Senator, receiving 101 votes, while John D. White, Republican, received 28 votes, and Charles W. Cook, Greenbacker, 4.

The amount of the various funds in the Treasury, October 10th, was as follows, viz.:

Revenue department.....	\$51,118 28
Sinking fund proper.....	168,954 27
School fund proper.....	23,896 86
Colored school fund.....	3,466 93
Total.....	\$247,346 34

The estimate of the late Auditor of the deficit to be met for the fiscal year following his retirement, and ending October 10, 1880, was \$679,912.35. The last General Assembly made temporary provision to meet his deficit by authorizing a transfer of surplus and a loan from the sinking fund to revenue proper of \$235,671.72. They also authorized the Governor, Auditor, and Treasurer to borrow \$500,000 on the credit of the State if in their judgment it should be found necessary. Of this amount \$300,000 was borrowed during the year 1880, and \$100,00 in 1881, making a total of \$635,671.72.

The sinking-fund debt has all been paid, and also \$100,000 of the borrowed money; leaving \$300,000 due on borrowed money, with a balance in the Treasury to the credit of revenue proper on 10th of October of \$51,118.28; leaving a deficit of \$248,881.72.

The receipts have steadily increased during the last two fiscal years. In the year just expired October 10th they about equaled the expenditures. The Auditor's estimate for the year ending October 10, 1882, is as follows, viz.:

Expenditures for the year ending October 10, 1882.....	\$1,457,650 00
Receipts.....	\$1,306,269 63
Add balance in Treasury October 10, 1881.....	51,118 28
	1,357,387 91
Deficit for the year.....	\$100,262 09
To which add bank loan.....	300,000 00
Total deficit October 10, 1882.....	\$400,262 09

This deficit (says the Governor) may be met by either increasing the tax or issuing bonds; but I do not think either to be advisable or necessary.

Although our present State tax is much lower than that of almost any other State in the Union, yet it is amply adequate to all our wants if property is assessed at anything like its real value. The State tax amounts to but forty-five cents on the hundred dollars, of which twenty cents go to the school fund, and five cents to the sinking fund, leaving only twenty cents of what is called revenue proper for the support and expenses of the State government for all purposes whatsoever.

A revision of our revenue laws, whereby a fair, just, and uniform assessment may be had, will, at the present rate of taxation, provide ample means to meet this deficit, and keep pace with the growing wants of the State for years to come. Our system of assessments is grossly defective. It answered very well so long as our State was sparsely settled by a purely agricultural people, but it is illy adapted to a State with large cities and growing towns, and an extent and variety of trade and traffic never dreamed of when these laws were enacted. A large amount of property is never reached by the assessor; that which is listed is neither fairly nor uniformly assessed; the descriptions will rarely ever serve to identify the property, and the assessments are often ridiculously low. It is a system which has been rejected by most of our sister States.

The bonded debt remains unchanged. There are still outstanding bonds to the amount of \$180,394. Of this amount \$6,394 is past due, and for many years has ceased to draw interest. To meet this the State has in the hands of the Treasurer \$168,954.27: 406 shares of Bank of Louisville stock quoted at \$39,179; stock in turnpike-roads grossly estimated worth \$500,000; making the total estimated resources \$708,133.27.

During the last session of the General Assembly the common-school laws of the State were thoroughly revised by the joint committee on education, aided by the suggestions of the Superintendent of Public Instruction. Certain important amendments were printed, adopted, and laid before the Legislature, but, owing to the press of the legislation in the House on pending matters at the close of the session, no final action was taken.

The Agricultural and Mechanical College of Kentucky closed the session of 1879-'80, the last preceding the constitution of its present board, with one hundred and thirty-seven students. The first year under the new organization closed with two hundred and thirty-four. Its matriculation list on November 9th was two hundred and forty-eight.

The new board of trustees, in reorganizing the college, constituted the Normal School as required by act of the Legislature, and, in order to provide instruction in Latin for those teachers who wished to add some classical learning to their other acquirements, added a classical professorship. They also established a professorship of Practical Mechanics, and a professorship of Agriculture, Horticulture, and Economic Botany. The institution, thus enlarged in the direction required by the Legislature, and in the two essential elements of agriculture and practical mechanics, is fitted to accomplish in the future a work which, during its former connection,

it was never prepared to do. It now has the following professorships established to carry out the idea of scientific, technical, and industrial education, viz.: professorship of Elementary and Practical Chemistry, professorship of Mathematics, professorship of Civil Engineering, professorship of Botany, Comparative Anatomy, Zoölogy, and Geology; professorship of Agriculture, Horticulture, and Economic Botany; professorship of Practical Mechanics and Drawing, and professorship of Agricultural Chemistry. In addition to these departments, there are other subjects closely related thereto, for which no professorships have yet been created, but which are taught by the professors who have these several scientific departments in charge. These, with professorships of Mental and Moral Philosophy, Civil History, Modern Languages, English Language and Literature, Ancient Languages, and the two adjunct departments of Theory and Practice of Teaching, and a business course, comprising book-keeping and commercial law, make up the several courses of study in the State College.

The Normal School has achieved a fair measure of success during its existence. A large number of pupils from various parts of the State have availed themselves of the advantages afforded by normal instruction proper, and by free access to the other departments of the college. The college-grounds, given by the city of Lexington, contain fifty-two acres, valued at \$25,000, upon which new buildings are now in process of erection at a cost of \$85,000, toward which the city of Lexington and county of Fayette contributed \$54,000.

The important work of making a geological and topographical survey of the State has made favorable progress. Several counties hitherto unexplored have been accurately mapped, and positions and value of the mineral deposits determined. Important discoveries of the existence of a coking-coal of superior quality, now greatly in demand for the manufacture of iron, have been made, and the position of coal traced over a wide area. The publication of these results has greatly stimulated the demand for railways in portions of the State destitute of such means of transportation, and convinced capitalists that it will be a profitable investment to build roads penetrating those regions. Although the Bureau of Immigration has been organized less than eighteen months, more has been accomplished in making known abroad the vast resources of the State, and the real advantages offered by it to persons seeking homes, than in the previous history of the Commonwealth. The work and publications of this bureau have been so directed as to attract the most desirable class of immigrants, and already several thriving colonies, composed of farmers and skilled artisans, have been located.

The last Legislature abolished the lessee system with respect to convicts, and left the management of the Penitentiary and convicts,

to a great extent, to the control of the Commissioners of the Sinking Fund, who are the Governor, Secretary of State, Auditor, Attorney-General, and Treasurer.

There are now inside the walls of the Penitentiary 651 men, for whom the contractors pay an annual rent of \$25,375, less expense of State guards, etc., \$17,875, leaving a net income to the State of \$7,500. It is impossible to state the exact number of employes on railroad work, as it is constantly fluctuating between two and three hundred. The amount received is \$50 per head, and the net income to the State from the same may be safely estimated at \$10,000 per annum, making total net receipts of \$17,500. Under the lessee system, the Penitentiary was a constant drain upon the Treasury of the State.

The following is a comparative statement of the assessment of railroads in Kentucky for 1878-'81, showing the increase in the number of miles, and also the valuation:

YEARS.	Number of miles.	Total valuation.
1878.....	1,867,212	\$14,608,897 85
1879.....	1,895,282	15,304,294 35
1880.....	1,515,796	24,909,070 15
1881.....	1,533,596	32,075,212 01

There are 20,944 volumes in the State Library. The following is a summary of the taxable property of the State, excepting Fayette County:

OWNERS.	Value.	Tax.
White.....	\$841,577,523	\$1,554,177 73
Colored.....	2,950,236	13,411 06
Total.....	\$844,557,759	\$1,567,588 79

Adding Fayette County, as returned in 1880, the total valuation is \$856,475,134; tax, \$1,621,804.98.

The per capita for white common schools for the school year 1881-'82 is \$1.40; and the per capita for the colored common schools, 50 cents.

There are 1,063 idiots maintained by the State, exclusive of those in the Feeble-minded Institute. The counties having twenty and over are Bath, 22; Casey, 25; Clay, 24; Grayson, 20; Harlan, 20; Jackson, 21; Jefferson, 30; Knox, 33; Letcher, 20; Ohio, 22; Pulaski, 29; Wayne, 30; Whitley, 31. The following counties have none: Ballard, Carroll, Crittenden, Fayette, Fulton, McLean, and Union; while Boyd, Larue, Menifee, and Woodford have only one each. The State pays \$75 for the support of each of these idiots, or a total for the past year of \$77,805.27.

The internal revenue derived by the United States in six districts of the State is shown in the following table:

Second district.....	\$672,159 61
Fifth district.....	8,409,672 12
Sixth district.....	8,185,216 08
Seventh district.....	1,009,843 81
Eighth district.....	216,668 51
Ninth district.....	145,579 63
Total.....	\$3,719,144 21

The work of improving the navigation of the Kentucky and other rivers has been going on. Congress has recently appropriated \$325,000 for the Kentucky River; \$55,000 for the Big Sandy; \$37,000 for that portion of the Cumberland River flowing through Kentucky; \$5,000 for the Tradewater, and a small sum for the Licking.

The cereal productions of the State, according to the census, have been as follows:

YEARS.	INDIAN CORN.	Bushels.
1870.....	50,091,006
1880.....	73,977,529
Increase.....	23,886,523

YEARS.	WHEAT.	Bushels.
1870.....	5,728,704
1880.....	11,355,340
Increase.....	5,626,636

YEARS.	OATS.	Bushels.
1870.....	6,620,108
1880.....	4,552,968
Decrease.....	2,067,135

YEARS.	BARLEY.	Bushels.
1870.....	238,486
1880.....	487,031
Increase.....	248,546

YEARS.	RYE.	Bushels.
1870.....	1,108,933
1880.....	676,245
Decrease.....	432,688

YEARS.	BUCKWHEAT.	Bushels.
1870.....	3,443
1880.....	14,940
Increase.....	11,497

Kentucky is the first State in the yield of tobacco, producing in 1880 171,120,784 pounds, or 36 per cent of the entire product of the country.

It is stated that there are at present 58,000,000 gallons of whisky in store in the State. The yield of coal, according to the census of 1880, was 946,288 tons. The population of the principal cities and towns was as follows:

CITIES AND TOWNS.	Population.	CITIES AND TOWNS.	Population.
Louisville.....	123,645	Lebanon.....	2,054
Covington.....	29,720	Mayfield.....	1,833
Newport.....	20,433	Cynthiana.....	1,566
Lexington.....	16,656	Madisonville.....	1,544
Paducah.....	8,376	West Covington.....	1,526
Frankfort.....	6,958	Glasgow.....	1,512
Henderson.....	5,365	Augusta.....	1,250
Hopkinsville.....	4,229	Lancaster.....	1,234
Ashland.....	3,250	Cumberland.....	1,147
Danville.....	3,074	Columbus.....	1,139
Richmond.....	2,909	Vanceburg.....	1,095
Shelbyville.....	2,409	Cloverport.....	1,056
Winchester.....	2,275	Uniontown.....	1,015
Russellville.....	2,053		

The population of the State is 1,648,690, but as distributed among the several counties as shown by the returns of the census of 1880, and as compared with the returns of 1870, it is as follows:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.

L

LAND TENURE IN EUROPE. The land question is one of the most important of those which have occupied the attention of civilized nations during the present century. It grows in interest, and must continue so to do until there be a more general agreement as to the principles on which land ought to be held, and a more hearty recognition of the natural rights of all members of a nation or country freely to acquire possession and dispose of the land, which furnishes mankind with means of supporting life. In these United States the tenure of land is settled upon the broadest basis. There is nothing to prevent any man from purchasing land to any extent, or anywhere. He can sell as freely as he can buy, and there are no burdensome restrictions upon his course, such as exist in the older settled countries of Europe. He can also direct by will, subject, of course, to the laws of the country, the disposition of his real estate among his children (if he have any), or among any parties he may choose. In case he neglect to do this, the law steps in and divides his property among his natural heirs, i. e., his children or nearest relatives. But it is not so in Europe. The long prevalence of feudal rights and privileges, and the heavy burdens upon the common people in consequence, rendered the land question for

centuries a very grave and perplexing one. In the course of time it was certain to produce trouble which could not easily be removed, and to cause outbreaks of popular discontent and sense of ill usage. This was seen in France, where agrarian discontent led to the fierce excesses which marked the French Revolution. Feudal dues and privileges were abolished by the law of August 11, 1789, and two years later all landed property was declared free from burdens, excepting those recognized by law, and the proprietors were at full liberty to do as they liked with the land, and to sell its products wheresoever they thought fit. Royal edicts (1774-'76) had previously sanctioned the leading principles of this legislation, when Turgot was comptroller-general, and it seems probable that if they had been carried out, economic and social transformation in France would have been effected without the horrible strife and confusion which ensued. In Prussia, under the leading of that able minister, F. von Stein, the great change from the feudal organization to the modern state was accomplished in peace and quiet. No class in the country lost its self-respect, and there is no dismal record of blood and crime. According to the old law, land in Prussia might pass from hand to hand, but it must always remain

the possession of nobles, peasants, or citizens, as the case might be. When, under Frederick William III, the monarchy was greatly reduced by Napoleon's military successes, Stein undertook the important and difficult work of agrarian reform. Agriculture had of course suffered severely by the war, and Stein furnished help to the land-owners, who had been losers, by abolishing all limitation of the right of owning and alienating land. Personal serfdom was put an end to; but it was perplexing to know what to do with the peasantry, who were very poor and very wretched managers of affairs. A royal commission investigated the subject, and proposed several remedial measures. The most important of these were to allow each peasant to hold land, subject to certain dues; to refuse any further pecuniary help, and evict those unable to meet obligations; to withdraw permission to send cattle to graze in the royal forests; to commute into money payment in kind, and add it to the rent; to let one quarter of this remain as a permanent charge on the land, and the other three fourths to be redeemable in thirty years; and if any peasant was unable or unwilling to agree to this arrangement, to sell his holding and give him the proceeds as compensation. The interests of no less than 47,000 families were involved, and Minister Stein realized the gravity of the situation. He finally decided to continue the government subsidies for two years, in order to give the tenants time to repair their holdings. In 1817 Hardenberg framed a law by which, on all manorial estates, the peasant became the owner of his holding, and the lord was compensated by receiving in fee simple a third of the peasant's land, if the latter held by hereditary tenure, and one half if he did not. Subsequent land legislation in Prussia has been in the direction of helping the peasant to pay off his debt to the state, and the effect has been to create a peasant proprietary, and to help to abolish all monopolies and impediments to industry.

The fines, dues, and monopolies of the feudal system continued to exist throughout Germany and Austria long after Stein had cleared them away in Prussia. In the Austrian Empire the old organization remained in full vigor till 1848. Much dissatisfaction was felt and complaint made as to the working of this system, and the mode in which the laws were administered throughout Southern Germany, and, when the tempest of 1848 burst over Germany and Austria, it became necessary to sweep away the whole manorial organization. Under the rearrangement the peasant held his land under one of four different kinds of tenure, viz., *Erbrecht*, *Freistift*, *Leibrecht*, and *Neustift*. In the case of the first, when a tenant died his heir succeeded to the holding as a matter of right; but in the case of *Leibrecht* the lord might resume possession of the holding and add it to his domain on the death of the tenant. Those who held by *Freistift* occu-

pied their holdings at the will of the lord. The tenant might at any moment get notice to quit, but the lord was required to make suitable compensation. In the case of *Neustift* the right of occupation terminated if the manor changed hands. In practice all these holdings, no matter under which of the four tenures they were held, passed from father to son for many generations. The tenant gave the lord every year a certain proportion of his corn as well as of his non-cereal crops. As a proprietary arrangement this had become very cumbrous and inconvenient. Troubles and difficulties occurred, and there was a general desire for a simpler agrarian system. In order to satisfy this want, a law was passed offering adequate remuneration to any lords of manors who chose to renounce their feudal dues. The details are not important; but the main result has been to create a large number of peasant owners in fee simple, to simplify the title upon which land is held, and to introduce a system under which it may be bought and sold with the greatest facility in the open market.

The next great event in agrarian history of the century is the abolition of serfage in Russia. This institution, first legalized in 1592, was introduced into the Ukraine during the reign of Catharine II. More than once did it produce revolutionary movements, and there was a very dangerous outbreak in 1773. The Empress dared not offend the nobility, and the condition of the peasantry became worse and worse. Under the Emperors Paul, Alexander, and Nicholas, efforts were made toward emancipation; but it was not till the close of the Crimean War (1856) that the freeing of the serfs became a matter of prime necessity. There were three kinds of estates in Russia: those farmed by the proprietor himself, who took his dues in serf-labor; those on which the number of serfs was greater than the owner could employ, these being allowed to go and work where they pleased; and, finally, those which the proprietor did not farm at all. The serfs on these last were treated like the supernumeraries on the second class of estates, and the owner arranged that the commune should work his land. By the law of 1861 the serfs were declared personally free, and the communal land was separated from the rest of the estate. The Government gave its aid to the commune by advancing four fifths of the purchase-money, the peasants being required to pay the other fifth to the proprietors. Up to the beginning of 1875, sixty-three per cent of the dues were cleared by obligatory redemption; and up to that time 7,200,000 male serfs had made redemption contracts—that is, to pay the Government six tenths for forty-nine years over the sum advanced.

The decay of feudal society in most other European countries needs only brief statement. In Spain it was in reality destroyed by the Saracen conquest. Under Ferdinand and Isabella great land reforms were carried through,

and in 1486 it was decreed that the feudal dues should be reduced to a fixed sum, and serfage was abolished in Spain. Owing to other causes, the condition of the Spanish agriculturist became very hard to bear. Some grievances have been remedied, but chronic disturbance still exists to a greater or less degree. In the Italian Peninsula the condition of the cultivators of the soil was much the same as in the Frankish monarchy up to the twelfth century, when a great improvement began to take place. In the following century serfage was more or less done away with in the northern part of the peninsula. The city of Bologna set the example by abolishing serfage throughout its extensive territory in 1256, due care, however, being had for all proprietary rights. Treviso and Florence followed in a few years, and not long after it disappeared throughout Upper Italy. In Southern Italy matters were quite different. The peasantry of Naples and Sicily prospered under Mohammedan rule during the early portion of the middle ages, and Sicily had a much larger population in the eleventh century than it numbered in 1842. The Norman invasion produced a change, and a feudal system was imposed on Southern Italy, and pressed heavily on the people. It was only in this century, after long and bitter suffering, that they were set free by the soldiers of the Revolution.

In Scandinavian countries (see DENMARK), in Switzerland, in Holland, and in Belgium, the development of the land question has been in the same direction, and the practical result has been to make the cultivators of the soil the owners of it in most countries of Europe. In Russia, at this date, about one third of the land belongs to small communal proprietors; about one sixth is in the hands of large land-owners; and the remainder belongs to the state. In the extreme north and southeast the land (except the property of the state) is owned exclusively by peasants. In the east and beyond the Volga they own from seventy to ninety per cent, and in Central Russia from fifty to seventy per cent. In the south and west the land is about equally divided between the peasants and large proprietors; but in the Baltic and Polish provinces the latter own much the largest portion. Agriculture in Russia, according to the most reliable accounts, has made little or no progress for twenty years past. On the contrary, it seems to have declined. Everything appears to point in Russia to the concentration of wealth, and the creation of a proletariat. The communal property in land has not had the good effect, in the way and to the extent which was hoped, and land problems in Russia are forcing themselves upon the attention of all concerned in the right government and prosperity of the empire. Italy, also, as to this question, is in a sad condition. The trade in grain has come to an end, and the misery of the common people is said to be terrible, arising from destitution, and sickness in consequence. Heavy taxation, too, is contributing

to the ruin of the agriculturist, and emigration has assumed large proportions. France, likewise, shows signs of agrarian trouble. About one third of the soil is in the hands of small proprietors; the other two thirds are cultivated on a large scale. Farming in this latter does not seem to pay, for foreign competition (especially American) and high price of labor render cultivation of the land unprofitable. The condition of the small peasant proprietors is said to be very good where they cultivate the ground themselves. In Germany peasant proprietorship is not so well off as in France, seeing that nearly fifty per cent of small incomes goes in rates, taxes, and interest. It is asserted that, in some parts of Germany, from a quarter to a half of the peasant proprietors are on the verge of bankruptcy. As a general rule, it seems to be certain that in no part of Europe can competition be successfully carried on against the vast wheat-fields of the United States, and the European agriculturist is rarely flourishing, except where he can cultivate the vine, or grow hops, or tobacco, or olives, or beets (for sugar), or vegetables.

The land question in England is by no means a quiet one. Not only is the very unequal division of land complained of, but it is held to be a grievance that land is entailed or settled so as to prevent its being sold, leased, or improved, and thus subject to the free operation of the natural laws of supply and demand. Some want an independent working peasantry, with, at the same time, the landlord properly secured in his rights of property. Full freedom of contracts, liberty of use, rules of the market, and law of the exchange, are claimed for land as much as any other commodity. It is urged that land in England has high social and political bearings. The state is bound to foster and encourage the agricultural classes, and farmers, it is said, have deteriorated and need improvement in manners, intellectual force, etc. The Farmers' Alliance is working to gain possession of the land, so as to enjoy it and sell it as they choose. The aristocratic classes do not, of course, quite like this, and the question is by no means an easy one to settle. As regards Ireland, every one is aware how exceedingly difficult it is to find grounds of amicable settlement of the land question. A royal commission, it is urged, ought to be appointed, with powers to buy the estates of those willing to sell at a fixed number of years' purchase, with a view of establishing a peasant proprietary; and that all restrictions on the sale of land should be removed, and a cheap and expeditious mode of land transfer introduced. Very possibly such measures would prove beneficial. So far as anything has been done in the way of peasant proprietorship, it seems to work well and satisfactorily. It is claimed that what is wanted in Ireland is free play for the forces of economic law. And this can only be obtained, at least so far as appears, by a scheme which, without doing injustice to

any one, would make the farmers of Ireland, in large numbers, owners of their holdings, and which would give to those who had to continue tenants, fixity of tenure at a fixed rent, and, of course, as a natural consequence, the right of free sale. (See GREAT BRITAIN.)

LANE, JOSEPH, born December, 1801, in North Carolina; died April 19, 1881, in Oregon, aged eighty years. In 1802 his father settled in Kentucky, and in 1821 Mr. Joseph Lane became a resident of Indiana. His talents and ability were so marked that in one year after his settlement in the State he was sent to the Legislature, and, in one House or the other, continued to serve until 1846. He then resigned his seat in the State Senate, and at the head of an Indiana regiment went to the Mexican War. After a time he was appointed brigadier-general, and at the famous battle of Buena Vista commanded the left wing of the American army. After his recovery from a wound received in that battle, he returned to the army, and defeated Santa Anna at Huamantla, following up the victory shortly afterward with the capture of important posts. On the 22d of November, 1847, he took the town of Matamoros, with a quantity of military stores. At the end of the war he was brevetted major-general, and in August, 1848, was appointed by President Polk Governor of Oregon, from which office he was removed by President Taylor. On the admission of Oregon into the Union he was made United States Senator, and in 1860 was put on the same presidential ticket with John C. Breckenridge, being the nominee of one of the wings of the Democracy for Vice-President. His defeat ended his prominent political career. Though he bore so illustrious a part in the war with Mexico, the gratitude of his country was never manifested by a pension or other mark of sympathy, and only a year before his death he declined an invitation to attend a reunion of Mexican veterans, because he was too poor to make the journey. With the modest dignity of true self-reverence he accepted his obscure old age in the Oregon village, where he calmly passed away from the scenes and affairs amid which he had long endeavored to make his life useful to his fellow-men.

LAW, CONSTITUTIONAL: ITS RECENT PROGRESS. In no period of our history have more and greater constitutional questions of vital importance been adjudicated by the highest judicial tribunal of the nation than have recently been decided by the Supreme Court of the United States, in cases involving the relations existing between the States and the General Government. Most of these questions grew out of the constitutional and congressional enactments following the war, and involved issues raised before, during, and after the war. The post-war amendments to the Constitution made a radical change in the relations borne by the States to the General Government. They carved out a vast extent of State sovereignty,

and added it to Federal sovereignty. The power of Congress has thus been greatly enlarged, and that of the States correspondingly diminished. In the exercise of this power Congress has made extensive limitations upon State rights. The Supreme Court has frequently been called upon to determine the purport and validity of this legislation, and the meaning of the Constitution on questions of State and Federal sovereignty; and the doctrines it has affirmed, generally on a divided opinion of the judges, have greatly strengthened if not enlarged the sovereignty of the nation. Hence there has been in recent years a steady and extensive development of a central power, or a remarkable advance toward centralization, in our system of government. A striking illustration of this fact is afforded by a brief review of some of the most important constitutional doctrines recently affirmed by the Supreme Court.

The fourteenth amendment declares that "all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside." It then declares that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws." This enactment clearly limits the power of a State over its citizens, but in what respects the limitation operates, or how far it goes, is a vitally important question, on which the Supreme Court has divided in every case which has come before it under the amendment. In the Slaughter-House cases the majority of the court drew a distinction between the privileges and immunities of a citizen of the United States and those of a citizen of a State, and held that it was only the former which the States were prohibited from abridging. In *Strauder against West Virginia* (100 U. S. Reports, 306), the majority went further, and declared that the amendment "was designed to assure to the colored race the enjoyment of all the civil rights that under the law are enjoyed by white persons, and to give to that race the protection of the General Government in that enjoyment whenever it should be denied by the States. It not only gave citizenship and the privileges of citizenship to persons of color, but it denied to any State the power to withhold from them the equal protection of the laws, and authorized Congress to enforce its provisions by appropriate legislation." But what are the "civil rights" which the States may not withhold? Is it a civil right of a colored person to marry a white person, to attend a school for whites, to follow the same professions and callings followed by whites? The court has held that the privilege of practicing law in the courts of a State is not a right

secured by the amendment to a white woman, nor one which a State is prohibited from denying or abridging. May a State regulate the practice of law in its own courts on the ground of color as well as sex? The court has admitted that a State may exclude from the jury-box all persons above or under a certain age; may exclude women; may make property or intelligence qualifications; may make conviction of an offense a disqualification. May it exclude colored jurors as well as the old, the young, the poor, the ignorant, and females? In other words, is the privilege of sitting on a jury, or the right to be tried by a jury from which blacks are not excluded, a right which a State is prohibited by the fourteenth amendment from denying to a colored citizen?

This question was raised, elaborately discussed, and decided in the Virginia jury cases, which came up in 1879, and are reported in 100 U. S. Reports. The decision of the court was in favor of the power of the General Government, and against that of the States. It held that whether a colored or a white citizen was on trial, whether life, liberty, or property, either of black or white, was at stake, no State has a right to exclude negroes from the jury by reason of their color, or to make any color or race discrimination in the selection of jurors in State courts. The amendment, said Justice Strong, "ordains that no State shall deprive any person of life, liberty, or property without due process of law, or deny to any person within its jurisdiction the equal protection of the laws. What is that but declaring that the law in the States shall be the same for the black as for the white; that all persons, whether colored or white, shall stand equal before the laws of the States; and in regard to the colored race, for whose protection the amendment was primarily designed, that no discrimination shall be made against them by law because of their color? The words of the amendment, it is true, are prohibitory, but they contain a necessary implication of a positive immunity, or right, most valuable to the colored race—the right to exemption from unfriendly legislation against them distinctively as colored—exemption from legal discriminations, implying inferiority in civil society, lessening the security of their enjoyment of the rights which others enjoy, and discriminations which are steps toward reducing them to the condition of a subject race. . . . The very fact that colored people are singled out and expressly denied by a statute all right to participate in the administration of the law as jurors, because of their color, is practically a brand upon them affixed by the law, an assertion of their inferiority and a stimulant to that race prejudice which is an impediment to securing to individuals of the race that equal justice which the law aims to secure to all others."

From this doctrine Justices Field and Clifford dissented in elaborate opinions written by the former in the cases of Virginia against Rives,

and *ex parte* Virginia, reported in 100 U. S. Reports. From these opinions the following passages are given, as showing the views of the minority of the court:

Its first clause [of the fourteenth amendment] declared who are citizens of the United States and of the States. It thus removed from discussion the question which had previously been debated, and though decided, not settled, by the judgment in the Dred Scott case, whether descendants of persons brought to this country and sold as slaves were citizens within the meaning of the Constitution. It also recognized if it did not create a national citizenship, as contradistinguished from that of the States. But the privilege or the duty, whichever it may be called, of acting as a juror in the courts of the country is not an incident of citizenship. Women are citizens; so are the aged above sixty, and children in their minority; yet they are not allowed in Virginia to act as jurors. Though some of these are in all respects qualified for such service, no one will pretend that their exclusion by law from the jury-list impairs their rights as citizens.

The second clause of the first section of the amendment declares that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." In the Slaughter-House cases it was held by a majority of the court that this clause had reference only to privileges and immunities of citizens of the United States, as distinguished from those of citizens of the States, and therefore did not apply to those fundamental civil rights which belong to citizens of all free governments, such as the right to acquire and enjoy property and pursue happiness, subject only to such just restraints as might be prescribed for the general good. If this construction be correct, there can be no pretense that the privilege or duty of acting as a juror in a State court is within the inhibition of the clause. . . .

The third clause in the first section of the amendment declares that no State "shall deprive any person of life, liberty, or property without due process of law." It will not be contended that this clause confers upon the citizen any right to serve as a juror in the State courts. It exists in the Constitutions of nearly all the States, and is only an additional security against arbitrary deprivation of life and liberty, and arbitrary spoliation of property. It means that neither can be taken or the enjoyment thereof impaired, except in the course of the regular administration of the law in the established tribunals. The existence of this clause in the amendment is to me a persuasive argument that those who framed it never contemplated that the prohibition was to be enforced in any other way than through the judicial tribunals, as previous prohibitions upon the States had always been enforced. If Congress could, as an appropriate means to enforce the prohibition, prescribe criminal prosecutions against legislators, judges, and other officers of the States, it would be authorized to frame a vast portion of their laws. . . .

The fourth clause in the first section of the amendment declares that no State shall "deny to any person within its jurisdiction the equal protection of the laws." . . . The equality of the protection secured extends only to civil rights as distinguished from those which are political, or arise from the form of government and its mode of administration. . . . It secures to all persons their civil rights upon the same terms; but it leaves political rights, or such as arise from the form of government and its administration, as they stood previous to its adoption. It has no more reference to them than it has to social rights and duties, which do not rest upon any positive law, though they are more potential in controlling the intercourse of individuals. In the consideration of questions growing out of these amendments much confusion has arisen from a failure to distinguish between the civil and the political rights of citizens. Civil rights are absolute and personal. Political rights, on the other

hand, are conditioned and dependent upon the discretion of the elective or appointing power, whether that be the people acting through the ballot, or one of the departments of their government. The civil rights of the individual are never to be withheld, and may be always judicially enforced. The political rights which he may enjoy, such as holding office and discharging a public trust, are qualified because their possession depends on his fitness, to be adjudged by those whom society has clothed with the elective authority. The thirteenth and fourteenth amendments were designed to secure the civil rights of all persons, of every race, color, and condition; but they left to the States to determine to whom the possession of political powers should be intrusted.

The great change made since the war in the relations between the States and the General Government, and the extent of the power taken from State and given to Federal sovereignty, are nowhere more strikingly shown than by the interpretation given to the fourteenth amendment by the Supreme Court, in the case of *ex parte* Virginia, decided in 1879, and reported in 100 United States Reports. The case grew out of the indictment, in the United States District Court, of Judge Coles, a Virginia judge, on a charge of excluding blacks from the jury-lists made out by him. There was no State statute disqualifying colored jurors. The question raised was, whether Congress has any authority to punish a judicial officer of a State for his official acts. The court held that Congress has this power, and the opinion goes to the extent that the power extends to the punishment of any State officer for acts done in violation of Federal laws, though such acts may be in obedience to and required by State laws. The change thus wrought in our constitutional law may be illustrated by a comparison of this doctrine with that affirmed by the same court, in the case of the Commonwealth of Kentucky against Dennison, the Governor of Ohio, decided in 1860, and reported in 24 Howard's Reports. In that case the court held that neither Congress nor the Supreme Court of the United States had the power to compel the chief Executive of one State to deliver to the authorities of another a fugitive from justice. "Indeed, such a power," said Chief-Justice Taney, in delivering the opinion of the court, "would place every State under the control and domination of the General Government, even in the administration of its internal concerns." The enlarged powers which the court now holds to be in Congress are derived, in the opinion of the court, from that clause of the fourteenth amendment which declares that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, . . . nor deny to any person within its jurisdiction the equal protection of the law." As to the purpose and effect of this clause the court was divided in opinion. Two of its nine members maintained that the prohibition extended only to the Legislature, and applied only to legislation; and hence that it gave Congress no authority over the executive and judicial departments of a State. Jus-

tice Hunt did not sit in the case. The other six justices, constituting the majority of the court, held, in the language of Justice Strong, who wrote the opinion, that the prohibitions "have reference to the actions of the political body denominated a State, by whatever instruments or in whatever modes that action may be taken. A State acts by its Legislature, its Executive, or its judicial authorities. It can act in no other way. The constitutional provision, therefore, must mean that no agency of the State, or of the officers or agents by whom its powers are exerted, shall deny to any person within its jurisdiction the equal protection of the laws. Whoever, by virtue of public position under a State government, deprives another of property, life, or liberty, without due process of law, or denies or takes away the equal protection of the laws, violates the constitutional inhibition; and as he acts in the name and for the State, and is clothed with the State's power, his act is that of the State. This must be so, or the constitutional prohibition has no meaning. Then the State has clothed one of its agents with power to annul or to evade it" (*Ex parte* Virginia, 100 U. S. Reports, 346, 347.)

This view was combated by Justice Field, in a dissenting opinion, in which Justice Clifford concurred. "As the State," said Justice Field, "in the administration of its government, acts through its executive, legislative, and judicial departments, the inhibition applies to them. But the executive and judicial departments only construe and enforce the laws of the State; the inhibition, therefore, is in effect against passing and enforcing any laws which are designed to accomplish the ends forbidden. If an executive or judicial officer exercises powers with which he is not invested by law, and does unauthorized acts, the State is not responsible for them. The action of the judicial officer in such a case, where the rights of a citizen under the laws of the United States are disregarded, may be reviewed or corrected or reversed by this court. It can not be imputed to the State, so as to make it evident that she, in her sovereign or legislative capacity, denies the rights invaded, or refuses to allow their enforcement. It is merely the ordinary case of an erroneous ruling of an inferior tribunal. Nor can the unauthorized action of an executive officer, infringing upon the rights of the citizen, be taken as evidence of her intention or policy, so as to charge upon her a denial of such rights." (*Virginia against Rives*, 100 U. S. Reports, 333, 334.)

"Nothing, in my judgment, could have a greater tendency to destroy the independence and autonomy of the States, reduce them to a humiliating and degrading dependence upon the central Government, engender constant irritation, and destroy that domestic tranquillity which it was one of the objects of the Constitution to insure, than the doctrine asserted in this case that Congress can exercise coercive authority over judicial officers of the States in the dis-

charge of their duties under State laws. It will be only another step in the same direction toward consolidation when it assumes to exercise similar coercive authority over Governors and legislators of the States. . . . Those who regard the independence of the States in all their reserved powers—and this includes the independence of their legislative, judicial, and executive departments—as essential to the successful maintenance of our form of government, can not fail to view with the gravest apprehension for the future, the indictment in a court of the United States of a judicial officer of a State for the manner in which he has discharged his duties under her laws and of which she makes no complaint. The proceeding is a gross offense to the State; it is an attack upon her sovereignty in matters over which she has never surrendered her jurisdiction. The doctrine which sustains it, carried to its logical results, would degrade and sink her to the level of a mere local municipal corporation; for, if Congress can render the officer of a State criminally liable for the manner in which he discharges his duties under her laws, it can prescribe the nature and extent of the penalty to which he shall be subjected on conviction; it may imprison him for life, or punish him by removal from office; and, if it can make the exclusion of persons from jury service on account of race or color a criminal offense, it can make their exclusion from office on that account also criminal, and, adopting the doctrine of the district judge in this case, the failure to appoint them to office will be presumptive evidence of their exclusion on that ground. To such a result are we logically led. The legislation of Congress is founded and is sustained by this court, as it seems to me, upon a theory as to what constitutes the equal protection of the laws, which is purely speculative, not warranted by an experience of the country, and not in accordance with the understanding of the people as to the meaning of those terms since the organization of the Government." (*Ex parte Virginia*, 100 U. S. Reports, 358, 369, 370.)

In the subsequent cases of *Siebold* and *Clarke* (100 United States Reports, 371, 399) the court affirmed the doctrine that in the case of an election at which members of Congress are voted for, although State officers may also be then chosen, Congress has the constitutional power to pass an act for the punishment of a State election officer for failing to perform his duty under a State election law, or otherwise violating that law in any matter affecting the election of representatives in Congress. The question arose under section 5515 of the Revised Statutes of the United States, which was originally enacted in 1870 in the Enforcement Act, whose declared purpose was "to enforce the right of citizens of the United States to vote in the several States of this Union." It provides that "every officer of an election at which any representative or delegate in Congress is voted for, whether such officer of election be

appointed or created by or under any law or authority of the United States, or by or under any State, Territorial, district, or municipal law or authority, who neglects or refuses to perform any duty in regard to such election required of him by any law of the United States, or of any State or Territory thereof, or who violates any duty so imposed," shall be punished by fine or imprisonment, or both, as prescribed by the act of Congress. Under this law *Clarke*, a State election officer at an election held in Cincinnati, at which both members of Congress and State officers were chosen, was convicted in the United States Circuit Court for violating a law of Ohio by not conveying the ballot-box, after it had been sealed up and delivered to him for that purpose, to the county clerk, and for allowing it to be broken open. It was contended in his behalf that the act of Congress was unconstitutional for the reason that that body had no power to punish a State officer for the violation of a State law. The Supreme Court upheld the constitutionality of the legislation under that clause of the Constitution which provides that "the times, places, and manner of holding elections for senators and representatives shall be prescribed in each State by the Legislature thereof, but the Congress may, at any time, by law make or alter such regulations, except as to the place of choosing senators." The following passage from the opinion delivered by Justice Bradley shows the views of the court on this point:

It is objected that Congress has no power to enforce State laws or to punish State officers, and especially has no power to punish them for violating the laws of their own State. As a general proposition, this is undoubtedly true; but when, in the performance of their functions, State officers are called upon to fulfill duties which they owe to the United States as well as to the State, has the former no means of compelling such fulfillment? Yet such is the case here. It is the duty of the States to elect representatives to Congress. The due and fair election of these representatives is of vital importance to the United States; the Government of the United States is no less concerned in the transaction than the State government is. It certainly is not bound to stand by as a passive spectator when duties are violated and outrageous frauds are committed. It is directly interested in the faithful performance by the officers of election of their respective duties. Those duties are owed as well to the United States as to the States. This necessarily follows from the mixed character of the transaction—State and national. A violation of duty is an offense against the United States, for which the offender is justly amenable to the Government. No official position can shelter him from this responsibility. In view of the fact that Congress has plenary and paramount jurisdiction over the whole subject, it seems almost absurd to say that an officer who receives or has custody of the ballots given for a representative owes no duty to the national Government which Congress can enforce; or that an officer who stuffs the ballot-box can not be made amenable to the United States. If Congress has not, prior to the passage of the present laws, imposed any penalties to prevent and punish frauds and violations of duties committed by officers of election, it has been because the exigency has not been deemed sufficient to require it, and not because Congress had not the requisite power.

The objection that the laws and regulations, the violations of which are punishable by the acts of Congress, are State laws, and have not been adopted by

Congress, is no sufficient answer to the power of Congress to impose punishment. It is true that Congress has not deemed it necessary to interfere with the duties of the ordinary officers of election, but has been content to leave them as prescribed by State laws. It has only created additional sanctions for their performance, and provided means of supervision in order more effectually to secure such performance. The imposition of punishment implies a prohibition of the act punished. The State laws, which Congress sees no occasion to alter, but which it allows to stand, are in effect adopted by Congress. It simply demands their fulfillment. Content to leave the laws as they are, it is not content with the means provided for their enforcement. It provides additional means for that purpose; and we think it is entirely within its constitutional power to do so. It is simply the exercise of the power to make additional regulations. (*Ex parte Siebold*, 100 U. S. Reports, 387.)

From this doctrine Justices Field and Clifford dissented. Justice Hunt took no part in the case. Hence but six justices concurred in the decision of the court. In an elaborate opinion, in which Justice Clifford concurred, Judge Field maintained: first, that Congress has no power to punish a State officer for the manner in which he discharges duties imposed upon him by the laws of the State, or to subject him, in the performance of such duties, to the supervision and control of others, and punish him for resisting their interference; and, second, that it is not competent for Congress to make the exercise of its primitive power dependent upon the legislation of the States. He did not doubt that Congress might adopt the law of a State, but, in that case, the adopted law must be enforced as a law of the United States. In the case before the court there was no pretense of such adoption. The act of Congress did not say that the neglect or disregard of a duty prescribed by any *existing* law of Ohio should constitute the defense. It is the neglect or disregard of *any duty* prescribed by *any law* of the State, *present or future*. "The act of Congress," said Judge Field, "asserts a power inconsistent with, and destructive of, the independence of the States. The right to control their own officers, to prescribe the duties they shall perform, without the supervision or interference of any other authority, and the penalties to which they shall be subjected for a violation of duty, is essential to that independence. If the Federal Government can punish a violation of the laws of the State, it may punish obedience to them, and graduate the punishment according to its own judgment of their propriety and wisdom. It may thus exercise a control over the legislation of the States subversive of all their reserved rights. However large the powers conferred upon the government formed by the Constitution, and however numerous its restraints, the right to enforce their own laws by such sanctions as they may deem appropriate is left where it was originally—with the States. It is a right which has never been surrendered. Indeed, a State could not be considered as independent in any matter with respect to which its officers, in the discharge of

their duties, could be subjected to punishment by any external authority; nor in which its officers, in the execution of its laws, could be subject to the interference of others." (*Ex parte Clarke*, 100 U. S. Reports, 409.)

In *Tennessee against Davis* (100 United States Reports, 257), decided at the term beginning in October, 1879, one of the most important questions that has ever risen as to the relations between the State and the Federal Government was elaborately discussed and decided by the Supreme Court. It was whether Congress has the constitutional power to authorize the removal from a State to a Federal court of a case in which a revenue officer of the United States has been indicted by the State authorities for a crime against the State committed by the accused in the discharge of his duties as a Federal officer, and whether the Federal courts have the right to try the prisoner when Congress has neither defined the crime with which he is charged, nor prescribed punishment for it.

"A more important question," said Justice Strong, who delivered the opinion of the court, "can hardly be imagined. Upon its answer may depend the possibility of the General Government's preserving its own existence."

The question arose under the act passed by Congress in 1866, and now embodied in section 643 of the Revised Statutes of the United States. The statute provides that "when any civil suit or criminal prosecution is commenced in any court of a State against any officer appointed under, or acting by authority of, any revenue law of the United States, now or hereafter enacted, or against any person acting by or under authority of any such officer, on account of any act done under color of his office or of any such law, or on account of any right, title, or authority claimed by such officer or other person under any such law," the case may be removed from the State into the United States Circuit Court and there tried. The prisoner, Davis, had been indicted for murder in one of the courts of Tennessee. He petitioned for the removal of his case to the Federal court, alleging that he was a United States deputy collector of internal revenue; that it was his duty to seize illicit distilleries; that while so attempting to enforce the revenue laws of the United States he was assaulted and fired upon by a number of armed men, and that in self-defense he returned the fire, and committed the homicide for which he had been indicted. In behalf of the State, it was contended that murder within a State is not made a crime nor is it punishable by any act of Congress, and hence is not triable by a Federal court; that it is a crime against the peace and dignity of the State, defined and punished by the laws of the State, and a matter wholly within the jurisdiction of the courts of the State. It was further maintained that the act of Congress was intended to apply only to cases involving offenses against the revenue laws, and that if its purpose or effect was to

authorize the removal to the Federal courts of cases involving crimes against State but not Federal laws, it was in violation of the sovereignty of the State and the Constitution of the United States.

The Supreme Court, by six of its nine justices, Justices Clifford and Field dissenting, and Justice Hunt being absent, overruled these objections, and held that the removal was authorized by the act of Congress; that it was a case within the jurisdiction of the Federal courts, and that Congress had, under the Constitution, the power which it had exercised. The court further held that the act of Congress authorizes the removal of any cause when the acts of the defendant complained of were done, or claimed to have been done, in the discharge of his duty as a Federal officer. "That the act of Congress," says the opinion, "does provide for the removal of criminal prosecutions for offenses against the State laws, when there arises in them the claim of the Federal right or authority, is too plain to admit of denial. Such is its positive language, and it is not to be argued away by presenting the supposed incongruity of administering State criminal laws by other courts than those established by the State. It has been strenuously urged that murder within a State is not made a crime by any act of Congress, and that it is an offense against the peace and dignity of the State alone. Hence it is inferred that its trial and punishment can be conducted only in State tribunals, and it is argued that the act of Congress can not mean what it says, but that it must intend only such prosecutions in State courts as are for offenses against the United States—offenses against the revenue laws. But there can be no criminal prosecutions initiated in any State court for that which is merely an offense against the General Government. If, therefore, the statute is allowed to mean anything, when it speaks of criminal prosecutions in State courts, it must mean that those are instituted for alleged violations of State laws in which defenses are set up or claimed under United States laws or authority."

The authority of Congress to pass the act, the court said, was found in that provision of the Constitution which empowers Congress to provide for carrying into effect all powers granted by the Constitution. Among these powers is the Federal judicial power, which extends to "all cases in law and equity arising under the Constitution, the laws of the United States," etc. This provision, the court declared, embraces alike civil and criminal cases under the Constitution and Federal laws; and criminal as well as civil cases may be removed from a State to a Federal court whenever the Federal authority is called in question. The vast power of the General Government is set forth by Justice Strong as follows:

The United States is a government with authority extending over the whole territory of the Union, acting upon the States and upon the people of the States.

While it is limited in the number of its powers, so far as its sovereignty extends, it is supreme. No State government can exclude it from the exercise of any authority conferred upon it by the Constitution, obstruct its authorized officers against its will, or withhold from it for a moment the cognizance of any subject which that instrument has committed to it. . . . The founders of the Constitution could never have intended to leave to the possibly varying decisions of the State courts what the laws of the government it established are, what rights they confer, and what protection shall be extended to those who execute them. If they said, Where is the supremacy over those questions vested in the Government by the Constitution?—if, whenever and wherever a case arises under the Constitution and laws or treaties of the United States, the national Government can not take control of it, whether it be civil or criminal, in any stage of its progress—its judicial power is, at least, temporarily silenced instead of being at all times supreme. In criminal as well as in civil proceedings in State courts, cases under the Constitution and laws of the United States might have been expected to arise, as, in fact, they do. Indeed, the powers of the General Government, and the lawfulness of authority exercised or claimed under it, are quite as frequently in question in criminal cases in State courts as they are in civil cases, in proportion to their number.

From the decision of the majority Justices Clifford and Field dissented, the former writing an elaborate opinion, in which the latter concurred. Justice Clifford maintained that the act of Congress in question did not authorize the removal of a State indictment for an offense against the laws of the State from the State to the Federal courts for trial, and that, if it did, it was unconstitutional and void. He held that the Federal courts have no jurisdiction of a criminal act which Congress has not made a crime. "Decided cases everywhere hold," he said, "that, unless Congress first defines the offense, affixes the punishment, and declares, in some way, the court that shall have jurisdiction of the accusation, the Circuit Court can neither try the accused nor sentence him to punishment. Even the power of Congress to define offenses and provide for the punishment of offenders is limited to such subjects and circumstances as relate and are peculiar to the Federal Government." He admitted that Congress might declare the killing of a revenue officer, while in the discharge of his official duties, even when done within a State, to be murder, and might prescribe punishment for the crime. In that case the Federal courts would have jurisdiction of it. "But the principal question in this case," he said, "is of a very different character, as the indictment is against the officer of the revenue for murdering a citizen of the State, having in no way any official connection with the collection of the public revenue. Neither the Constitution nor the acts of Congress give a revenue officer, or any other officer of the United States, an immunity to commit murder in a State, or prohibit the State from executing its laws for the punishment of the offender. . . . Nobody before ever pretended that such an offense ever was or could be defined by an act of Congress as an offense against the Federal authority, or

that the Circuit Court, or any other Federal court, has or ever had any jurisdiction of such a case to try or sentence such offender for such an offense. . . . Legislative power is undoubtedly vested in Congress to pass laws to define and punish offenses against the authority of the United States; but it does not follow by any means that a prisoner, charged with murder committed in violation of the laws of a State, may claim to be tried in a Federal Circuit Court, or that a State indictment for such an offense constitutes a case arising under the Constitution or the laws of the United States, or that it can in any way become cognizable in such a tribunal, certainly not unless it can be removed there in pursuance of some act of Congress defining the offense and providing for the trial and punishment of the offender. Persons charged with offenses against the authority of the States find ample guarantees of a fair trial in the laws of the States and the usages of the State courts, and, if the Federal officers need more, it belongs to Congress to provide the remedy in some mode authorized by the Constitution. . . . Large concessions were made by the States to the United States, but they never ceded to the national Government their police powers, or the power to define and punish offenses against their authority, as admitted by all courts and all commentators upon the Constitution."

The same view was also maintained by Justice Field, with whom Justice Clifford concurred, in the dissenting opinion in the case of *Virginia against Rives* (100 U. S. Reports, 336). He claimed that murder committed within a State, in violation of its laws, is an offense against the authority of the State, and that the State alone has the right to try and punish the offender. "Murder," he said, "is not an offense against the United States, except when committed on an American vessel on the high seas, or in some port or haven without the jurisdiction of the State, or in the District of Columbia, or in the Territories, or at places where the national Government has exclusive jurisdiction. The offense within the limits of a State, except where jurisdiction has been ceded to the United States, is as much beyond the jurisdiction of these courts as though it had been committed on another continent. The prosecution of the offense in such a case does not, therefore, arise under the Constitution and laws of the United States; and the act of Congress which attempts to give the Federal courts jurisdiction of it is, to my mind, a clear infraction of the Constitution. . . . I do not think I am going too far in asserting that, had it been supposed a power so dangerous to the independence of the States, and so calculated to humiliate and degrade them, lurked in any of the provisions of the Constitution, that instrument would never have been adopted."

By the acts of Congress passed during and since the war, for the removal of causes, the

jurisdiction of the Federal courts has been immensely enlarged, and that of the State courts correspondingly diminished. "From various causes which we need not now stop to trace," says Judge Dillon, in his work on "Removal of Causes," "the small tide of litigation that formerly flowed into Federal channels has swollen into a mighty stream. Certain it is that of late years the importance of the Federal courts has rapidly increased, and that much, perhaps most, of the great litigations of the country are now conducted in them." Among the special statutes that have been passed on this subject may be mentioned those providing for the removal from State to Federal courts in civil and criminal cases against persons denied civil rights; in civil and criminal cases against revenue officers of the United States; in civil and criminal cases arising under the Federal election laws; in suits by aliens against officers of the United States, under specified circumstances; and in actions against Federal corporations. Besides these, several very important acts of more general operation have been passed. At the close of the war, the right of removal on the ground of citizenship was limited to cases in which the plaintiff, or all of the plaintiffs, if more than one, were citizens of the State in which the suit was brought, and the defendant, or all of the defendants, were citizens of another State or States. The right was further restricted to civil cases, and could be exercised only by the defendant, or, if more than one, all had to join in the application.

By the act of July 27, 1866, the right of removal was extended, under certain circumstances, to any one of the non-resident defendants so far as the action affected him. By the "prejudice or local influence" act of 1867 the right was given to both a non-resident plaintiff and a non-resident defendant, if either makes "an affidavit that he has reason to believe, and does believe, that from prejudice or local influence he will not be able to obtain justice in such State court." That is, on the conditions specified, if a suit is brought in a State court by a citizen of that State, against the citizen of another State, the latter may have the case removed to a Federal court; or when a person has brought an action in the courts of his own State against the citizen of another State, the plaintiff may remove it into the Federal court. "This act," says Dillon, "undoubtedly grew out of the condition of affairs in the Southern States after the war of the rebellion, and was intended to afford to plaintiffs who had resorted to the State court the right to transfer their suits to the Federal courts. This is the first act that, in any event, extended the right to a *plaintiff* to leave the forum he had voluntarily chosen, and in this respect was an entire departure from all the previous legislation. It is not so difficult to justify the act in this respect, even if it was intended to be permanent, as it is to sustain

the provision that this removal may be had, on filing the general affidavit of prejudice or local influence, 'at any time before trial or final hearing of the suit.'"

The act of March 3, 1875, made another very material enlargement of Federal at the expense of State jurisdiction. By all previous legislation, the right of removal was limited to cases in which either the plaintiff or the defendant was a citizen of the State in which the suit was originally brought. The act of 1875 abolishes this limitation and authorizes the removal of cases in which neither party is a citizen of the State in which the action was begun. It is enough if they are citizens of different States. They need not be citizens of that in which the suit is brought, and the right of removal is given to either plaintiff or defendant. Besides thus increasing the class of cases that may be removed into the Federal courts on the ground of citizenship, the act also materially widens the circle of those that may be removed on the ground of subject-matter independently of citizenship.

The constitutional validity of all these acts has been affirmed or recognized by the Supreme Court, and on controverted points, as to the meaning and effect of the acts, the decisions of the court, which have not always been unanimous, have tended greatly to extend the jurisdiction of the Federal judiciary, and hence to limit that of the State courts. Thus, in construing the act of 1867, the majority of the court held that a suit to annul a will as a muniment of title, and to restrain the enforcement of a decree admitting it to probate, was a suit in equity which might be removed to the Federal court when the parties were citizens of different States. Three of the judges dissented from this conclusion, and maintained that the question involved was simply one relating to the probate of a will, and that, under the act of Congress, the Federal tribunals had no jurisdiction of such a case. (Gaines against Fuentes, 92 United States Reports, 10.) And so, in the case of a Railroad Company against Mississippi, decided in 1880, and reported in 102 United States Reports, Justice Miller maintained, in a dissenting opinion, that the act of 1875 did not authorize a removal of a suit which was not founded on a Federal law, but in which a Federal law was incidentally involved in the defense merely. While Congress "intended to allow the removal of a suit where the very foundation and support thereof was a law of the United States, it did not intend to authorize a removal where the cause of action depended solely on the law of the State, and when the act of Congress only came in question incidentally as part (it might be a very small part) of the defendants' plea in avoidance." The majority of the court, however, consisting in this case of six justices, held that "it is not sufficient to exclude the judicial power of the United States from a particular case, that it

involves questions that do not at all depend on the Constitution or laws of the United States; but when a question to which the judicial power of the Union is extended by the Constitution forms an ingredient of the original cause, it is within the power of Congress to give the Circuit Courts jurisdiction of that cause, although other questions of fact or of law may be involved in it." The court has also held (*Insurance Company against Morse*, 20 Wallace, 445) that the right to remove cases into the Federal court pursuant to the acts of Congress can not be defeated by State legislation. In accordance with this view it declared that a State statute allowing a foreign corporation to do business in the State only on condition that it would agree not to remove suits against it to the Federal courts, was unconstitutional, and the agreement void.

A striking development of Federal power may also be traced in the decisions of the Supreme Court interpreting that clause of the Constitution which vests in Congress power to regulate commerce among the States and with foreign nations. For more than a third of a century after the adoption of the Constitution it was a much-debated question what were the respective rights of the national and the State governments under this clause. In 1824 the Supreme Court declared, in the case of *Gibbons against Ogden*, that the power to regulate foreign and interstate commerce was exclusive in Congress. This, however, left many important questions unsettled. For a quarter of a century after its announcement it was maintained, not only by leading public men and constitutional lawyers, but also by several of the Supreme Court justices, that in the absence of congressional legislation a State had the power to legislate on the subject, and two decisions of the Supreme Court during that period are in harmony with this doctrine, if they do not directly support it. In 1851, however, the court denied to the States most of the power that had been claimed for them, and conceded it to the Federal Government. It held that in all matters of national character and concern the power was exclusive in Congress, whether exercised or not, and hence that even in the absence of congressional action no State had authority to pass laws in matters of that kind. It conceded, however, that in the absence of Federal legislation a State might deal with certain strictly local matters pertaining to foreign and interstate commerce, but held that even in such case State legislation must give way to or at least harmonize with any acts that Congress might choose to pass on the subject.

The theory that in purely internal commercial affairs the authority of the State is supreme has never been denied. But even here the Federal power has been steadily carried by the logic of events and judicial decisions into the domain of every State, and corresponding inroads have been made upon State sovereignty.

Commerce has become nationalized, and now partakes of an interstate character to an extent that was perhaps not dreamed of by the framers of the Constitution. In 1870 the Supreme Court, holding that a steamer whose trips were made wholly within one State, was subject to the laws of Congress, because transporting things brought from or destined to another State, declared that all local agencies or instruments, though operating wholly within the State, fall under the jurisdiction of the General Government when employed in interstate commerce. "It is said," remarked the court, "that if the position here asserted be sustained, there is no such thing as the domestic trade of a State; that Congress may take the entire control of the commerce of the country, and extend its regulations to the railroads within a State on which grain or fruit is transported to a distant market. We answer that the present case relates to transportation on the navigable waters of the United States, and we are not called upon to express an opinion upon the power of Congress over interstate commerce when carried on by land transportation. And we further answer that we are unable to draw any clear and distinct line between the authority of Congress to regulate an agency employed in commerce between the States, when that agency extends through two or more States, and when it is confined in its action entirely within the limits of a single State. If its authority does not extend to an agency in such commerce, when that agency is confined within the limits of a State, its entire authority over interstate commerce may be defeated." (The Daniel Ball, 10 Wallace, 566.)

In the case of *Lord against Steamship Company*, decided during the session of 1880-'81, and reported in 102 United States Reports, the lines of Federal supremacy were carried by the court to a frontier in State domain before unknown. It held that a vessel plying exclusively between the ports of one State, and engaged in traffic purely and wholly internal, is employed in commerce over which Congress has exclusive control, provided that in making its trips it goes out of the jurisdictional waters of the State upon the high seas for any distance, however short. As vessels employed in domestic trade do generally go upon the high seas, the effect of this decision is to transfer from a claimed State to Federal control the bulk of the coasting-trade of the country, although carried on entirely within the limits of the States.

This general outline of the decisions by the Supreme Court shows a remarkable development of central power on the most important points affecting the relations between the States and the General Government.

LAWRENCE, WILLIAM BEACH, LL. D., an American jurist and eminent writer on international law, was born in the city of New York, October 23, 1800; died there, March 26, 1881.

He was the only son of Isaac Lawrence and his wife Cornelia, daughter of Dr. Abraham Beach, for many years one of the ministers of Trinity Church, New York, and a descendant of the first white child born in the colony of Connecticut. Isaac Lawrence was an opulent merchant, and for many years was President of the New York branch of the United States Bank, and one of the presidential electors of James Monroe. Lawrence's ancestors came from England about the middle of the seventeenth century, and received a patent for a portion of Long Island, now constituting the towns of Flushing, Hempstead, and Newtown. He was sent to Dr. Barry's school in Rector Street, and at the age of twelve, being too young to gain admission in Columbia College, he entered Rutgers in New Jersey, spending two years there, when he joined the former institution, graduating with high honors in the class of 1818. Henry J. Anderson was the only one above him, while James Lenox stood number nine in the same class. After a tour to the West as far as the Mississippi, Lawrence entered the office of William Slosson, an eminent New York lawyer. He also spent a year under the instruction of Judges Gould and Reeves, in whose law-school, at Litchfield, Connecticut, John C. Calhoun was then a student. During the winter of 1820-'21 Mr. Lawrence visited some of the leading families of South Carolina, and spent several days with Jefferson at Monticello, and with Madison at Montpelier. Soon after his return to New York he married Esther, daughter of Archibald Gracie, a wealthy merchant, and sailed for Europe in one of Mr. Gracie's ships, carrying letters of introduction from President Monroe, Secretary of State J. Q. Adams, the French minister, Joseph Bonaparte, his father-in-law's intimate friend and frequent guest, Madison, and Jefferson, by whom he was introduced to Lafayette, who entertained him and his young wife for a fortnight at La Grange. They were guests of Lord Holland at Holland House, and of the Bonapartes at Rome, then a center of elegant European society.

In 1823, Mr. Lawrence returned to the United States, and was there admitted as counselor to the Supreme Court of New York. His special attention was given there, as previously, to political economy and international law, but not to the exclusion of his taste for the beautiful, as seen in his address in 1825 before the New York Academy of Fine Arts. In 1826, at the request of Albert Gallatin, he was appointed secretary of legation to Great Britain, Gallatin being our ambassador, and his part in the negotiations may be inferred from Mr. Gallatin's report to the State Department, that Mr. Lawrence was competent alone to conduct the mission. In 1827 President Adams appointed him *chargé d'affaires*, and his correspondence with Lords Dudley and Aberdeen concerning the settlement of the boundary of our northern and northeastern frontier evinced his diplo-

matic ability and established his reputation as an expounder of international law. While in London he was intimate with members of the Political Economy Club, including McCulloch, Grote the historian, Jeremy Bentham, and Sir John Bowring, who became both his friend and physician, and he was a frequent contributor to the "Westminster Review." From England he went to Paris, and while pursuing his favorite studies, translated into English the "History of Louisiana," by Marbois (which was published in 1830), and made the acquaintance of Cousin, Guizot, Villemain, and many other men of eminence. On his return to New York after an absence of four years, he formed a law partnership with Hamilton Fish, and displayed great powers in prosecuting claims for indemnity under the treaty of 1831, called the Rives Treaty, in which the Lawrence family were largely interested, the claims being for spoliation under the decrees of Napoleon in violation of the law of nations. His arguments were commended by Webster, with whom he was associated in some of the most important cases.

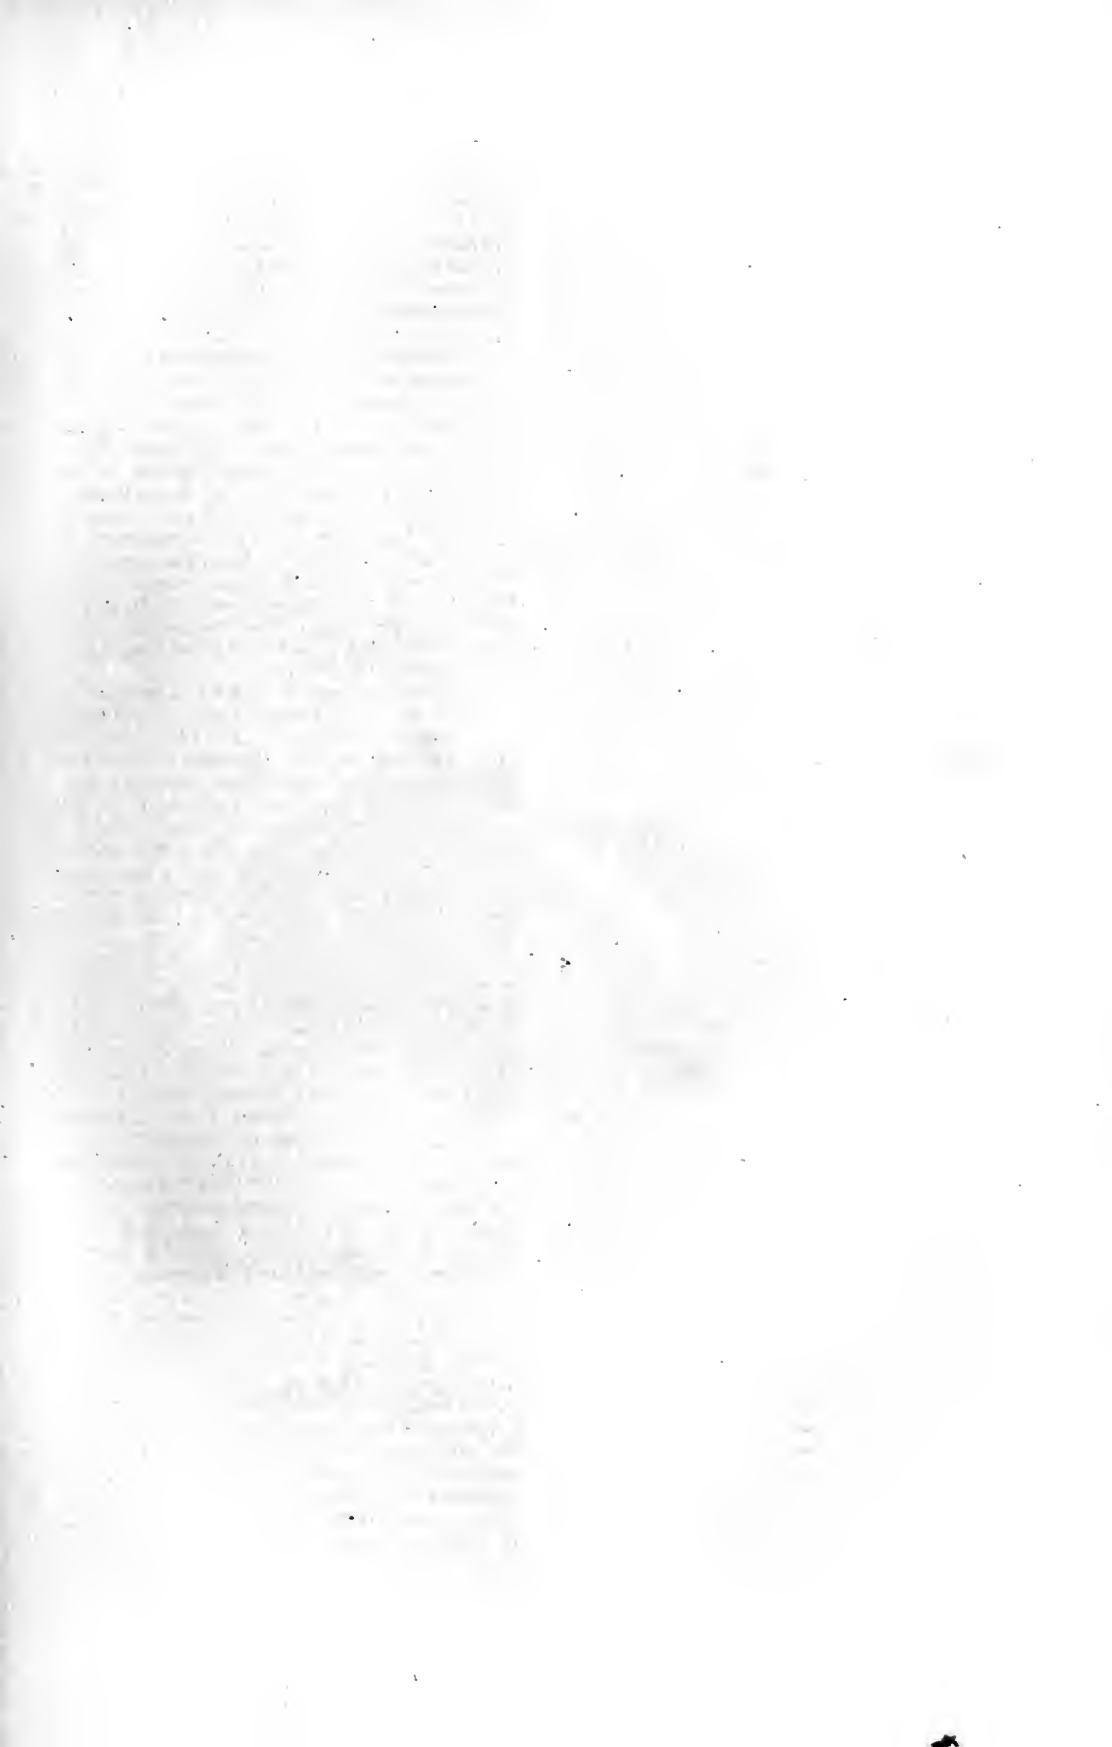

The lectures on political economy before the senior class of Columbia College were repeated by Mr. Lawrence before the Mercantile Library Association, and were afterward published. These able lectures were in defense of free trade, of which he was always a warm advocate. He was an active member of the New York Historical Society, and from 1836 to 1845 vice-president of the society, Gallatin being president. In the latter year, Mr. Lawrence, by his able argument before the Court of Errors, obtained a reversal of the Chancellor's decision (*Miller vs. Gable*, 4 Denio, 570). At this period he purchased a large estate known as Ochre Point, at Newport, Rhode Island, where he erected a commodious summer residence, and in 1850 he removed his permanent home to that place, where he continued to reside until his death, with the exception of an occasional visit to Europe, or a winter spent in Washington. Soon after his settlement in Newport he was elected Lieutenant-Governor, and in a short time, by a provision of the State Constitution, he became Governor of Rhode Island. While acting as such, he was instrumental in abolishing the law for imprisonment for debt, in procuring a reform in the management of the jails, and in advancing various other reforms.

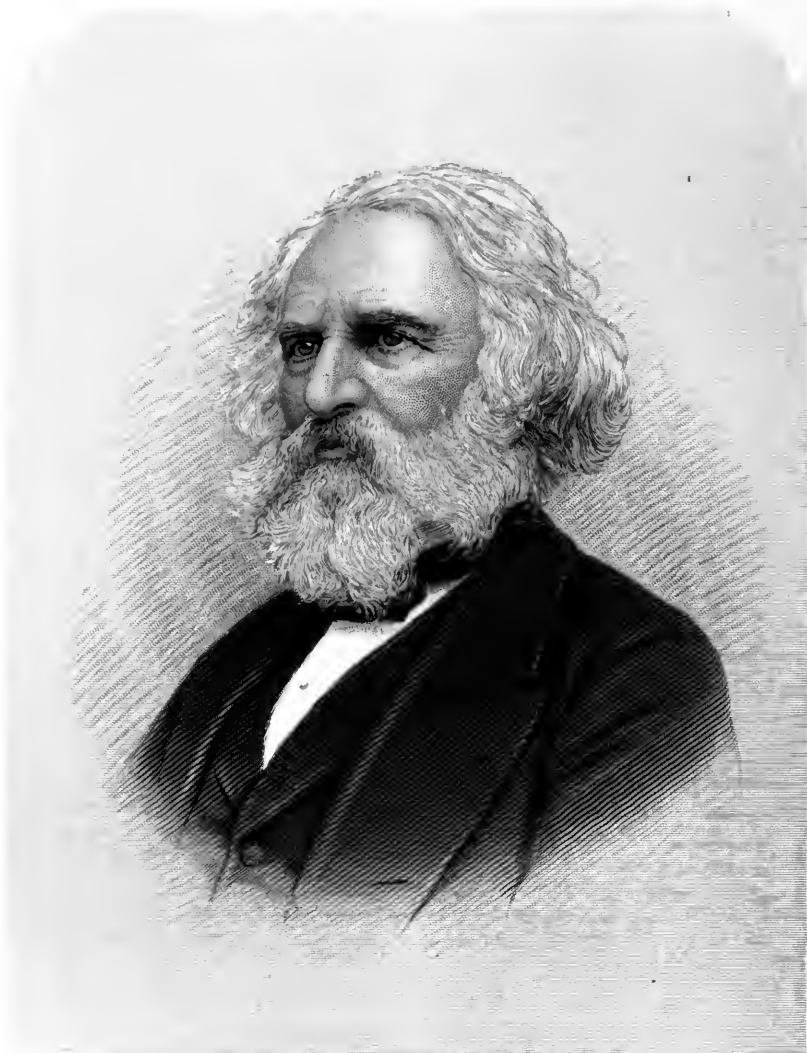

After the death of his friend Henry Wheaton, Mr. Lawrence prepared an edition of his "Elements of International Law," which was published in 1855, for the benefit of Mr. Wheaton's destitute family. This work, which was more than doubled in size by the addition of Lawrence's original matter, made the name of Wheaton well known throughout the United States and Europe. It immediately met with almost universal adoption in courts and consular offices, and in colleges and universities, at home and abroad. A second edition, bringing the text down to date, was issued by Governor

Lawrence in 1863. Lawrence's Wheaton has ever since been the accepted text-book among diplomatists, and as such is always referred to in the United States Senate, to which body, in connection with the President, the whole treaty-making power is confided. It is the standard work in the English language upon the subject of international law, and it has appeared in many of the European tongues. It has even been translated into the languages of China and Japan, and was the first English work that appeared in Japanese. A rival edition by Richard Henry Dana, purporting to be original, and covering exactly the same ground as Lawrence's Wheaton, led to long litigation in the United States Circuit Court for Massachusetts. Judge Clifford fully confirmed the claims of Governor Lawrence, declaring Dana's work to be an infringement of the American copyright law, and said, "Such a comprehensive collection of authorities, explanations, and well-considered suggestions, is nowhere, in the judgment of the court, to be found in our language," as in Lawrence's Wheaton.

In 1868 there was published at Leipsic the first volume of Lawrence's great original work on "International Law." The fifth volume of this important treatise appeared in 1880, and the sixth and concluding volume, now in manuscript and almost complete, will soon be finished by another hand, and published by Brockhaus. This *magnum opus*, which was written and published in French, occupied a large portion of the author's time during the last twelve years of his long and busy life. Among his many other publications may be mentioned, "The History of the Negotiations in Reference to the Eastern and Northeastern Boundaries of the United States" (New York, 1841); "The Treaty of Washington" (Providence, 1871); "Disabilities of American Women Abroad" (New York, 1871); and "Administration of Equity Jurisprudence" (Boston, 1874).

While in Europe, Brown University conferred upon him the degree of Doctor of Laws, and he was distinguished as the first recipient of the title of Doctor of Civil Law granted in the United States, by a degree conferred by the Regents of the University of the State of New York. As an international counselor he was unsurpassed perhaps either in Europe or America. He achieved great professional distinction in appearing before the British and American International Tribunal at Washington, in 1873, in the case of the Circassian, involving more than half a million dollars. He won the suit, obtaining for his clients the reversal of a decision of the United States Supreme Court, the only instance of that character which has occurred in the country's history. Lawrence's argument in the case, on which the decision was rendered, is now regarded, both here and in Europe, as an authoritative exposition of several most important points of international law. He was one of the original members of the "Institute of the Law of Nations," com-

Henry W. Longfellow.

posed of the most eminent publicists, and belonged to many literary and scientific societies. In politics he was ever true to those principles which in youth he personally learned from Jefferson and Madison. His several residences in Europe, associating there with the leading scholars, statesmen, and diplomatists, and for more than sixty years enjoying the same privilege in his native land, gave to Governor Lawrence a courtly and classic dignity of manner not often met with among our public men. For thirty years, Governor Lawrence was noted for the generous hospitality dispensed at Ochre Point. Few persons of distinction, in any walk of life, visited Newport without being entertained by him at his beautiful mansion by the sea. Here he had collected probably the most valuable private library of its character in the land, numbering more than ten thousand volumes, and including everything of value relating to international law and political economy to be found in the English, French, Spanish, and Italian languages. Governor Lawrence left three sons and two daughters, Mrs. Lawrence having died in 1858, a short time previous to his third visit to Europe. The closing item of his will contains a valuable warning to testators: "Aware of the ruinous consequences of litigation to all concerned in the case of wills, I do hereby declare it to be my will that in case any child or descendant of a child, who may claim any share in my estate, shall oppose the probate of this, my last will and testament, or take any legal proceedings to impeach the validity of any of its provisions, the said child or other descendant shall be debarred from all participation in my property, real or personal, and the share of such child or descendant shall descend to and be possessed by the person or persons who would have been entitled thereto, had said child or descendant of child died in my life-time." At the annual meeting of the New York Historical Society, held January 3, 1882, General James Grant Wilson delivered an address on Governor Lawrence, and at the same time presented to the society a fine marble bust by Dunbar, the gift of his eldest son, Isaac Lawrence; and also presented, in behalf of his executors, an unfinished paper on "The Life, Character, and Public Services of Albert Gallatin," which had been prepared for the society, but was not quite completed at the time of his death. This very valuable paper, the last literary work of his long and laborious career, was read to the society by Edward F. De Lancey, February 8, 1882, and has since been published; while General Wilson's address, with a portrait of Lawrence, appeared in the April number of the "Genealogical and Biographical Record."

LETELLIER DE SAINT-JUST, LUC, a Canadian statesman and ex-Lieutenant-Governor of Quebec, died February 1st, at the age of sixty-two. He was born at the seignory of River Ouelle, which he always considered his home, and where he died of a lingering lung-disease.

He was by profession a notary public, but his active bent led him into political life. He was elected to represent Kamouraska in the Canadian Parliament, at the age of thirty-one, and in several subsequent elections was defeated in the same district. In 1860 he was chosen one of the Legislative Council as representative from Grenville Division. After the Confederation he was made a Senator of the Dominion. Although deprived by the circumstances of his career from taking the prominent part as a political leader which he might have done as a member of the popular Assembly, he was still an active and decided politician of the liberal persuasion. In the popular Assembly he held the position of Minister of Agriculture for a few months in the Macdonald-Dorion Government, and when Mr. Mackenzie was called upon to form an administration in 1875 he accepted the same portfolio, with the position of leader of the French Liberal contingent in the Senate. In 1876 he resigned both senatorship and portfolio on his appointment to the lieutenant-governorship of Quebec. During his tenure of this office occurred the famous conflict which resulted in his defeat and retirement to private life, while the political world of Canada was shaken to the foundations by the constitutional crisis which he precipitated. He came into collision with his advisers, the members of the De Boucherville Government; and the quarrel between him and them ended in their dismissal, the formation of the Joly Government, and an appeal to the people, which resulted in a majority of one for the new administration. Letellier was accused by his political opponents of a blind and reckless partisanship which led him to overstep the principles of the Constitution, while his fellow-Liberals, though piqued at the electoral defeat which his course entailed, and disposed to condemn that course as a mistake in policy, applauded the courage with which he asserted the authority of the Executive, and approved his position at the time as just and patriotic.

LITERATURE, AMERICAN, IN 1881. There has been much more than the usual activity in American literature during the year. All departments of knowledge have received more or less attention, and the production of sound, healthful works has kept fair pace with the increasing mass of imaginative and fantastic publications in prose and verse. A considerable portion of American literary effort has been devoted to the translation of foreign books, the preparation and issue of new editions of all kinds of works that have met with favor, and the editing and making additions to English publications for the American market. A large amount of activity also, in American as in English literature, has found its outlet in reviews, magazines, journals, etc.

"The Publishers' Weekly," the organ of the American book-trade, gives as heretofore the lists of publications of the chief American houses, with a classified monthly synopsis of

the more prominent books. The result furnishes the following approximate numbers of books of various classes issued in 1881 (being nearly 1,000 more than were published during the preceding year):

CLASS.	No. of works.
Fiction.....	587
Juveniles.....	384
Theology and Religion.....	344
Biography Memoirs, Correspondence, etc.....	212
Education, Language.....	157
Description, Travel, etc.....	164
Medical Science, Hygiene, etc.....	190
Poetry and the Drama.....	169
Literary History and Miscellany.....	128
Political and Social Science.....	86
History.....	108
Useful Arts, Commerce.....	78
Law and Government.....	76
Physical Science, Mathematics, etc.....	89
Fine Arts, Illustrated Works.....	57
Domestic and Rural.....	88
Amusements, Sports, etc.....	21
Humor and Satire.....	85
Music (Church and School).....	23
Mental and Moral Philosophy.....	27
Books of Reference.....	71
Total.....	2,991

In *Theology and Religion* there are few, if any, really great works which have appeared during the year; yet the contributions to this department are numerous and not unworthy of record. American divines have published largely in the way of sermons and lectures. The Rev. Dr. L. Bevan's "Sermons to Students and Thoughtful Persons" (New York, Scribner's Sons) are excellent in tone and teaching. Dr. H. C. Potter's "Sermons of the City" (New York, E. P. Dutton & Co.), addressed to a large and wealthy congregation, are equally appropriate and effective. Rev. E. E. Hale issues two volumes (Boston, Roberts), "The Kingdom of God" and "The Life in Common, and other Sermons," which are marked by the author's usual style and mode of dealing with his subject. Dr. E. H. Chapin's "Church of the Living God" and "God's Requirements, and other Sermons" (New York, James Miller), have been published since his death, and will serve to perpetuate his memory. Bishop A. N. Littlejohn's "Individualism: its Growth and Tendencies, with some Suggestions as to the Remedy for its Evils" (New York, T. Whittaker), contains the admirable discourses preached by him before the University of Cambridge, England. It is one of the most valuable and thoughtful volumes of the year. "Christ and Modern Thought" (Boston, Roberts) are the Boston Monday Lectures for 1880-'81, delivered by eminent American clergymen (Dr. J. C. Smith, Dr. Howard Crosby, Dr. McCosh, Bishop Clark, etc.), in the absence of Mr. Joseph Cook. It deals with topics no less interesting than important. Dr. M. Dix's "Lectures on the First Prayer-Book of King Edward VI" (New York, E. & J. B. Young & Co.) have excited much attention in the Episcopal Church, because of their severe treatment of the English Reformers, and the author's disposition to throw off, as much as possible, the *Protestant* character of the English Reforma-

tion. Rev. J. W. Chadwick's "The Man Jesus" (Boston, Roberts); Rev. Phillips Brooks's "The Candle of the Lord, and other Sermons" (New York, E. P. Dutton & Co.); Dean Howson's "Evidential Value of the Acts of the Apostles" (same publishers), are among the noteworthy books of this class. The tenth and last volume of "McClintock and Strong's Cyclopædia" (New York, Harper & Brothers) renders complete this valuable work; a supplementary volume is promised. In the way of republication the sermons of F. W. Robertson, of Stopford A. Brooke, of Dr. Vaughan, the Scotch Sermons, Hatch's Bampton Lectures on the organization of the early Church, and W. Robertson Smith's Old Testament in the Jewish Church (twelve lectures on Biblical Criticism), deserve brief mention here, as indicating the drift of theological opinion and speculation on the important topics of inspiration, right interpretation of Holy Scripture, the eternal world, etc. Dr. Geikie's "Hours with the Bible" (3 volumes, New York, James Pott) is well-timed, and presents in a popular style the results of biblical study and research in connection with Old Testament history and exegesis. Punchard's "History of Congregationalism, from about A. D. 250 to the Present Time" (Boston, Congregational Publishing Society) gives "Congregationalism in America" in the fourth volume; it is regarded as the standard history of that denomination. Merle D'Aubigné's "History of the Reformation in the Sixteenth Century" has been brought out, five volumes in one, by Carters, New York. Its merits and defects, as some esteem them, are too well known to need special mention here. In Exegesis, Dr. H. Cowles has added two volumes ("St. Matthew and St. Mark" and "St. Luke and the Acts of the Apostles") to his other valuable contributions, making in all nine volumes on the Old Testament and seven upon the New (New York, D. Appleton & Co.). A "Commentary on the Gospel of St. Luke," from the French, by Rev. F. Godet, edited by Dr. John Hall (New York, I. K. Funk & Co.), and Dr. W. H. Van Doren's "Suggestive Commentary" on the same Gospel (same publishers), deserve mention in this connection. So also does Dr. Young's "Analytical Concordance to the Bible" (republished by Funk & Co., New York), as being the most learned and complete work of the kind in the English language. Apologetical works are quite numerous. Professor J. L. Diman's "The Theistic Argument as affected by Recent Theories," such as development, evolution, natural selection (Boston, Houghton, Mifflin & Co.); Dr. B. Franklin's "The Creed and Modern Thought" (E. & J. B. Young & Co, New York); and Godet's "Lectures in Defense of the Christian Faith" (New York, A. D. F. Randolph & Co.), are each in its way able, effective, and well-timed, in view of the wide range which has been given to the discussion of the evidences of Christianity.—The most noteworthy event, however, in the

religious and theological record of the year is the publication of the Revised Version of the New Testament. This had been long and anxiously waited for, and, when it did appear, the excitement was intense. The printing-press could hardly furnish copies fast enough to supply the demand; edition after edition was called for; the New Testament became for the time the best-read book in the language; and the amount of examination which the New Version roused into activity was indeed marvelous. From every quarter, too, criticism has been freely bestowed, and the result, in few words, is that the New Version (for it is really *new*, though professedly only "revised") takes its place as a work of substantial merit and value. It may not—it probably will not—be adopted, *in toto*, by any large portion of the English-speaking Christian world; but it will be acknowledged by all as a monument of the painstaking care and faithful diligence of the large body of scholars and divines, American as well as English, who prosecuted it to its final completion. The year 1881 is also notable, in this department, as having witnessed the publication of Drs. Westcott and Hort's "New Testament in the Original Greek," a work of the highest value to theology. The American edition is edited by Dr. Schaff, with an Introduction (New York, Harper & Brothers).

Philosophy, both mental and moral, presents almost a blank in 1881. Dr. Mark Hopkins's work, "The Law of Love, and Love as a Law, or Christian Ethics," has been issued in a new and revised edition (New York, Scribner's Sons); in it the theory of morals is restated for use, and there is given also "The Outline Study of Man." Dr. L. P. Hickok's "Empirical Psychology" (Boston, Ginn, Heath & Co.) appears in a new and revised edition, with the co-operation of President Seelye, of Amherst. Mr. W. W. Kingsley's "Views on Vexed Questions" (Philadelphia, Lippincott & Co.) are well worth looking into, though not very profound; and Miss Frances Power Cobbe discusses "The Duties of Women" (Boston, G. H. Ellis) with her usual pith and point. Among reprints is A. C. Fraser's "Berkeley" (Philadelphia, Lippincott), and of more than ordinary merit; also, Mr. J. Sully's "Illusions: a Psychological Study" (International Scientific Series, D. Appleton & Co.); F. A. Lange's "History of Materialism and History of its Present Importance," authorized edition, in three volumes (English and Foreign Philosophical Library, Boston, Houghton, Mifflin & Co.); the translation of G. A. Jacob's "Manual of Hindu Pantheism, the Vedantasara" (the same library and publishers); and J. Legge's "The Chinese Classics, Part I, Confucius, Part II, Mencius" (new edition, Boston, Houghton, Mifflin & Co.).

In *Physical and Natural Science* there is a goodly number of publications, though not many by native authors. Professor C. A. Young's "The Sun" (International Scientific Series, D.

Appleton & Co.) is an able and exhaustive treatise. In the same series Professor J. Le Conte gives a lucid exposition of the principles of monocular and binocular vision, in his volume on "Sight." Dr. B. Peirce discusses very ably, "Ideality in the Physical Sciences" (Boston, Little, Brown & Co.). James Orton, in a new and augmented edition, treats of "Underground Treasures" (Philadelphia, H. C. Baird & Co.), tells how and where to find them, giving thus a key for the ready determination of all the useful minerals within the United States. S. H. Scudder's "Butterflies" (New York, Holt) is a very attractive volume on this subject; it describes the structure of butterflies, their changes and life histories, with special reference to American forms. As of similar character and value are "The Honey-Ants of the Garden of the Gods, and the Occident Ants of the American Plains," by H. C. McCook (Philadelphia, J. B. Lippincott & Co.). J. P. Lesley, in a new and enlarged edition, presents very forcibly "Man's Origin and Destiny, sketched from the Platform of the Physical Sciences" (Boston, G. H. Ellis). In this department American literature owes very much to the works of English and Continental writers republished in the United States. Miss A. B. Buckley's "Life and her Children, Glimpses of Animal Life" (New York, D. Appleton & Co.), is an admirable popular manual; as is also "A World of Wonders" (same publishers), a book for young readers, profusely illustrated. Professor R. A. Proctor's "Poetry of Astronomy" (Philadelphia, Lippincott & Co.) is curiously interesting and suggestive; and A. R. Wallace's "Island Life, or the Phenomena and Causes of Insular Faunas and Floras" (New York, Harper & Brothers), is certainly not less so. In the International Scientific Series there may be noted, as more than ordinarily valuable, Professor H. Morselli's "Suicide, an Essay in Comparative Moral Statistics"; A. Wurtz's "The Atomic Theory" (from the French); and Professor J. W. Judd's "Volcanoes, what they are and what they teach." Charles Darwin makes another valuable contribution to science in his "Formation of Vegetable Mould through the Action of Worms, with Observations on their Habits" (New York, D. Appleton & Co.). Professor James Geikie, in his "Prehistoric Europe" (Philadelphia, Lippincott & Co.), gives a profoundly interesting sketch of the geological condition of Europe in early days; and St. George Mivart presents an elaborate and careful study of back-boned animals, especially mammals, in his volume on "The Cat" (New York, Scribner's Sons). E. B. Tylor's "Anthropology" is one of the best books of the year, and is an admirable introduction to the study of man and civilization (New York, D. Appleton & Co.).

Among works in the *Useful Arts, Technical* works, etc., a few only of the most valuable of the year are here named: Thomas Tredgold's "Elementary Principles of Carpentry" (New York, Spon); W. H. Uhland's "Corliss En-

gines and Applied Steam Motors" (Spon); L. R. Hamersly's "Naval Encyclopedia," and T. Wilhelm's "Military Dictionary and Gazetteer" (Philadelphia, L. R. Hamersly & Co.); E. S. Philbrick's "American Sanitary Engineering" (New York, Sanitary Engineer Office); R. S. Christiani's "Technical Treatise on Soap and Candles" (Philadelphia, H. C. Baird & Co.); J. B. Denton's "Sewage Disposal" (New York, Spon); J. Parry's "Water, its Composition, Collection, and Distribution" (New York, Scribner & Welford); J. Cundall's "Bookbindings—Ancient, Mediæval, and Modern," with plates (Scribner & Welford); G. P. Brown's "Sewer Gas and its Dangers" (Chicago, Jansen, McClurg & Co.); A. Spitzli's "Enlarged Manual for Managers, Designers, and Weavers" (Troy, New York, W. H. Young); T. P. Teale's "Dangers to Health," a pictorial guide to domestic sanitary defects (Philadelphia, Blakiston); and A. J. Downing's pleasant and profitable "Rural Essays" (New York, Worthington).

In *Medical Science* the publications of the year are numerous and valuable. A large portion of these are new and revised editions, or works rewritten under additional light and larger experience. Drs. G. M. Beard and A. D. Rockwell present "Medical and Surgical Uses of Electricity," in a third revised edition (New York, William Wood & Co.). Dr. Austin Flint, Sen., gives a new edition of his "Principles and Practice of Medicine" (Philadelphia, H. C. Lea's Son & Co.), and Dr. A. Flint, Jr., a new edition of the "Text-Book of Human Physiology" (New York, D. Appleton & Co.). Dr. T. S. Kirkbride's "Insanity, and Hospitals for the Insane" (Philadelphia, Lippincott & Co.) appears in a second edition. The second volume of Dr. D. Hayes Agnew's great treatise on "The Principles and Practice of Surgery" (Philadelphia, J. B. Lippincott & Co.) is among the noteworthy books of the year; as is also a translation of Dr. Just Lucas-Championnière's work entitled "Antiseptic Surgery: the Principles, Modes of Application, and Results of the Lister Dressing" (Portland, Maine, Loring, Short & Harmon). The translator and editor of the volume, Dr. F. H. Gerrish, is quite enthusiastic in support of the views set forth in the work. A very interesting and valuable publication is by Dr. R. Bartholow, "On the Antagonism between Medicines and between Remedies and Diseases" (New York, D. Appleton & Co.). Dr. J. Tyson's "Treatise on Bright's Disease and Diabetes, with Special Reference to Pathology and Therapeutics" (Philadelphia, Lindsay & Blakiston) is timely and important; it has also a section on retinitis in Bright's disease, added by Dr. W. F. Norris. Drs. J. B. Bell and W. T. Laird give a new edition of "Homoëopathic Therapeutics of Diarrhœa, Dysentery, Cholera," etc. (New York, Boericke & Tafel). Dr. W. A. Hammond has brought out a seventh and revised edition of his work "On the Dis-

cases of the Nervous System" (New York, D. Appleton & Co.). Dr. W. H. Byford's "The Practice of Medicine and Surgery applied to the Diseases and Accidents incident to Women" (Philadelphia, Lindsay & Blakiston) is a work of great value, as revised and largely rewritten. In the same connection comes also Dr. F. A. Purcell's valuable treatise "On Cancer, its Allies and other Tumors, with Special Reference to Treatment" (same publishers). Dr. Bulkley's work on "Eczema and its Management" (New York, Putnam's Sons) is thorough and important, in view of the interest of the faculty in cutaneous disorders at the present time. Other works, which deserve to be mentioned here with approbation, are—Dr. W. T. Lusk's "Science and Art of Midwifery" (New York, D. Appleton & Co.); Dr. H. H. Kane's "Drugs that Enslave," the opium, morphine, and chloral habit (Philadelphia, Blakiston); Dr. R. Glisan's "Modern Midwifery," a text-book of American practice (same publisher); Dr. A. L. Ranney's "The Applied Anatomy of the Nervous System" (New York, D. Appleton & Co.). The same publishers issue "The New York Medical Journal and Obstetrical Review," edited by Dr. F. P. Foster; and F. Leyppoldt (New York) sends out the "Index Medicus," a monthly record of medical publications.

American literature is fairly represented in works on *Law and Government*. Codes of the different States, digests, statutes, etc., are increasing in number and value from year to year, and American jurisprudence is assuming high importance in the estimation of foreign civilized nations. The Reports of the Supreme Court of the United States, and of the Supreme Courts and Courts of Appeals of the several States, and the volumes (some thirty in number) containing the "American Decisions" are looked for with great interest, and are of special moment to the educated lawyer. A "Treatise on the Law of Injunctions" by J. I. High (Chicago, Callaghan & Co.), has reached a second edition, and is a work of merit. So, also, is F. A. Lewis's volume, "Law relating to Stocks, Bonds, and other Securities" (Philadelphia, Rees, Welsh & Co.). B. R. Curtis's very valuable work, "Jurisdiction, Practice, and Peculiar Jurisprudence of the Courts of the United States" (Boston, Little, Brown & Co.), has been enriched with notes by G. T. and B. R. Curtis. Of equal, if not superior, value is J. N. Pomeroy's "Treatise on Equity Jurisprudence as administered in the United States" (San Francisco, A. L. Bancroft & Co.). It is adapted for all the States, and to the union of equitable and legal remedies under the reformed procedures. O. W. Holmes, Jr., has written a thoughtful and interesting book entitled "The Common Law" (Boston, Little, Brown & Co.); and the same publishers send out E. L. Pierce's important "Treatise on the Law of Railroads." Professor F. Wharton's "Treatise on the Conflict of Laws" is extremely suggestive, and is in its second edition.

(Philadelphia, Kay & Brothers). J. F. Dillon's "Removal of Causes from State Courts to Federal Courts" (St. Louis, W. H. Stevenson) is supplied with forms adapted to the several acts of Congress, in an enlarged and revised edition. J. C. Hurd's "Theory of our National Existence, as shown by the Action of the Government of the United States since 1861" (Boston, Little, Brown & Co.), commands attention no less from the importance of the subject than the skill and ability with which the author has treated it. Among popular manuals we name a few: F. Crosby's "Everybody's Lawyer and Book of Forms" (Philadelphia, J. E. Potter & Co.); J. G. Lee's "Hand-Book for Coroners," containing a digest of all the laws in the thirty-eight States of the Union (Philadelphia, W. Brotherhead); S. D. Thompson's "Liability of Directors and other Officers and Agents of Corporations" (St. Louis, W. H. Stevenson); "Notaries' and Commissioners' Manual" (New York, Baker, Voorhees & Co.); F. J. Stimson's "Glossary of Technical Terms, Phrases, and Maxims of the Common Law" (Boston, Little, Brown & Co.); and F. F. Heard's "Oddities of the Law" (Boston, Soule & Bugbee).

In *Biography, Memoirs*, and the like, the present year is not less prolific than its predecessors. The Rev. Dr. E. E. Beardsley's "Life and Correspondence of Rev. Samuel Seabury" (first bishop in the Protestant Episcopal Church in the United States) is a valuable contribution to history as well as literature (Boston, Houghton, Mifflin & Co.). J. B. Gough, in his "Sunlight and Shadow" (Hartford, Conn., A. D. Worthington & Co.), gives some interesting gleanings from his life-work in the cause of temperance. Dr. A. Stevens presents, in his "Madame de Staël: A Study of her Life and Times" (New York, Harper & Brothers), a vivid portraiture of the first French Revolution and the First Empire. It is a work of solid merit, as well as of unflagging interest. The same publishers send out J. W. Forney's amusing and instructive "Anecdotes of Public Men." Miss M. A. Lamson's "Life and Education of Laura Dewey Bridgman, the Deaf, Dumb, and Blind Girl," loses none of its interest in a new edition (Boston, Houghton, Mifflin & Co.). R. W. Johnson contributes an admirable "Memoir of Major-General George H. Thomas" (Philadelphia, Lippincott & Co.). After long and careful study, James Parton brings out his elaborate "Life of Voltaire" (Boston, Houghton, Mifflin & Co.). It already takes its place as a standard in this department. General A. Badeau completes, in a third volume, the "Military History of Ulysses S. Grant, from April, 1861, to April, 1865" (New York, D. Appleton & Co.). The substantial merit of the work is recognized on all hands. R. H. Conwell gives a pleasing and useful account of "The Life, Travels, and Literary Career of Bayard Taylor" (Boston, Lothrop). Messrs. J. M. Bundy, in his "The Nation's Hero, in Memo-

riam, Life of James Abram Garfield, Twentieth President of the United States" (New York, Barnes), and J. S. Ogilvie, in his "Life and Death of James A. Garfield, from Tow-path to the White House" (New York, Ogilvie), give popular sketches of the late President, whose cruel murder, and the trial of whose assassin, excited public attention throughout the civilized world.

In the way of republication, numerous works of value are added to American literature. F. W. H. Myers's "William Wordsworth" is one of the most interesting and successful volumes of the series "English Men of Letters" (New York, Harper & Brothers). In the same series, S. Colvin gives a thoughtful study of "Landon" and his works; and Professor D. Masson performs a like service for "De Quincey" and his singularly interesting career. Other serial works show the tendency of biographical literature in 1881. Mrs. Oliphant's "Cervantes," and W. L. Collins's "Butler" (Philadelphia, Lippincott), are valuable contributions to "Foreign and Philosophical Classics for English Readers." F. W. Trollope, the novelist, tries his hand upon a "Life of Cicero," and succeeds very well, all things considered (New York, Harper & Brothers). Mme. De Witt, daughter of the statesman and historian, gives a pleasant narrative of "Monsieur Guizot, in Private Life" (Boston, Estes & Lauriat). Messrs. Shepherd and Williamson furnish the admirers of the Scotch celebrity with "Memoirs of the Life and Writings of Thomas Carlyle," giving personal reminiscences and selections from his private letters (New York, Scribner & Welford). Dr. W. G. Blaikie writes with enthusiasm and force of "The Personal Life of David Livingstone" (New York, Harper & Brothers), and Canon Carus supplies "Memorials of the Rev. Charles Pettit McIlvaine, Bishop of Ohio (New York, Whittaker). From the French of Eugene Muntz we have "Raphael, his Life, his Works, and his Times" (New York, A. C. Armstrong & Son), a very elegantly illustrated work.

In this connection we may properly name several other works of merit in the department of literary history and culture: Miss L. E. Poor's "Sanskrit and its Kindred Literatures," being studies in comparative mythology (Boston, Roberts); R. G. White's "American View of the Copyright Question" (New York, Routledge); a new uniform edition of J. R. Lowell's "Complete Works" (Boston, Houghton, Mifflin & Co.); W. Matthews's "Literary Style, and other Essays" (Chicago, S. C. Griggs & Co.); Horace Bushnell's "Literary Varieties," and "Moral Uses of Dark Things" (New York, Scribner's Sons); O. B. Bunce's charming volume, "Bachelor Bluff, his Opinions, Sentiments, and Disputations" (New York, D. Appleton & Co.); Professor M. C. Tyler's "History of American Literature, Colonial Period, 1607-1765" (New York, Putnam's Sons); and new editions of J.

G. Holland's popular prose and poetical works (New York, Scribner's Sons). To these should be added, "The Dhammapada," being one of the canonical books of the Buddhists, translated from Pāli, by F. Max Müller; with others, forming part of the "Sacred Books of the East," translated by various Oriental scholars, and edited by Müller (New York, Macmillan & Co.); from the same publishers, W. Y. Sellar's "Roman Poets of the Republic," and J. Watson's "Kant and his English Critics," being a comparison of critical and empirical philosophy; and, as of special value, Sir G. W. Cox's "Introduction to the Science of Comparative Mythology and Folk Lore" (New York, Holt).

No very important work on *History*, of American authorship, has appeared during 1881. Local histories are numerous and valuable, and outline sketches and books for schools are in abundance. Mr. Bancroft's long-promised volumes, "History of the Formation of the Constitution of the United States," forming a history of the United States from the Treaty of Peace with Great Britain to the Inauguration of Washington, are handed over to the succeeding year. Professor H. Coppée furnishes an interesting and useful "History of the Conquest of Spain by the Arab-Moors" (Boston, Little, Brown & Co.). T. T. Timayenis is author of a "History of Greece, from Earliest Times to the Present," a useful compilation (New York, D. Appleton & Co.). H. C. Lodge gives his countrymen a work of unique interest and value, entitled "A Short History of the English Colonies in America" (New York, Harper & Brothers). R. Blanchard's "Discovery and Conquests of the Northwest" (Chicago, Cushing, Thomas & Co.) occupies a field of great importance; and Jefferson Davis's "Rise and Fall of the Confederate Government" (New York, D. Appleton & Co.) is a work variously estimated as to its value and help toward a right and just settlement of American history. The writer concludes his second volume as follows:

In asserting the right of secession, it has not been my wish to incite to its exercise: I recognize the fact that the war showed it to be impracticable, but this did not prove it to be wrong; and, now that it may not be again attempted, and that the Union may promote the general welfare, it is needful that the truth, the whole truth, should be known, so that extermination and reextermination may for ever cease, and then, on the basis of fraternity and faithful regard for the rights of the States, there may be written on the arch of the Union, *Esto perpetua*.

H. P. Johnston's "The Yorktown Campaign and Surrender of Cornwallis" (New York, Harper & Brothers) is a very carefully prepared narrative, in both good taste and temper. Several volumes on "The Campaigns of the Civil War" are promised; we name two: M. F. Force's "From Fort Henry to Corinth," and J. G. Nicolay's "Outbreak of the Rebellion" (New York, Scribner's Sons). H. Von Holst's elaborate work on "The Constitution

and Political History of the United States," from the German (Chicago, Callaghan), has reached a third volume. It is a work of superior merit. From the veteran worker in American history, B. J. Lossing, we have "Harper's Popular Cyclopædia of United States History," marked by his usual care and industry.

In *Education, Language*, etc., there is a goodly supply of native productions, together with about the usual number of reprints. Text-books in the ancient classics, in Hebrew and Oriental tongues, and in modern languages, are quite in abundance, in fact too abundant to specify to any advantage. R. H. Ball's "Elements of Astronomy" (New York, D. Appleton & Co.) is one of a valuable series entitled "Text-Books of Science." The same publishers issue a text-book for normal schools, entitled "Art of School Management." J. Ogden's "Science of Education, or Philosophy of Human Culture" (Cincinnati, Van Antwerp & Co.), is a thoughtful and suggestive publication. Alfred Ayres has issued a companion volume to "The Orthoëpist" of last year, entitled "The Verbalist" (New York, D. Appleton & Co.). It is a capital little volume. J. E. Worcester's "Dictionary of the English Language" (Philadelphia, Lippincott) appears in a new edition, with a valuable supplement. This great work disputes with Webster the place of being "the standard" of the English tongue, and many think successfully. W. H. Payne reprints from the "Encyclopædia Britannica" the valuable article on "Education," entitling it "A Short History of Education," with notes, etc. (Syracuse, New York, O. W. Bardeen); it is interesting and useful to the general reader. L. T. Townsend's "The Art of Speech, Studies in Eloquence and Logic" (New York, D. Appleton & Co.), is a serviceable little work. H. Kiddle and A. J. Schem furnish a useful and valuable "Dictionary of Education" (New York, Steiger), based upon the larger work, "Cyclopædia of Education." J. F. McCurdy's "Aryo-Semitic Speech" (Andover, Massachusetts, W. F. Draper) is a very interesting study in linguistic archæology. Among English books of note in this department are, J. G. Fitch's "Lectures on Teaching, delivered in the University of Cambridge"; and H. Kiepert's "Manual of Ancient Geography," being the authorized translation from the German (New York, Macmillan & Co.).

The interest in *Political Economy and Social Science* is fully as great as in any preceding year, and several valuable contributions to this department are the result. G. F. Seward (late American minister to China), in his "Chinese Immigration in its Social and Economical Aspects" (New York, Scribner's Sons), discusses the question which has agitated largely the people on our Pacific coast. It is a timely and valuable publication. Henry George's "Irish Land Question" (New York, D. Appleton & Co.) undertakes to show, with much ability, what this question involves, and how alone it

can be settled. He makes an earnest appeal to the land leagues. Mrs. H. Jackson, in a volume entitled "A Century of Dishonor" (New York, Harper & Brothers), presents a terrible indictment against the United States Government's dealings with some of the Indian tribes. She makes out her case only too well, and causes one's ears to tingle with shame at the unprincipled conduct of our Government in past years toward the aborigines. C. Barnard's "Co-operation as a Business" (New York, Putnam's Sons) discusses, in an able manner, this important element in economic science at the present day. Mrs. D. M. Craik gives "A Woman's Thoughts about Women" (New York, G. Munro), with admirable freshness and point. Herbert Spencer's "Descriptive Sociology, or Groups of Sociological Facts, classified and arranged" (New York, D. Appleton & Co.), is steadily advancing toward completion. No. 7, Division II, Part II, B, treats of the Hebrews and Phœnicians. P. C. Centz's "The Republic of Republics, or American Federal Liberty" (Boston, Little, Brown & Co.), appears in a fourth edition, and is a very able work. Mrs. A. G. Paddock's "The Fate of Madame La Tour, a Tale of Great Salt Lake" (New York, Fords, Howard & Hurlbert), though cast in the form of a novel, yet displays with great force and success what a foul blot and burning disgrace Mormonism and its abominations are in this nineteenth century. W. Hickey's "Constitution of the United States" (Baltimore, J. Murphy & Co.) is a valuable manual of political information, as revised by A. Cummins and brought down to date. F. Martin furnishes "The Statesman's Year-Book" (New York, Macmillan & Co.), containing statistical and historical records of the states of the civilized world for 1881. The same publishers bring out Sir J. B. Phear's "International Trade, and the Relation between Exports and Imports." It is concise, but able and interesting. Thomas Pitt Taswell-Langmead's "English Constitutional History, from the Teutonic Conquest to the Present Time" (Boston, Houghton, Mifflin & Co.), is worthy of mention in this connection. It appears in a second edition, with additions and improvements. From English sources also, we get Luigi Cossa's "Guide to the Study of Political Economy" (New York, Macmillan & Co.); it is translated from the second Italian edition, and is a clear and well-arranged work.

In *Poetry*, the *Drama*, etc., there is little of special moment in the productions of 1881. Hardly anything original or new appears; while compilations and collections of poetry, and new editions of standard poets, American and English, are numerous and excellent. Mrs. D. M. Craik's "Thirty Years" contains "poems new and old," and is a charming volume; H. W. Longfellow appears in the "Seven Voices of Sympathy," selected from his works by Charlotte F. Bates; O. W. Holmes's "Poetical Works" are issued in a new handy-volume

edition; J. G. Whittier presents us with "The King's Missive, and other Poems"; Bayard Taylor's "Home Ballads" keep alive his genial memory; and T. B. Aldrich sends out his "Friar Jerome's Beautiful Book, and other Poems" (all these published by Houghton, Mifflin & Co.). T. Buchanan Read also adds to this list of home productions his pleasing poem, entitled "Brushwood" (Philadelphia, Lippincott & Co.). C. De Kay's "Vision of Nimrod" (New York, D. Appleton & Co.) is an Oriental romance, on the whole very well worked out. The same publishers give us Dr. A. Coles's "The Microcosm, and other Poems." Will Carleton's "Farm Festivals" (New York, Harper & Brothers) is full of interest and instruction. A collection of poems entitled "Green Mountain Poets" (Boston, Lee & Shepard) illustrates very capitally the best talent in the Green Mountain State. Dr. P. Schaff and A. Gilman furnish a valuable work, under the title of "Library of Religious Poetry" (New York, Dodd, Mead & Co.). D. R. Locke (P. V. Nasby) makes a new contribution, in his peculiar line, entitled "Hannah Jane" (Boston, Lee & Shepard). H. N. Hudson's "Complete Works of William Shakespeare" (Harvard edition, Boston, Ginn & Heath) is a very admirable exhibition of literary skill, devotion, and ability; this edition takes rank of all others by American hands, in its full and genial life of the poet, its capital notes, its full glossary, etc. A. C. Swinburne's "Mary Stuart," and "Studies in Song" (New York, Worthington) come to us from abroad, as do several other contributions to poetic literature; viz., Jean Ingelow's "Poems" (Boston, Roberts Brothers); F. R. Havergal's "Poems" (New York, E. P. Dutton & Co.); T. H. Ward's "The English Poets, Selections with Critical Introductions by Various Writers, and a General Introduction by Matthew Arnold"; and A. W. Ward's "English Dramatic Literature to the Death of Queen Anne" (New York, Macmillan & Co.).

As a specialty, *Art*, the *Fine Arts*, *Music*, etc., occupy a fair space in the literary record of 1881. P. G. Hamerton's "Graphic Art" (New York, J. W. Bouton) appears in a splendid edition; "Art Essays" No. 2, "Modern Schools of Art, American and European" (New York, Barnes), are from the same author. Mrs. C. E. Clement's "Hand-Book of Legendary and Mythological Art"; "Painters, Sculptors, Architects, Engravers, and their Works" (Boston, Houghton, Mifflin & Co.), appear in new editions. C. C. Abbott furnishes a very interesting and useful work, entitled "Primitive Industry, or Illustrations of the Handiwork in Stone, Bone, and Clay, of the Native Races of the Northern Atlantic Seaboard of America" (Salem, Massachusetts, G. A. Bates). Julia B. De Forest supplies an excellent "Short History of Art" (Dodd, Mead & Co.); and the same publishers issue the standard work of Wilhelm Lübke, "Outlines of the History of

Art," being a new translation from the seventh German edition, edited with notes by Clarence Cook. S. G. W. Benjamin gives a very readable account of "Our American Artists" (Boston, Lothrop), including painters, sculptors, etc. A pleasant volume, by Mrs. J. A. Shedd, is entitled "Famous Painters and Paintings" (Boston, Osgood & Co.), and appears in a third edition, revised and enlarged. President Bascom's "Æsthetics, or the Science of Beauty," is timely and suggestive. Of works from English and Continental sources a few are here named: A. S. Murray's "History of Greek Sculpture, from the Earliest Times down to the Age of Phidias" (New York, Scribner & Welford); E. E. Viollet-le-Duc's "Discourses on Architecture," from the French (Boston, Osgood & Co.); G. G. Scott's "Essay on the History of English Church Architecture prior to the Separation of England from the Roman Obedience" (New York, Scribner & Welford); J. Von Falke's "Greece and Rome, their Life and Art" (New York, Holt); M. B. Huish's "The Year's Art, 1881" (New York, Macmillan & Co.), being an epitome of all matters relating to painting, sculpture, etc., during 1880, in the United Kingdom; and R. Schumann's "Music and Musicians, Essays and Criticisms" (New York, E. Schuberth & Co.).

Works of *Travel, Description, and Adventure* are unusually numerous and valuable this year. W. H. Gilder's "Schwatka's Search, Sledging in the Arctic in quest of the Franklin Records" (New York, Scribner's Sons), is intensely interesting, and very suggestive in connection with that strangely infatuating desire men have to reach the north pole. Paul du Chaillu's "The Land of the Midnight Sun" (New York, Harper & Brothers) is even more full of interest and profitable instruction, as relating to a land and people worthy of the commendation Du Chaillu bestows upon them. J. L. Hayes's "Pictures of Arctic Travel" (New York, Carleton) deserve mention in this connection. Miss Isabella Bird's "Unbeaten Tracks in Japan" (New York, Putnam's Sons) gives, in a third edition, a graphic account of her travels in the interior, including visits to the aborigines of Yezo and Isé; and W. A. P. Martin, in a compact and carefully prepared volume, describes "The Chinese, their Education, Philosophy, and Letters." Two of the most attractive and valuable works on "the Dark Continent" appear in translations, viz., Emil Holub's "Seven Years in South Africa: Travels, Researches, and Hunting Adventures between the Diamond-fields and the Zambesi, 1872-'79" (Boston, Houghton, Mifflin & Co.); and Alexander da Serpa Pinto's "How I crossed Africa; from the Atlantic to the Indian Oceans through Unknown Countries, and Discovery of the Great Zambesi Affluents" (Philadelphia, Lippincott & Co.). To these add L. M. D'Albertis' "New Guinea, what I did and what I saw" (Boston, Houghton, Mifflin & Co.); R. S. Watson's "Visit to

Wazan, the Sacred City of Morocco" (New York, Macmillan & Co.); and L. Oliphant's "The Land of Gilead, with Excursions in the Lebanon" (New York, D. Appleton & Co.). The same publishers are issuing "Picturesque Palestine," with an introduction by Dean Stanley, and descriptive matter from eminent Palestine scholars and explorers. Parts one to twenty are published. D. C. Poole's "Among the Sioux of Dakota" furnishes a very instructive account of eighteen months' experience as an Indian agent (New York, Van Nostrand). Lady Duffus Hardy's "Through Cities and Prairie Lands" (New York, Worthington) is an attractive volume. J. Hatton's "To-day in America" (New York, Harper & Brothers) contains some capital studies for the Old World and the New; and A. E. Silliman, in his "Gallop among American Scenery" (New York, Barnes), gives numerous lively sketches of American scenes and military adventure. As a return compliment for our English cousins' visits and remarks, Grant White deals most effectively with the subject in his "England Without and Within" (Boston, Houghton, Mifflin & Co.). S. A. Drake's "The Heart of the White Mountains" (New York, Harper & Brothers) is replete with interesting and valuable matter. E. de Amicis's "Spain and the Spaniards," from the Italian (New York, Putnam's Sons), is a book of rare merit; and the historian E. A. Freeman's "Sketches from the Subject and Neighbor Lands of Venice" (New York, Macmillan & Co.) are marked by all the author's well-known scholarship and ability.

Juvenile books are very numerous this year, and many of them are unusually excellent and appropriate. We name only a few: "The Golden Book of Tales," selected and edited by Messrs. W. Swinton and G. R. Cathcart (New York, Iverson & Co.), is a most charming volume, and contains a choice collection of holiday readings for boys and girls. Of similar character and interest are, H. E. Scudder's "The Children's Book, a Collection of the Best and Most Famous Stories and Poems in the English Language" (Boston, Houghton, Mifflin & Co.); "Our Little Ones," and "Young Folks at Home," by W. T. Adams (Boston, Lothrop), containing illustrated stories and poems; Mrs. H. B. Stowe's "Queer Little People" and other volumes of stories (New York, Fords); and S. A. Drake's "Around the Hub," a boys' book about Boston (Boston, Roberts). T. W. Knox's "The Boy Travelers in the Far East" (New York, Harper & Brothers) is a thrilling narrative of the adventures of two youths in a journey to Ceylon and India, with a description of Borneo, the Philippine Islands, and Burmah. W. Hauff's "Arabian Days' Entertainment" (Boston, Houghton, Mifflin & Co.), and "Tales of the Caravan, Inn, and Palace," both from the German (Chicago, Jansen, McClurg & Co.), are well worth reading; and Mme. Guizot de Witt's "Tales of Three Centuries," from the French

(Boston, J. Bradley & Co.), deserve the highest praise. In the same connection may be named J. R. Gardiner's "English History for Young Folks, B. C. 55-A. D. 1880," in a revised edition for American students (New York, Holt). J. Otis's "Toby Tyler, or Ten Weeks with a Circus," and W. L. Alden's "Cruise of the Ghost" (New York, Harper & Brothers), are first-rate stories for boys. Miss L. E. Guernsey's "The Foster Sisters, or Lucy Corbet's Chronicle" (New York, Whittaker), is one of the best stories of the year for both boys and girls.

The literature of *Fiction*, as a comparison with last year shows, is as attractive as ever, and the supply keeps pace with the demand. American authors, too, hold their own in this department, and divide the honors with English and Continental writers. As productions of this kind number by the hundreds, it is of course impossible to do more than give a glance at a few of the noteworthy novels and stories of 1881. Henry James's "The Portrait of a Lady" (Boston, Houghton, Mifflin & Co.) is much admired, and also much criticised. Mrs. F. H. Burnett's "A Fair Barbarian" well sustains the writer's reputation (Boston, Osgood & Co.). The same publishers issue Miss R. T. Cooke's "Somebody's Neighbors," and W. D. Howells's "Dr. Breen's Practice," and "A Fearful Responsibility," each very effective in its way. Miss L. M. Alcott's "Little Women" series (Boston, Roberts Brothers), comprising eight volumes, appears in a new edition, and maintains its high place in American fiction. Rev. W. Baker's "Blessed Saint Certainty" (Boston, Roberts Brothers) graphically presents scenes and characters from frontier life; and "Cape Cod Folks," by Miss McLean (Boston, Williams & Co.), is really unique, and in some respects the best novel of the year. "The Bloody Chasm," by J. W. De Forest, and "Wild Work, the Story of the Red River Tragedy," by Mary E. Bryan (New York, D. Appleton & Co.), are pictures of American manners and events, and are full of exciting interest. E. P. Roe's "Without a Home" (New York, Dodd, Mead & Co.) is, like all his stories, written with a distinct purpose, and points out the terribly pernicious effects of the opium-habit.

A large number of novels by English writers are, as usual, republished in the United States. George MacDonald, a writer of rare power as an analyst and portrayer of character, furnishes this year "Mary Marston" (D. Appleton & Co.) and "Warlock O'Glenwarlock" (New York, Harper & Brothers). From the latter house also are sent out W. Besant and J. Rice's "Chaplain of the Fleet," a curiously interesting story of the condition of matters a hundred years ago in a well-known district in London; W. Black's "Sunrise" and "The Beautiful Wretch," both sustaining his well-earned reputation as a novelist; and R. D. Blackmore's "Christowell," a story of unusual power. W.

Mallock writes "A Romance of the Nineteenth Century," and in it presents a strikingly realistic picture of existing social conditions; Mrs. K. S. Macquoid gives a pleasing story in "Esau Runswick"; and D. C. Murray presents us with a somewhat singular production entitled "Joseph's Coat" (these published by Putnam's Sons).

Translations of works of fiction are very numerous. Victor Cherbuliez's "Saints and Sinners" (*Noirs et Rouges*) is a capital specimen of French life and manners (New York, D. Appleton & Co.); so also is André Theuriot's "All Alone"; F. Spielhagen's "Lady Clara Vere de Vere" well represents the popular German style of novel (same publishers). The "Spanish Fairy Tales" of Fernan Caballero are presented in a capital rendering into English by J. H. Ingram; Mrs. A. L. Wister translates from the German "The Eichoffs" of Von Reichenbach, and "Severa," a novel of E. Hartner's (Philadelphia, Lippincott & Co.). H. H. Boyesen's "Queen Titania" and "Tales of Two Hemispheres" (New York, Scribner's Sons) are stories of real merit. Professor R. B. Anderson has translated, with the approval of the author, Björnson's delightful "Synnöve Solbakken," "Arne," and "A Happy Boy" (Boston, Houghton, Mifflin & Co.). The same scholar gives us, from the Icelandic, the Viking Tales of the North, i. e., "The Sagas of Thorstein, Viking's Son, and Fridthjof the Bold" (Chicago, S. C. Griggs & Co.). George Ebers's "Uarda, a Romance of Ancient Egypt," is a singularly striking production, carrying one back into hoar antiquity. Jules Verne, one of the most industrious and useful writers of our day, gives us "The Steam House, Part I, The Demon of Cawnpore," and "Part II, Tigers and Traitors" (New York, Scribner's Sons). From the French also comes "A Nihilist Princess," by M. L. Gagneur (Chicago, Jansen, McClurg & Co.), and A. de Lamartine's "Graziella, a Story of Italian Love," new edition (same publishers).

LITERATURE, BRITISH, IN 1881. Literature in Great Britain, in 1881, does not display equal activity with American literature during the same period. As we have shown on a previous page, literature in the United States is steadily increasing in almost every department of knowledge, there being about one thousand more books noted in "The Publishers' Weekly" for 1881 than for the year 1880. In England, however, according to "The London Publishers' Circular," there is a marked falling off, seeing that three hundred volumes less are recorded as being published in 1881 than in 1880. This decrease is attributed mainly to the great development of the periodical press, and the immense increase in the number and variety of daily, weekly, and monthly papers and magazines. No doubt, there is force in this statement, and we give it for what it is worth. At the same time it is worthy of note that this very cause, operating

in this country, if it has been effective at all, has produced a directly contrary result. In certain departments, such as science, travel and adventure, fiction, British literature seems to be as active as ever; and there is little or no diminution in works devoted to the discussion of critical and crucial questions of the day.

In *theological* and *religious* literature there is not much of moment to be noted. The Rev. T. K. Cheyne, in his "The Prophecies of Isaiah" (London, C. Kegan Paul & Co.), gives a new translation, together with a commentary and appendices. Mr. Cheyne is a follower of Ewald, the famous German critic, and has made the writings of Isaiah his special study. Dr. E. H. Plumptre contributes to the useful series, "The Cambridge Bible for Schools," a volume on "Ecclesiastes, or the Preacher." It is a charming work, replete with scholarship and high literary culture. The last two volumes of "The Speaker's Commentary on the New Testament" (London, John Murray), edited by Canon F. C. Cook, quite sustain the reputation of the preceding volumes. Some of the ablest talent and learning of the English Church finds place in this now completed work. Dr. W. Milligan, Professor in the University of Aberdeen, is author of a very valuable work on "The Resurrection of our Lord" (Macmillan & Co.). It ranks among the best productions of the year. "The New Testament in the Original Greek," vol. i, Text; vol. ii, Introduction and Appendix (Macmillan & Co.), we have before alluded to, in connection with the revised version of the New Testament. The service which Drs. Westcott and Hort have here rendered to the best interests of biblical learning and criticism is beyond all praise. Under the title "Everlasting Punishment," being lectures delivered in London, Dean E. M. Goulburn furnishes a very timely and weighty contribution to the question which Canon Farrar, Dr. Pusey, and others have been discussing of late years. The second edition (London, Rivingtons) is revised and enlarged. Canon H. M. Luckok's "Studies in the History of the Book of Common Prayer" (Rivingtons) exhibits excellent scholarship and ability. It is a volume of superior merit on this topic. "The Old Testament in the Jewish Church" (Edinburgh, A. & C. Black) is the title of W. Robertson Smith's somewhat famous lectures on biblical criticism. These lectures are well known in America, and are variously esteemed by students of the orthodox or more liberal denominations. In this connection it should be stated that Dr. Littledale's "Plain Reasons against joining the Church of Rome" (Christian Knowledge Society) was found to be so severe and telling adversely to the Roman claims and assumptions, that it was necessary to provide an answer. This is supplied by Father Ryder, of the Oratory, in a small volume like Littledale's, entitled "Catholic Controversy: a Reply to Dr. Littledale's Plain Reasons" (London, Burns & Oates). It is acute

and able. Dr. J. Cairns's "Unbelief in the Eighteenth Century" (Edinburgh, Black) is a volume of moderate size, and is, on the whole, a useful if not very profound contribution to apologetics at the present day.

In *History* there are no special triumphs to record, no works of any great importance having appeared. Professor G. Rawlinson's "History of Ancient Egypt" (Longmans) is a work of real value, and forms a fitting companion to his most important production, "The Five Great Monarchies of the Ancient World." J. A. Froude's "English in Ireland" (Longmans) appears in a new edition, to which Mr. F. has appended a concluding chapter dealing with Irish politics in the present day. "Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII," vol. v, arranged and catalogued by James Gairdner (Longmans), form a part of the valuable series of state papers begun by the late Dr. Brewer, Master of the Rolls. The present volume is admirably arranged and edited. Similar in character is the "Calendar of State Papers," relating to Ireland in the reign of James I, edited by Dr. C. M. Russell and J. P. Prendergast. F. W. Longman, in his "Epochs of History," gives a very readable and carefully prepared account of "Frederick the Great and the Seven Years' War." The Hakluyt Society sends out, as its latest issue, Father F. Alvarez's "Narrative of the Portuguese Embassy to Abyssinia during the Years 1520-27." It is translated by Lord Stanley of Alderley, and is an excellent addition to material for history. S. R. Gardiner and J. B. Mullinger, in their "Introduction to English History" (C. Kegan Paul & Co.), show forth the best fruits of sound judgment, scrupulous accuracy, and strict impartiality. The list of authorities is particularly valuable. In this connection E. A. Freeman's "Historical Geography of Europe" (Longmans) deserves special mention. It is worthy of his high reputation, and is a positive gain to historical and political science. The volume of maps accompanying adds not a little to the value and interest of the work. The first volume of C. A. Fyfe's "History of Modern Europe" begins at the outbreak of the Revolutionary War, in 1792, and extends to the accession of Louis XVIII, in 1814. It is a vigorous and brilliant sketch, and promises well for the character and value of the volumes yet to come.

The *Biography* of the year is, as in previous years, varied and unusually full. John Morley, in his "Life of Richard Cobden" (Chapman & Hall), has furnished a very satisfactory memoir of the statesman, and made also an excellent addition to contemporaneous history and politics. Mrs. Harcastle writes a life of her father, "John, Lord Campbell" (John Murray), being a selection from his autobiography, diary, and letters. It is a work of real merit. P. Fitzgerald's "Life of George IV" (Tinsley Brothers) gives pretty fully that

monarch's letters and opinions, and goes quite at large into a view of the men, manners, and politics of his reign. The subject of the memoir is of so unsavory a reputation that it is a matter of regret to find so much time and labor expended in preparing an account of his life and excesses. Living statesmen appear in Barnett Smith's "Life and Speeches of the Rt. Hon. John Bright, M. P." (Hodder & Stoughton). This, like his previous work, "Life of W. E. Gladstone," is a valuable and timely production. An interesting contribution to biographical literature is the third and concluding volume of "The Letters of Charles Dickens" (Chapman & Hall). Professor E. H. Palmer does excellent service in giving anew an account of the Caliph "Haroun Alraschid," of "Arabian Nights" notoriety (Marcus Ward & Co.). Numerous biographies of noted philosophers are among the valuable productions of the year. Professor Mahaffy's "Descartes" (Blackwood & Sons) is one of the best of these. To the series in which it appears, "Philosophical Classics for English Readers," belong "Bishop Butler," by W. L. Collins, and "Bishop Berkeley," by Professor Fraser. Both are useful and well done. In another series, "English Philosophers" (Sampson, Low & Co.), appear "Sir William Hamilton," by Professor W. H. S. Monck; "Adam Smith," by J. A. Farrer; "Hartley and James Mill," by G. S. Bower; and "Bacon," by Professor Fowler, the last being an unusually careful and satisfactory work. Valuable additions also are made to "English Men of Letters," in the volumes of this year, viz., G. Saintsbury's "Dryden"; F. W. H. Myers's "Wordsworth"; Professor S. Colvin's "Landor"; and Professor Masson's "De Quincey" (Macmillan & Co.). Nearly everything valuable in the department of biography is republished in the United States, and forms a part of American as well as British literature.

In the line of *Travel and Adventure* English men and women have shown themselves to be quite as active, daring, and persevering as their transatlantic cousins. Lady Anna Blunt gives "A Pilgrimage to Nejd, the Cradle of the Arab Race," etc. (Murray), a very interesting and instructive narrative of personal experiences and keen, shrewd observation. "To the Central African Lakes and Back" (Sampson, Low & Co.), by Joseph Thomson, is a well-told story, of both great interest in itself and also of superior value for enlarging our knowledge of the geography of Africa. G. B. Hill's volume, "Colonel Gordon in Central Africa, 1874-'79" (De La Rue & Co.), is a fitting tribute to a distinguished philanthropist and traveler in the dark regions of the world. One of the most amusing books of adventure in the year's list is T. F. Keane's "Six Months in Mecca" (Tinsley Brothers). The writer is a young Englishman, who took the name of Hajj Mohammed Amin, passed himself off as a believer, and enjoyed rare opportunities for

seeing and hearing, under circumstances where no avowed Christian would be tolerated for a moment. The same writer's "My Journey to Medinah" is equally amusing, and displays an energy, *sang-froid*, and power of description that are almost irresistible. W. F. Rae, in his "Newfoundland to Manitoba" (Sampson, Low & Co.), furnishes a useful and attractive "Guide through Canada's Maritime, Mining, and Prairie Provinces." The accompanying maps and illustrations increase its value. Joseph Hatton's "To-Day in America" (Chapman & Hall) is lively and entertaining, as showing an intelligent Englishman's views of matters and things in the New World. Baron A. E. von Norden-skiöld's "The Voyage of the Vega round Asia and Europe" (Macmillan & Co.), translated by Alexander Leslie, furnishes the English reader with the valuable results of the famous Swedish navigator's labors in behalf of the literature of travel and discovery. The engraved portraits, the very numerous illustrations, the maps, etc., render these two volumes as unique as they are serviceable. The Hon. H. N. Shore's "The Flight of the Lapwing" (Longmans) is an account of a naval officer's jottings in China, Formosa, and Japan. It is a somewhat amusing book, but hardly anything more.

Under the general designation *Language* and its relations we find about the usual activity displayed. The first volume of "The Imperial Dictionary of the English Language, a Complete Encyclopædic Lexicon, Literary, Scientific, and Technological" (Blackie & Son), by John Ogilvie, LL. D., edited and enlarged by C. Annandale, M. A., appears somewhat late in the year. The remaining three volumes are promised in the course of 1882. So far as it has gone it is a work of real merit and value in English lexicography. Philology is much enriched by "An English-Arabic Lexicon" (C. Kegan Paul & Co.), by G. P. Badger, D. C. L. It is a work greatly superior to any previous attempt in this direction, and bids fair to remain a standard for many years to come. Professor Jowett's "Thucydides," translated into English, with introduction, marginal analysis, notes, and indices (Macmillan & Co.), is an admirable companion to his previous work, the translation of Plato, and will make the great Attic historian better understood and appreciated than heretofore. In the same class of works is F. H. Peters's "Nichomachean Ethics of Aristotle" (C. Kegan Paul & Co.); the translation as a whole is remarkably well executed. Max Müller's "Selected Essays on Language, Mythology, and Religion" (Longmans) are among the choicest of his previous published essays in the four volumes called "Chips from a German Workshop." The present volume is full of interest and instruction. The first volume of a "Dictionary of the Anonymous and Pseudonymous Literature of Great Britain," by two Scotch scholars, Messrs. Halkett and Laing (Edinburgh, Paterson),

makes its appearance at the close of the year. It extends from A to the end of E, and promises to be a very useful addition to works on this subject. Professor Dowden has made a more than ordinarily valuable contribution to the intelligent appreciation of the great dramatist, in his "Shakspeare, a Critical Study of his Mind and Art." It is a volume, though not large, of sterling merit.

As usual, *Science* attracts thought and attention to a large extent. Although no specially great work has been accomplished, yet there is no diminution of zeal and perseverance in devotion to its interests and advancement. Dr. James Geikie's "Prehistoric Europe, a Geological Sketch" (Stanford), is a carefully prepared work on the geological and other changes which Europe has undergone since the period treated of by the author in his "Great Ice Age." A "Text-Book of Systematic Mineralogy," by Hilary Bauerman (Longmans), is an admirable little volume on this subject, forming a practical guide to students.

In the "International Scientific Series" James Sully gives an interesting volume entitled "Illusions" (Paul, Trench & Co.). Its value to a scientific treatment of psychology is very considerable. H. Helmholtz's "Popular Lectures on Scientific Subjects" (Longmans), translated by Dr. Atkinson, contains some curious and useful matter. The American reprint (D. Appleton & Co.) has an introduction by Professor Tyndall. Joseph Parry's "Water, its Composition, Collection, and Distribution" (Warne & Co.), is, what it professes to be, "a practical hand-book for domestic and general uses." The author has brought together excellent data for considering and acting rightly upon this important topic. One of the most important works of the year is Henry Watts's "Dictionary of Chemistry and the Allied Branches of other Sciences" (Longmans). It originated in Dr. Ure's "Dictionary of Chemistry and Mineralogy," and is the outcome of nearly twenty years of labor to bring it to completion. In these five volumes and three supplements (equal, in fact, to nine volumes) there is furnished a complete history of the science down to the latest point of time. From the same publishers we have Dr. Ure's "Dictionary of Arts, Manufactures, and Mines," edited by Robert Hunt, a standard work on the important topics to which it is devoted (D. Appleton & Co., New York, keep this work in sets, 4 vols., illustrated with 2,550 wood-engravings, price \$40). Dr. J. Rosenthal's "General Physiology of Muscles and Nerves"; Adam Wurtz's "The Atomic Theory," translated from the French; and the new revised edition of Dr. Felix von Niemeyer's "Text-Book of Practical Medicine," translated from the German, are deserving of mention in this connection, as part of the scientific outcome of 1881. Louis Geiger, in his "Development of the Human Race" (Trübner & Co.), shows how to connect physiology and anthropology,

although the work as a whole can not be pronounced to be of any great weight. The second volume of Dr. F. M. Balfour's "Treatise on Comparative Embryology" (Macmillan & Co.) concludes a very laborious and learned work. The writer is a thorough Darwinian, and endeavors to bring all his facts into relation with the hypothesis of evolution and the survival of the fittest in the struggle for existence. Of lighter material, though not without real interest and value, is Elisée Reclus's "The History of a Mountain" (Sampson, Low & Co.), translated from the French. To this may be added J. A. Harvie-Brown's "History of the Squirrel in Great Britain" (Edinburgh, McFarlane), an interesting and useful work, relating mainly to the squirrel in Scotland. Charles Darwin's latest contribution to science, "Formation of Vegetable Mould through the Action of Worms," is noticed on a previous page, among reprints (D. Appleton & Co.).

Passing from science to *Poetry*, the latter is of small account in British literature in 1881. A. C. Swinburne's "Studies in Song" (Chatto & Windus) appeared early in the year. At its close, he published "Mary Stuart, a Tragedy." This poet, being a legitimate successor of Shelley, has a reputation of a lofty kind with a certain large body of readers. The present poem completes the trilogy (with "Chastelard" and "Bothwell") which the author began many years ago. It is dedicated to Victor Hugo, whom Swinburne calls his "beloved and revered master." D. G. Rossetti sends forth a volume entitled "Ballads and Sonnets" (Ellis & White) which is quite worthy of his well-deserved reputation. Miss C. G. Rossetti presents us with "A Pageant and other Poems" (Macmillan & Co.), which is a charming illustration of beautiful allegory and excellent skill in that difficult kind of poetry, the sonnet. Tennyson's "Ballads and other Poems," together with occasional short pieces in literary journals, are all that he has done for poetry in 1881. Browning and Morris have produced nothing of note this year. An interesting and well-executed volume is "English Odes," selected by E. W. Gosse (C. Kegan Paul & Co.). The selection includes, of course, magnificent odes from Spenser, Milton, Dryden, Coleridge, Wordsworth, Keats, etc. T. H. Ward's "The English Poets," with critical introductions, etc. (Macmillan & Co.), are noted on a previous page, in connection with American literature. They are admirably edited.

Works on *Art*, in its larger sense, are sufficiently numerous to show the general interest existing in this department of literary culture and enjoyment. A useful handy book, by M. B. Huish, is entitled "The Year's Art" (Macmillan & Co.); it contains a large amount of important and valuable matter for all concerned in English art and artists. The series, "Great Artists" (Sampson, Low & Co.), contains, in the last four volumes published, biographies, with illustrations, of Fra Angelico, Ve-

Iasquez, Gainsborough, Constable, and Sir D. Wilkie. The biographies are by different hands, and of diverse merit; but, as a whole, the series seems likely to be of permanent interest and value. Professor S. Colvin translates and edits Drs. Woltmann and Woermann's "History of Painting" (C. Kegan Paul & Co.). The first volume gives a comprehensive account of the early efforts of Christian painters and their forerunners in Egypt, Asia, Greece, and Rome. The second volume is to deal with their successors in the Renaissance. Messrs. Audsley and Bowes furnish a charming book on a subject just now of much popular interest; its title is "Keramic Art of Japan" (Sotheran & Co.). It is a very handsome volume, as well as a work of solid value. "Architecture, Gothic and Renaissance," by T. R. Smith (Sampson, Low & Co.), is one of a series of popular treatises on this subject. It is clear, simple, and excellently well done. The Rev. R. St. John Tyrwhitt's "Greek and Gothic Progress and Decay in the three Arts of Architecture, Sculpture, and Painting" (W. Smith), is a book of real merit, and may be consulted by students and general readers to advantage. The writer's ability, taste, and learning are abundantly evident throughout the volume. In regard to music, there is "A Dictionary of Music and Musicians," by eminent writers, English and foreign, edited by George Grove, D. C. L., vols. i and ii (Macmillan & Co.), to be completed in three volumes. This is rightly considered to be a work of great value and excellence. It is well digested, candid, and thorough in its treatment of the subject-matter in hand; and it combines instruction and amusement in a capital manner. Numerous art text-books and art hand-books are published, and valuable illustrated biographies of the great artists and the great musicians are the product of the year. "The Magazine of Art" (Cassell & Co.) and "The Art Journal" (Virtue & Co.) continue to appear at regular intervals. They are rightly regarded as exercising a wide-spread and beneficial influence in behalf of art. H. S. Edwards's "The Lyrical Drama, Essays on Subjects, Composers, and Executants of Modern Opera" (Allen & Co.), is a very readable work, and contains much useful and interesting information. "The Great Musicians" (Sampson, Low & Co.) is the title of a collection of biographies, from the German of Wagner, Weber, Schubert, Rossini and his school. They are carefully prepared, and well calculated to meet the popular demand for condensed rather than expanded lives of distinguished men and women. "Dictionary of Musical Terms," by Messrs. Stainer and Barrett (Novello & Co.), in its present abridged form, is very useful for students and others interested in music.

The sciences of *Law* and *Medicine* display about the usual activity this year. Most of the publications in the former relate rather to local and occasional matters, or to points in

which her Majesty's subjects are specially concerned. No work of great moment has appeared devoted to topics of larger or extra-national interests. Medicine, as in past years, has its earnest and able body of students and workers in behalf of suffering humanity. It is needless to attempt to enumerate here works in this department. A few are named on a previous page, under the general head of science.

In *Fiction* the product of the year 1881 is very large. Generally it is of a good, respectable quality, some of it very superior, though, at the same time, it must be admitted that a great deal of poor, even worthless matter, finds its way into print. The amount of production keeps pace with the demand, and the appetite of readers for this kind of gratification seems to increase from year to year. The older writers share, to a greater or less extent, in this fondness of the public for fictitious and exciting literature. New editions of Scott, Miss Austen, Bulwer, Marryat, Thackeray, Dickens, etc., are called for; but it hardly admits of doubt that the crowd of new aspirants for honors and success in this field will be disappointed in any expectation of taking the place held by authors belonging to former generations. The conservative character of British ways of doing things manifests itself in the clinging to the fashion of publishing novels in three volumes, at corresponding cost; but there is evidence to show that the demand for cheap issues is making itself heard and felt. Probably it will not be long before the practice, now so common in America, of cheap republication of all kinds of books will come into vogue in England. The re-issue of Lady Brassey's "Voyage in the Sunbeam" (Longmans), at the marvelously low price of sixpence, is significant in this connection; also, "The Ingoldsby Legends" at the same price, illustrated (Bentley & Son). "The Autobiography of Mark Ruthenford, Dissenting Minister" (Trübner & Co.), is powerfully written, but rather sad and gloomy in its tone. It undertakes to discuss several of the deep and perplexing questions of human life and destiny, and delineates the struggles of a soul attacked by unbelief and despair, or, as the writer phrases it, "perplexed by many problems I have never solved, disturbed by many difficulties I have never surmounted, and blotted by ignoble conceptions which are a constant regret." Anthony Trollope, in his "Dr. Wortle's School" (Chapman & Hall), and "Ayala's Angel" (same publishers), maintains his reputation for story-telling. The books named are amusing, ingenious, moderately exciting, and not deficient in skill and ability. "The New Virginians" (Blackwood) is of trifling merit as a novel; its main purpose seems to be to give vent to the writer's dislike of the North compared to the South of our country. Miss E. F. Poynter's "Among the Hills" (Hurst & Blackett) is a fair specimen of the every-day novel: it is worth reading, if one has nothing better to do,

which is about all that need be said. "A Romance of the Nineteenth Century," by W. H. Mullock (Chatto & Windus), deserves censure at the hands of all decent, cleanly-minded persons. It is a book which abounds with a peculiarly unpleasant mixture of devoutness and the world and the flesh and the devil. In contrast with books like this stands Miss Jean Ingelow's "Don John," a capital story, well told, and healthful in its tone and spirit. Miss Jessie Fothergill contributes two new books to the hundreds of novels of the year, "Made or Marred?" and "One of Three" (Bentley & Son). Though not equal, perhaps, to her first venture in authorship, they are well worth reading, and sound in manners and moral teaching. To these may be added "Kith and Kin," by the same writer, published toward the close of the year. "The Comet of a Season," by Justin McCarthy (Chatto & Windus), is a pleasant, clever story. It may not increase his reputation, but it certainly does him no discredit. Thomas Hardy's "Laodicean" (Sampson, Low & Co.) is after the author's usual type, interesting enough as a story, and evincing considerable power in depicting and analyzing character. Mrs. J. H. Riddell's "The Senior Partner" (Bentley & Son) is a book of more than average merit, considering the usual quality of the novels of the year. "Sunrise" and "The Beautiful Wretch, and other Stories" (Macmillan & Co.), are William Black's contributions to fiction during 1881. It is only necessary to say that the writer sustains himself well in both these novels, although, on the whole, the latter is superior to the former in strength of purpose and development of character. W. Besant and J. Rice (who are pretty well known as writing together) are authors of "The Chaplain of the Fleet" (Chatto & Windus). It is a remarkably well-put-together book, and tells a curious story of manners and customs of the eighteenth century. It is one of the best novels of the year.

Juveniles, as usual, especially at the holiday season, are numerous, and many of them very excellent. The Society for Promoting Christian Knowledge sends out its regular quota, and publishing houses are active in supplying the demand for good as well as elegant books for the young people. In tone and spirit most of the juveniles of the year are deserving of high praise.

LITERATURE, CONTINENTAL, IN 1881.
BELGIUM.—No branch of study is so much cultivated in Belgium as national history. The last numbers of the "Bibliotheca Belgica" contain studies on two Flemish juriconsults, Philippe Wielant (sixteenth century) and Josse de Damhoudere (seventeenth century); on the Jesuit historian Strada; and on the apostle of toleration in the Low Countries of the sixteenth century, Coornhert of Amsterdam. M. Edmond Vanderstraeten has at length published the second volume of his "Histoire du Théâtre Villageois en Flandre," a history of the intel-

lect, literature, and art of the Flemish rural classes. "La Belgique Illustrée" is continued, notwithstanding the death of Professor Eug. van Bommel, the editor. Hainault and the provinces of Namur and Liège have appeared this year.

M. Decamps has published an interesting work on "L'Industrie Houillère dans le Bassin de Mons" (Hainault); MM. Bruneel and Braun a technical account of the nautical arrangements, old and new, of the town of Ghent. The late Danish doctor Estrup has left a work on the memoirs of the Pope's legate Onufrius. A "Catalogue du Musée Plantin," at Antwerp, has been compiled by M. Max Rooses, the curator. Concerning the present time, the second and third volumes of the documents relative to the cessation of all diplomatic intercourse between Belgium and the Vatican have been issued.

Colonel Cruylants has published some interesting "Souvenirs d'un Volontaire de 1830." Hendrik Conscience has published an Academical lecture on the history and tendencies of Flemish literature; and his colleague in the Academy, Louis Hymans, traced the literary movement since 1830. In "Cinquante Ans de Liberté" Ch. and E. Lagrange and Gilkinet have written a history of science in Belgium during the last fifty years.

Félix Plateau has published a "Traité de Zoologie," and Mourlon a "Géologie de la Belgique." General Brialmont has printed two volumes on the "Tactique de Combat des Trois Armes." J. C. Houzeau and Lancaster have undertaken a "Bibliographie Générale de l'Astronomie." "Les Accidents," by Dr. C. A. Fredericq, is a popular treatise.

Adolphe de Ceuleneer has commented on a military edict of Trajan recently discovered in the bed of the Meuse. In "Le Berceau des Aryas" the Jesuit father Vander Gheyn has written a chapter on historical geography, founded on the comparison of languages. Henri Pirenne has a dissertation on a singular writer of the middle ages, Sedulius Scotus.

Since the King of the Belgians placed himself at the head of the European exploration of Central Africa, attention has been turned toward geography. To the "Recueil Consulaire" the Belgian consuls contribute papers of value; the report of the consul in Venezuela, M. Ern. van Bruyssel, is a complete dissertation on that republic, its trade and its sea-ports. Count Goblet d'Alviella and Émile Leclercq have written a monograph on the Canary Isles; Octave Maus, on Malta, Constantinople, and the Southern Crimea; Albert Verhaegen, on Brazil; Alfred Bruneel, on Damascus, Jerusalem, and Suez; Albert Dubois, on Spain, Gibraltar, and the coast of Morocco; Ernest Gilon, a work on Uncivilized Races; and M. Édouard de Laveleye, one on the present condition of the United States.

In the domain of political and moral sciences, besides numerous essays on the proportional

representation of minorities in elections, a question which preoccupies public opinion, there are sundry works of importance. M. Périn, ex-Professor of the University of Louvain, who was the leader of the Ultramontanes, has published a remarkable book on the "Doctrines Économiques depuis un Siècle." Hector Denis, professor at Brussels, has studied the question of the income-tax. Professor Victor Brants, of the Catholic University of Louvain, has compiled an interesting account of "L'Économie Sociale au Moyen Âge." Dr. César de Paepe has published a French translation of a pamphlet of Lassalle's, and has added to it an essay on the German socialist. Louis Borguet has a translation of Minghetti's "Lo Stato e la Chiesa," with an introduction by M. Émile de Laveleye; there is a volume by the latter author on "Le Socialisme Contemporain," and four essays on "La Question Monétaire en 1881."

Three philosophical works have especially attracted notice during the past year: "De la Connaissance de Soi-même," an essay on analytic psychology by Professor Charles Loomans; "La Liberté et ses Effets Mécaniques," by J. Delboeuf; and "L'Essai sur la Morale Stoïcienne," by Professor Em. Hannot.

Jurisprudence has furnished a contingent of remarkable works. Professor F. Laurent has published several volumes of his work on "Le Droit Civil International." Ernest Nys has written on "La Guerre Maritime." Edmond Picard has excited violent clamors by his pamphlet, "La Confection Viciieuse des Lois en Belgique," a satire on the legislation of the Belgian Chambers.

The history of fine arts occupies an honorable position. F. A. Gevaert, who has published the second volume of his "Histoire de la Musique dans l'Antiquité," has studied the rhythm, metre, chords, and general structure of antique compositions, instruments, lyrical monody, instrumental soli, choral dances, music in the Greek drama, and finally the decadence of musical art among the ancients. Alphonse Wauters has written a monograph on Bernard van Orley. Max Rooses has supplied curious details concerning the engravers of the Rubens school in "Les Frères Wienicx à l'Imprimerie Plantinienne." Canon de Haerne has published a "Coup d'Œil Historique sur l'Art Espagnol en rapport avec l'Art Flamand." Vanden Brande's "Geschiedenis der Antwerpse Schilderschool," a masterpiece of historical accuracy; "Un Congrès de Peintres à Bruges en 1468," by M. Alexander Pinchart; "L'Art et la Liberté," by Lucien Solvay, and "Les Caractères de l'École Française Moderne de Peinture," by Émile Leclercq, treat of the present epoch.

Two original volumes of poetry have appeared, "La Mer Éléante," by M. Georges Rodenbach; and Théodore Hannon's "Rimes de Joie." A materialistic and eccentric style mars the poetic effect of the latter.

There is a whole series of novels and novellettes.

In literary criticism Frédéric Faber has written on Jean François de Bastide, a French libel of the past century; and G. Eeckhoud has published a volume of details on Hendrik Conscience.

The most original works produced in Belgium are written in Flemish. New works of Flemish poetry are by J. de Geyter, Hansen, Amandus de Vos, Guido Gezelle, Pol de Mont, the late Alfred Wenstenraed, Staes, Rens, and others. J. Vuylsteke has printed in a single volume his "Verzamelde Gedichten."

Besides works of fiction by Van Cuyck, Janssens, Van Haesendonck, and Jan Bouchery, Geiregat's "Vergeet-mij-nietjes" and "Alde-nardiana" by MM. Teirlinck-Styns are noteworthy. The new Amandus de Vos's novel, "Een Vlaamsche Jongen," which appeared under the pen-name of "Wazenaar," produces the effect of a new book, so conscientiously has the author revised his work.

BOHEMIA.—The activity that marks the beginning of a new era for Bohemian literature has in 1881 mainly found expression in the magazines. Jaroslav Vrchlický has two more volumes of original verse, "Nové Epické Básne" and "Pouti k Eldorado" ("On the Pilgrimage to Eldorado"). A long narrative poem, "Twardowsky," from the same pen, appeared in the periodical "Lumír." Svatopluk Cech and Julius Zeyer are both poets and romancers. Cech contributed minor poems and sketches to his magazine, the "Květy." Zeyer wrote a novel, "Žrada v Dome Han" ("The Treason in the House of Han"), on a Chinese theme as a continuation of a series, "The Tales of Shoshana." A young poet, Karel Leger, issued two volumes of verse, "Básne" ("Poems") and "Zapomenuté Sny" ("Forgotten Dreams"), including echoes of the Russian national ballads and lyrics. In a narrative poem by Otokar Cervinka, "Ales Romanov," the hero is a young enthusiast of 1848. Adolf Heyduk, the Burns of Bohemia, wrote "Dudák" ("The Bagpiper"). Irma Geislova's "Divoké Koreni" ("Wild Weeds") contains lively and original fancies.

The drama, the weakest part of Bohemian literature, seems to be improving. The opening of the new national theatre at Prague stimulated writers, nor were they checked by the burning down of the grand edifice almost immediately after its completion. A new fund of a million florins was raised by public subscription in less than a month, and the theatre will soon rise from its ashes. The historical drama suffers from the police restrictions, no historical personage nor theme, however distant in time, being allowed to figure on the stage if connected with the national political and religious struggles. "Harant's Wife," from the chronicles of the "Thirty Years' War," by E. Krásnohorská, a lady, was one of the notable plays of the year, as was also Durdík's

philosophical drama, "Stanislav a Ludmila," founded on the Hussite movement.

Sofia Podlipska has an historical romance, "Jaroslav ze Sternberka," and the first part of a social novel, "Peregrinus." Alois Jirásek published "Na Dvore Vévodském" ("In the Duke's Court"), and V. Benes is the author of a series of popular fictions under the titles "Cestou Krizovou" ("By the Passion Road"), "Stadicky' Král" ("The King of Staditz"), and "Letopisy Sázavské" ("The Chronicles of Sázava").

FRANCE.—At the present day the rate of production of the publishers exceeds in Paris alone two hundred books and pamphlets per week.

Lecoy de la Marche has published a life of St. Martin. A manual of the history of religions has been translated by Maurice Verne from the Dutch of C. P. Tiele. A new commentary on the Bible is by Édouard Reuss. Marius Fontane has undertaken a universal history, and gives as a first installment "L'Inde Védique," presenting a picture of social life and of the early development of the ancient Indian civilization; the second volume will be entitled "Les Iraniens." Of the "Écrits Inédits de Saint Simon," annotated and edited by M. Faugère, two volumes have appeared. Lieutenant-Colonel Jung's "Bonaparte et son Temps" has been eagerly read. The "Mémoires de M. Claude," who was chief officer of the *Police de Sûreté*, is a sensational book; these memoirs have been disowned.

Among the noteworthy historical publications of the year are the "Maréchal de Villars et son Temps," by Ch. Giraud; a book on Charlemagne by Lucien Double; a book entitled "Histoire du Tribunal Révolutionnaire de Paris avec le Journal de ses Actes," by H. Wallon; Ch. Hippeau's "Instruction Publique pendant la Révolution"; Augustin Marrast's "Vie Byzantine au VI^e Siècle," and a popular illustrated history of France, written from a democratic point of view. Chantelauze, who edited Commines, has published a monograph on the amours of Louis XIV and Marie de Mancini; and Jules Lair a monograph on Louise de La Vallière. A "History of the French Language," traced from its birth and development down to the end of the sixteenth century, is by A. Loiseau. The Marquis de Nadaillac's "Les Premiers Hommes et les Temps Préhistoriques" is a work on the antiquity of the human race. Félix Puaux writes on "Les Précurseurs Français de la Tolérance au XVII^e Siècle." Noteworthy works of military history are Bourelly's "Life of Marshal Faber," and Staff-Captain L. Vial's "Histoire Abrégée des Campagnes Modernes jusqu'en 1880."

It is only ten years since the science of geography began in France to be considered of much moment. Jules Verne's story-books have helped not a little to stimulate the study of this science. Most of the publishers have undertaken the publication of "Bibliothèques de

Voyages," the most successful of which are the "Journal des Voyages" and of Édouard Charton's "Tour du Monde." The "Nouvelle Géographie Universelle," by Élisée Reclus, is the work of a great geographer. Simonin's "Ports de la Grande Bretagne" is popular. Paul Soleillet's travels in the Sahara and Soudan, and "L'Europe Illustrée," appear in parts. Rochefort's "Voyage de Nouméa en Europe" was much read. The expedition to Tunis brought forth books on the regency of Tunis, on Algeria, and on the colonies, in great numbers.

The "Discours et Plaidoyers de Gambetta" will contain all the addresses of the great advocate as well as all his parliamentary speeches. The "Leçons, Discours, et Conférences" of Paul Bert, Minister of Public Instruction, contain physiological lectures on the vital principle. "L'Œuvre de Claude Bernard" is a thick volume, furnished with an introduction by Mathias Duval, and notes by E. Renan, P. Bert, and Armand Moreau.

In addition to continual reprints of the works of Auguste Comte, there has just been published a summary of the "Positive Philosophy," by Jules Rig. Alexis Bertrand's "L'Aperception du Corps Humain par la Conscience" is a book which has provoked warm controversy. Fouillée's "Science Sociale" is an able work. "L'Histoire de la Philosophie Scolastique," by M. Haureau, gives an account of the later exponents of mediæval scholasticism. Octave Noël's "Étude sur l'Organisation Française de la France" traces in the past the originals of the modern French administrative system. Y. Guyot has written "Doctrines Sociales du Christianisme," an exposition of the social principles of Christianity, their application, and the influence at present exercised by Christianity on humanity. There is an essay on the distribution of wealth by Paul Leroy Beaulieu. Adam Smith's "Wealth of Nations" has been translated by Germain Garnier. Alexandre Beljame has written an essay on English men of letters and their readers in the seventeenth century.

New works in philology are, a book on French etymology, by Hippolyte Cocheris, and Profillet de Mussy's "Nouveau Cours Pratique de la Langue Française." F. Godefroy's colossal enterprise, the "Grand Dictionnaire de l'Ancienne Langue Française et de tous ses Dialectes du IX^e au XV^e Siècle," is still progressing. Interesting works of the same class are the "Dictionnaire des Lieux Communs," and the "Dictionnaire d'Argot," by Lucien Rigaud.

Of the naturalistic school of fiction, the master, Zola, had not published his new novel before the end of the year, and only appeared as a critic and controversialist. J. K. Huysmans, one of his disciples, published "En Ménage," and another, Henri Céard, makes his first essay with "Une Belle Journée." The posthumous work of Gustave Flaubert, "Bouvard

et Pécuchet," appeared at the beginning of the year.

One of the most notable works of the year as a popular success has been the "Numa Roumestan" of Alphonse Daudet. Jules Claretie's "Amours d'un Interne" initiates his reader into the sorrows and mysteries of Parisian hospitals, and describes their machinery in a realistic style; while in "Monsieur le Ministre," his last work, the author has succeeded, in fixing an image of the new parliamentary manners. The "Histoire d'une Parisienne" of Octave Feuillet is sober as regards details, and easy in style. The author of "M. de Camors" has written a novel free from his usual eccentricity. Ferdinand Fabre, in "Mon Oncle Célestin," approves himself an observer and a brilliant writer. The "Noirs et Rouges" of M. Oherbuliez, the newly elected member of the Académie, is an irritating political novel, but elaborated with care. Madame Henri Greville's "Le Moulin Frappier" and "Perdue," are romantic and passionate tales.

In "Le Bachelier," Jules Vallès has given in a very excellent if mutinous style the second part of his confessions, which are finished in a third volume, "L'Insurgé." In "Le Roi Vierge" Catulle Mendès has painted the court of the capricious King of Bavaria. "Le Père de Martial" of Albert Delpit is one of the better works of the year; as are also "Pompon," by Hector Malot, and "Cezette," a story of country manners in the south, by Arthur Pouillon. A striking analysis of vice is "La Glu," by Richepin.

"Les Quatre Vents de l'Esprit" of Victor Hugo is the most beautiful volume of poems that has appeared since the first series of "Légendes des Siècles." "Les Poésies Inédites de Lamartine," which has just appeared, contains some exquisite pieces. Paul Déroulède, in "Marches et Sonneries," is inspired by the patriotic braggadocio of his nation. A revised edition of "La Chanson des Gueux" of Jean Richepin has appeared.

Of the plays of the year, "Madame de Main-tenon," a pretty piece in verse by François Coppée, had only a *succès d'estime*. The "Princesse de Bagdad," by Alexandre Dumas, was almost a failure. "Le Monde où l'on s'ennuie" of Édouard Pailleron was the greatest success of the year. "Odetta," by Victorien Sardou, is a captivating play. The dramatized versions of "L'Assommoir" and "Nana" have been printed. Zola has besides published a critical *brochure* styled "Nos Auteurs Dramatiques," in which he passes sentence on his brethren.

The dramatic works of Ohlenschläger and Holberg, the Corneille and Molière of Denmark, have been translated by Xavier Marmier. "Le Théâtre en Angleterre" embraces the history of the English stage down to the immediate precursors of Shakespeare, by J. Jusserand.

Works connected with the fine arts are the "Benvenuto Cellini" of M. Quantin; "La Re-

naissance en France," a colossal work by Léon Palustre; the "Van Dyck" of Jules Guiffrey; "L'Art à travers les Mœurs," by Henri Havard; the "Albert Dürer et ses Dessins" of Charles Ephrussi; the "Arts du Métal," by Giraud; "Millet," by M. Sensier; "Les Monuments de l'Art Antique," by Olivier Rayet; and the new work of Paul Lacroix, "Le XVII^e Siècle, Science et Arts."

GERMANY.—More books are written in Germany than in any other country, but fewer bought. In no other part of Europe is the number of family libraries proportionately so small; that of lending libraries, of which the rich and the well-to-do avail themselves without expense, so large. In consequence of this state of things the profits of a German writer are small, though books are dear. Of late efforts have been made to rescue authors, publishers, and the public from this imbroglio. Only since the house of Cotta lost "protecting privileges" have the German classics really begun to be the possession of the people, and enter the home of the tradesman and the cottage of the peasant. Along with the cheap editions, which unfortunately include only the works of past generations, there have appeared of late collections of single works of the best writers, which in part comprise the productions of living authors. The "Haus- und Familien-Bibliothek," published by Spemann, consisting of nicely printed volumes at a mark each, after the fashion of the French one-franc libraries, has had a great success. Enterprises like this, and like the collection of novelettes edited by Paul Heyse and Hermann Kurz—which has been discontinued—spare the ordinary reader the task of selection and the disappointments attending it.

Proportionately as the political ferment increases in Germany, the literary and scientific settles down.

Victor von Scheffel heads the numerous band of German convivial poets. One of the merriest is Rudolf Baumbach, the author of "Zlatorog" and "Frau Holde," who has published a volume of "Spielmannsliedern." Richard Volkmann, a noted physiologist and the author of the fairy tales "Plaudereien an Französischen Kaminen," has published "Burschenlieder"; and another Halle professor, Ernst Zitelmann, also has published a volume of light poems.

The more dramatic prizes there are, the fewer plays there are that deserve them. The jury at Vienna has once more found no piece produced within the three years worthy of the Grillparzer prize. The conditions stipulated by Grillparzer include the Draconian rule that not only must the prize-work give promise of lasting success on the stage, but also possess literary merit. The first part of the rule was directed against the increasing number of closet dramas; the second against the degradation of the play into a spectacle. The jury debated whether they dared award the prize to the

"Hexe" of Arthur Fittger, or the tragedy "King Eric," by Joseph Weilen. "Clytemnestra," a tragedy by G. Siegert, written ten years ago, has only been acted this year. The object of the writer has been to reconcile the ancient theme to the modern conscience; and for this reason he has abandoned the notion of the destiny awaiting the heroine, and discarded the matricide of Orestes as repugnant to human feelings. While the writer of this play has converted a noble tragedy into a family drama, the more gifted author of "Die Patricierin," Richard Voss, has turned the historical struggle between tyrannical masters and avenging slaves into a tragical love-duet between the proud spouse of the triumvir Crassus and the gladiator Spartacus. This drama is full of color and energy; and, although its construction betrays the hand of a beginner, it gives a far truer picture of the Roman world than the tragedy mentioned above does of the antique spirit. A third tragedy, "The Carolingians," by E. von Wildenbruch, depicts the contest between the pious son of Charlemagne and his impious grandsons Lothaire and Louis. The author has taken great liberties with facts. In "Harold" the same writer treats the subject of Tennyson's tragedy of that name, but the development of motives is less studied than multiplicity of incidents. A subject well fitted for comedy has been used by Paul Heyse in his "Weiber von Schorndorf." In handling this amusing historical incident, the writer has depicted the contest between man and wife, in which the former represents the shrewd but anxious brain, the latter the vehement but generous heart. II. Kruse deals in his tragedy "Raven Barnekow" with a theme belonging to the Fatherland, the contest between the arbitrary but loyal bailiff and the burghers panting after freedom. German comedy has found a second Kotzebue in G. von Moser. None of his older works, nor the comedy which he has brought out this year in conjunction with Schönthan, "War in Peace," equal the vigorous caricature of "Deutsche Kleinstädter," or such a genteel comedy as the genial "Beide Klingsberg." A specific German type of dramaturgy is the village play. Since Charlotte Birch-Pfeiffer dramatized Auerbach's "Dorfgeschichten," and Mosenthal's "Deborah" brought the subject of Jewish emancipation on the boards, village life has been made fashionable by L. Anzengruber. This year a daughter of Madame Birch-Pfeiffer, Wilhelmine von Hillern, has made a successful attempt in the latter direction and surpassed her mother. "Die Geierwally" is an ably condensed dramatic version of her village tale of the same name.

The fresh, roguish, hearty tone which suits the fairy tale has not been so happily caught, since the days of Jacob Grimm, as in the "Sommermärchen" of Rudolf Baumbach. In these stories the old German mythology, which like the Greek peopled hill and wood and spring

with guones and elfs, wakes to life figures full of spirit in the glades of the Thuringian Forest.

Among the few original novels of the year the first place is due to Conrad Ferdinand Meyer's tales of "Georg Jenatsch," "The Saint," a pilgrim's tale, and "Das Brigittchen von Trogen." Paul Heyse has printed in the magazines a story of the troubadours of Provence, notable for subtilty and coloring, called "The Lame Angel," and under the title of "The Ass," a humorous picture of pessimistic philosophy in the ruinous huts of poverty. Louise von François, in her humorous story, "Phosphorus Hollunder," has furnished a description of a refined character confined in a small town, after the manner of Jean Paul. Marie von Ebner-Eschenbach, in her "Newly Collected Tales," has supplied characteristic pictures from the stratum bordering between art and handicraft. Rosegger, her fellow-countryman, whose collected works have been published this year, gives graphic descriptions of life among the Austrian Alps. A third Austrian writer, Leopold Kompert, known from his novelettes, "From the Ghetto," as an able delineator of the Jewish popular spirit, has in his "Heini and Franzl" presented a psychological and exciting story of school life. The hero in the last volume of Freytag's "Ahnenn" (the descendant of Ingo, King of the Vandals) condescended to settle down, as a Dr. König, in the humble position of editor of a small weekly paper in a Silesian village. The solution of the historical problem, which had been anxiously awaited for eight years, and followed through six volumes, seems to be that Europe, according to the dictum of Gervinus, is ripening for republics. While Freytag has thus descended to every-day life, Felix Dahn, the historian of the Western Goths and the glorifier of the Ostrogoths, has ascended in "Sind Götter?" to the gods of the Walhalla, where the father of the gods, Odin, finds comfort in a pantheistic-pessimistic view of life, which he seems to have learned from Schopenhauer. Georg Ebers is the Alma-Tadema of novelists; his last novel, "The Emperor," carries the reader back to the days of the Egyptian Renaissance under Hadrian. The learned author has this time not been content with exhibiting his stupendous knowledge of the detail of archæology, but, as in his best work, "Homo Sum," has devoted his strength mainly to delineating the contradictory character of his chief figure, which is a marvelous mixture of brilliant and dangerous qualities.

A most interesting epistolary collection, and one not merely historical, but full of human interest, is that of the letters of Maria Theresa to her children and friends published by the historian Alfred von Arneth. Another set of letters, those of a brother of the great Swiss historian Johannes Müller from "Herder's House in Weimar," written toward the dawn of the golden age of German literature, are a

genuine specimen of the sentimental eccentricity and fantastic enthusiasm of the day. The accounts of the travels of another student are an illustration of the cosmopolitan sentiments and revolutionary enthusiasm for the young French republic that prevailed among the contemporaries of the First Consul. The author, Carl Hase, was a Jena philologist, who imagined that Greek liberty was about to reappear in France. He wandered on foot to Paris with twenty thalers and his Homer in his pocket. There the young Grecian, owing to his knowledge of languages, finding friends among the most distinguished scholars, obtained a post in the National Library, and was afterward tutor to the subsequent Emperor Napoleon III. Hermann Rollett's splendid collection of the authentic portraits of Goethe is accompanied by full and critical remarks by the editor. The portraits are not unfrequently very different from the usual conception of the poet. This year's number of the Goethe annual, edited by Ludwig Geiger, contains among other contributions an interesting article on Goethe's relations to Denmark, from the pen of the eminent literary historian Georg Brandes.

The last volume of Vischer's critical essays, "Altes und Neues," contains a vindication of his disputed opinion about the second part of Goethe's "Faust." The same writer also contributes a critical study on the Swiss novelist Gottfried Keller, whose strange romance entitled "Green Henry," after the manner of "Wilhelm Meister," has this year re-appeared remodeled and with an entirely different ending. In Buchner's "Life of Freiligrath," in letters, we are presented with a view of the real life of a man whose poetic flame showed itself early, and, in spite of all outward hindrances, burst forth on the volcanic soil of his native Rhineland.

Leopold von Ranke has begun an extensive work on universal history. While this work gives history in a cosmopolitan form, others, such as Arnold's "Early Teutonic Period" and Dahn's "Teutonic Peoples and Tribes," present history in a national form; others, again, such as L. von Gonzenbach's "Life of Hans Ludwig von Erlach," present it in a local shape. Arnold has set himself the task of bringing Tacitus's account of the Germans again into repute in opposition to Cæsar's derogatory reports. Dahn is acknowledged one of the best authorities on the Teutonic tribes.

The travels of Baron von Hübnér, late Austrian statesman and ambassador, which were first published in French, have appeared as a German original. Ludwig Steub's pleasant pictures "From Tyrol" and Martin Schleich's "April Days in Italy" are interesting descriptions of European scenes.

An artist's work on Leonardo da Vinci has recently appeared, by the painter Ludwig, in Rome. Among the works relating to music the most noteworthy are E. Hanslick's "Musikalische Stationen," a series of new critical es-

says, and a collection of unpublished "Mozartiana," by Gustav Nottebohm.

Among the political works Franz von Löher's "Russland's Werben und Wollen" occupies a prominent place. Conspicuous also are the somewhat dogmatic "Essays" of Ed. Lasker, the leader of the National Liberal party; noteworthy also is the series of speeches of the Chancellor (1871-'79).

German philosophy again stands, as it did a hundred years ago, under the influence of Kant. Kant hoped to establish human knowledge on a new and indestructible foundation by giving proofs of the unalterable *a priori* elements in man's capability of knowledge. This discovery was first made public by him in his inaugural address in 1770, and the proofs were given in his three principal works, "The Critique of Pure Reason," "The Critique of Practical Knowledge," and "The Critique of the Power of Judgment." The first of these, which is the starting-point for all modern German philosophy, as Locke's essay is that of all modern English philosophy, appeared in 1781. It has become necessary to form a special system of Kantian philosophy, and it is also necessary to have special commentaries on Kant on account of the obscurities and contradictions that originally existed in the work or have gradually crept into it. Hans Vaihinger, a pupil of the late Albert Lange, the founder of the Neokantian school, has come forward to meet this want with an able and exhaustive commentary on Kant's "Critique of Pure Reason," in which he compares the text of the manuscript version with all the other editions, and offers, in continued succession, an explanation and comparison of these together with the main substance of all Kant's other works. Another admirer of the Königsberg sage, Karl Kehrbach, has reprinted another work of Kant's, "Toward Everlasting Peace"; it is a small work, but one which, considering the dangers impending, is doubly important at present. It appeared first in 1795, amid the hue and cry of the war of the Revolution. Kant's sermon on peace, in which he expresses the hope to see the disputes of nations settled by a supreme international law court, was unfavorably received by his contemporaries, who thought it contained "too glaring an amount of democratic sentiment." Of the other philosophical writings of the year, some follow the path struck by Kant, such as Otto Kaspary's treatise "On the Certainty of Knowledge," and Robert Zimmermann's "Outlines of Anthroposophy"; the latter offers the first encyclopedic conclusion of Herbart's realism. Other works, such as "The Visible and Invisible World," by the spiritualist Perty, and "On the Prejudices of Mankind," by another spiritualist, Hellenbach, who, in spite of an otherwise unprejudiced mind, seems prejudiced in favor of mediums and spirit-rapping, are a proof that Kant has not proved sufficient to enlighten all.

GREECE.—The first collected edition of the

poet Achilles Parasechos fills three volumes, and represents the activity of twenty years. In days when the realistic school is beginning to gain ground in Greece he has remained true to the romantic school. He is the most considerable Greek lyric poet of the day. The wit of the *Éllores* of Demetrius Kokkos is pure Attic. Georgios Suris shows talent in his comic verses. Georgios Drosinis is a young and promising poet. In his collection of lyrics, "Cobwebs," he wavers between the tenderness of Coppée and the humor of Heine. The Calderon medal offered by the Madrid Academy has been carried off from thirteen competitors by Const. Xenos.

The editing of unpublished sources of the history of mediæval Greece and of texts of popular literature is zealously pursued. Constantine Sathas has brought out in Paris the first two volumes of his "Monuments Grecs." Lambros has completed his edition of the hitherto inedited works of M. Akominatos, Bishop of Athens (1182-1220), and has published at Paris his "Collection de Romans Grecs," a collection of mediæval Greek poems. A. Miliarakis has printed the epopee on Basilios Digenis Aeritas. Gabriel Sophocles has brought out a verified work of the polymath Cæsarios Daponte. Gabriel Destunis has published at St. Petersburg the song of Armuris and a *threnos* on the capture of Athens by the Turks. He has also issued a popular poem of Trebizond, "Xanthinos." The late Professor Wagner's "Trois Poèmes Grecs du Moyen Age inédits" have been printed. A. Sigalas has published, under the title of "Collection of National Poetry," about 400 popular songs with the music. Interesting is the collection of Epirote songs made by the late Pan. Aravantinos.

In philology there are: A metrical translation in the popular language of the "Odyssey" by Jacob Polyas; the treatises by A. Tzerepis upon Greek compound words; upon the Areopagus, by K. Papamichalopoulos; on the "Festivals of the Ancient Greeks," by A. Maltos; "Critical Remarks on Strabo," and on "The Native City of Pæonius of Mende," by M. Dimitzas; and on "The Scientific Determination of Ancient Greek Plants by Aid of the Present Names," by S. Krinos. "A Short Account of Education among the Modern Greeks," by C. Xanthopoulos, is a useful book. Praise is due to the work published in Paris by G. Chasiotis, "L'Instruction Publique chez les Grecs depuis la Prise de Constantinople," in which the history of the formation of schools throughout Hellenic lands during the last four hundred years is related.

N. Philippidis has treated of an interesting chapter in the national history in his work on "The Uprising in Macedonia in 1821." The "Historical Studies" of M. Renieris treat of the accession of the Candiot Philip Filarges to the Papal throne as Alexander V, and of the position of the Byzantine Empire at the

Council of Bâle. A work written in German by S. Pappageorg, "Ueber den Aristeebrief," contains a collation of a codex hitherto unused. G. Derbos treats of "The Legendary Journey of St. Peter to Rome."

HOLLAND.—A young author, G. Jonckbloet, has given in "Vlindertjens" ("Butterflies") some charming poems. Mallinckrodt's patriotic poems and Lovendaal's love poems are written with warmth of feeling. A little volume of the poetry of Mrs. Hymans-Herveldt, who has died, has just been issued. Under the pseudonym of "Fiore della Neve" a poet has come before the public with "Liefde in het Zuiden" ("Love in the South"), narrating a love tragedy in verse of a very high order.

A prose translation of all the plays of Shakespeare has been completed this year by A. S. Kok.

An interesting book for the history of the Church is Pierson's "Studiën over Calvyn," by which he has highly incensed the admirers of Calvin.

The fact that Holland and Belgium have rejoiced in 1881 in the fiftieth anniversary of their separation has led many to write once more about the war of 1831, and the campaign of ten days. So Wupperman has written the "Geschiedenis van den Tiendaagschen Veldtocht"; Weitzel, "Herrinneringen van een oud-Vrywilliger" ("Memoirs of an ex-Volunteer"), and Captain de Bas, "Two Reviews in '31."

Partly to the history of the Church and partly to that of literature belongs the posthumous work of Professor Moll, "Geert Groete's Dietsche Vertalingen," edited by Professor Acquoy. The first part of a new edition of Huygens's works has appeared, which will be a worthy counterpart of Leendertz's edition of Hooft. Professor Moltzer published the fourth part of his "Studies and Sketches," the plays of Starter (seventeenth century), an Englishman by birth. Dr. Jan te Winkel has published an essay on Blasius. The third part of Dr. van Vloten's "Nederlandsch Kluchtspel" is finished. In the Dutch farces we see all the native humor and aversion to prudery. Galandat Huët is publishing some of the unprinted letters from and to Elizabeth Wolff. Beets has edited the poems of the accomplished Anna Vischer.

Busken Huët is writing in French a history of the civilization of the Dutch down to the seventeenth century.

The "Archives of Dutch History of Art," continued for many years by Obreen, contain interesting details of the clubs of painters and the Guild of St. Lucas. Johan Gram, in "Onze Schilders in Pulchri Studio," describes the lives of about eighty modern painters, with many anecdotes. A more serious book is Vosmaer's "Modern Painters"; the first essay, on Israëls, contains etchings, photographs, and portraits, and says more about the artist's work than about the artist.

A novelty in fiction is the ethnographical

novel. Mr. Perelaer, the author of "Borneo," has succeeded in making his book fascinating and instructive at the same time. "La Renzoni," by Melati van Java, is her best novel. Other works of fiction are Beekman's "Schetsen en Novellen," and Van Maurik's new volume. Van Bloemen Waanders gives his readers in his "Indische Schetsen" the benefit of his knowledge of Indian affairs. Reminiscences of India and impressions of Holland are to be found in Gideon's "Brieven aan de Neefjes in de Oost" ("Letters to my Nephews in the East Indies"). Werumens Buning has written another volume of tales, "Our Ancestors on the Ocean," in which the Dutch naval heroes are painted in a graphic and genial style. A novel by Marcellus Emants, "Jong Holland," takes a pessimistic view of his contemporaries. Pleasant books of fiction are two little novels of Ter Burch, "Sproken van Minne" ("Tales of Love").

HUNGARY.—Peace prevails in Southeastern Europe, and the effect is gradually becoming visible. Hungary has always exercised a strong intellectual influence upon the small Christian nationalities of the East. Professor Max Müller is to a certain extent right when he pleads for the use of a better known language. But one point which has been overlooked is that Hungarians before all keep an eye upon their own nation, and that knowledge can be only diffused among a people if clad in the national garb. This is especially the case with the Hungarians, who defend themselves against the formidable influence of Germany, and who strengthen their national individuality by using their vernacular for scientific purposes. Of literary productions which interest a wider circle the "Ungarische Revue," a periodical written in German, gives extracts from the papers read before the Academy, and papers upon Hungarian topics from the pens of eminent men.

Jókai has two novels, called "Those who Die Twice" and "Pater Peter" ("Friar Peter"), which prove the fertility of this gifted author. Among the novel-writers of the younger generation, Cornelius Ábrányi keeps the first place. In his "Old and New Gentry," the contrast between an impoverished country squire and a financial upstart is handled. Next stands Colomannus Mikszath, whose fiction, "Our Slavonian Countrymen," is a faithful picture of life in Upper Hungary. Not less interesting is Gustav Beksics's "The Country of Liberty," a description of England in the form of a novel. Hungarian fiction suffers from the competition of foreign countries.

Next to the novel, lyric poetry is most in fashion. Aladár Madách and Ludovic Bartók have come forward with a collection of their scattered verses. Of the older writers, John Vajda is a poet of talent and narrative power; Paul Gyulai is, after Arany, the most eminent Hungarian poet, of great finish and elegance; and A. Greguss is a tasteful versifier of fables.

In dramatic literature Gregor Csiky earned the laurels of the year with his "Czifra Nyomorúság" ("Splendid Misery").

In philology the Academy has published "Linguistic Monuments." Count G. Kuun's edition of the "Petrarca Codex" is placed before the scientific world in a Latin translation. Turcologists will be thankful for his edition of the Cumanian glossary, which dates from 1303. Professor J. Budenz has finished at last his "Magyar-ugor összehasonlító Szótár" ("Magyar-Ugrian Comparative Dictionary"), and students of the Ugrian branch of the Ural-Altaic languages will now have ample opportunity to get acquainted with the degree of affinity existing between the Finnish, Estonian, and other tongues, and the Magyar. Adopting the theory, by no means proved, of the predominantly Finn-Ugrian character of the Magyar tongue, valuable portions of his work are defaced by arbitrary etymologies. In "Az Iszlám," by Dr. J. Goldziher, Islamism is shown in its real character as the religion of the inhabitants of the desert, with its traditions, its hagiology, its influence upon the old architectural monuments, and the European prejudices against it. "The Great Epic Poems of the World," by Charles Szász, contains extracts from the great epics of the Indians, Persians, and Greeks. A contribution to the history of education in Hungary is "Our Public Instruction in the Eighteenth Century," by the late Aladár Molnár. To educational literature belongs also M. Ludvic Felméri's "The Present State of Public Instruction in England."

"The Speeches of Francis Deák from 1829 to 1847," edited by E. Konyi, was warmly received by the public.

Connected with the politics of the last decades is Mr. Francis Pulszky's concluding volume of his memoirs. It contains the impressions of a former political refugee in London and in New York. Of an outspoken character are the essays and speeches of Augustus Trefort, at present Minister of Public Instruction in Hungary.

Sigismundus Ormos's "The History of Hungarian Civilization during the Period of the Arpadians" is the first part of a large work on the history of civilization in Hungary, and from which we learn that Hungary during the middle ages was not entirely dependent on German civilization, but owed a good deal to Italy and Byzantium.

ITALY.—Notwithstanding the great number of theatres, and the proverbial proficiency of third-rate actors and actresses in Italy, the number of new plays acted is small in comparison with the number written. Out of one hundred and one plays presented at the competition instituted by the jury of the National Drama of Milan, not one was considered worthy of the stage. Public opinion remains faithful to its favorite authors. The loss of Pietro Cossa, the Roman dramatist, and of Tommaso Gherardi del Testa, of Pistoia, was very deeply felt, but

there are still about ten distinguished writers who contend for public favor: Cavallotti and Castelnovo, of Milan; Ludovico Muratori, of Rome; Achille Torelli, of Naples; Giacinto Gallina, of Venice; Bettoli, of Parma; Giuseppe Giacosa, Vittorio Bersezio, Leopoldo Marengo, and Valentino Carrera, of Turin. The last-named has had great success at Turin with a play in two acts, the subject of which is the last days of Goldini, the Venetian dramatist. F. Galanti's volume, entitled "Carlo Goldoni e Venezia nel Secolo XVIII," is one of the best literary monographs produced in Italy. This book, like Antonio Virgili's "Francesco Berni," which also appeared this year, is the result of many years of conscientious work, and is a proof of the way in which literary criticism has advanced in Italy within the last few years.

Count Louis Sernagiotto has written the lives of two Venetian painters, Natale and Felice Schiavoni. A work on Correggio is by a Greek lady, Marguerite Mignaty, and is written in French. Signor Molmenti is illustrating the works of the great Venetian masters; and Signor Bertolotti has compiled in two volumes a curious account of the life of Lombard artists in Rome. All the congresses which have this year met in Italy, and especially the International Geographical Congress of Venice and the International Geological Congress of Bologna, have given birth to a number of special publications and interesting memoirs. Besides these has also appeared this year the second volume of the "Acts of the International Congress of Orientalists at Florence."

Antonio Lubin has written an excellent commentary on the "Divina Commedia." Giuseppe Jacopo Ferrazzi has edited a "Bibliografia Ariostesca." The collected works of Bernardino Zendrini, the translator of Heine, have been published, with a biography. The "Ricordi della Giovinezza di Alfonso La Marmora," by Louis Chiala, is a book of thrilling interest. The twelfth and last volume of the works of Shakespeare, translated by Giulio Carcano, has been printed. Contemporary portraits, "Disraeli and Gladstone," are by Ruggiero Bonghi. The "Codex Astensis" of Malabayla has been carefully edited by Quintino Sella. The first volume of the "Storia della Letteratura in Italia" has been published at Genoa by Emanuele Ceesia. The important "Carteggio Galileiano Inedito" was issued by the Marquis Giuseppe Campori, of Modena. Dr. Giovanni Urtolier de Cesena has published "Lo Statuto Fondamentale del Regno d'Italia," with a commentary.

The most popular of the poets, Giosué Carducci, has issued no volume this year, though he has published a good many poems in different newspapers of republican and naturalistic tendencies. One of these papers, "La Cronaca Bizantina," published in Rome, occasioned some stir and emotion. The "Giobbe" is a satirical poem of another illustrious poet.

Important new Italian novels are the fol-

lowing: "Malombra," by Giovanni Fogazzaro; "Mio Figlio," by Salvatore Farina; "Vita dei Campi," of Giovanni Verga; "Sotto i Ligustri" and "Il Roccio di Sant' Alipio" of Caccianiga; "O Tutto o Nulla" of Antonio Giulio Barrili; "La Contessina" of Enrico Castelnovo; "Sfoghi del Signor Scannavini" of G. L. Patuzzi; "Dalla Finestra" of Grazia Pierantoni Mancini; "Cuore Infermo" of Matilde Serao; "Sull' Orlo dell' Abisso" of Antonio Baccaredda; "Nuovi Racconti" and "Fra Galdino" of B. E. Maineri; and "Entusiasmi," a posthumous novel of Roberto Sacchetti.

NORWAY.—A change is taking place in the character of Norwegian literature. Norway did not feel the impulse of the spirit of romantic nationalism which originated in Germany at the beginning of the century until long after it had elsewhere lost its significance. Consequently, when the chief civilized nations had ceased to regard nationality as a natural attribute, and modern culture as necessarily in antagonism with it and with poetic sentiment, Norwegian writers continued to see in the uncultured rural population of their country the true kernel of Norse nationality and the only objects worthy of their muse, while in their eyes the dwellers in towns were at once prosaic and unnational. Fifteen years ago the first signs of a reaction against this mode of viewing things made themselves felt, and since then the new tendency has gradually been gaining in strength and extent. The self-elation which characterized the earlier literature of Norway has vanished, and we find in its place a self-depreciation equally strongly marked, to which is due the pessimism which distinguishes every modern Norwegian writer of any eminence, and which Ibsen may be said to have initiated.

The most interesting literary productions of the past year are certain novels in which this new bias is especially strongly marked. These works emanate from three young authors, who, under widely different conditions and forms of development, have each of them produced a novel which advocates pessimist views, and which will be found to be essentially similar to the other two in nature and aims. The first to claim attention is "Arbejdsfolk" ("Working People"), from the pen of Alexander Kielland. He writes gracefully if superficially, and looks at the classes below him from a noble and generous although false point of view. The scenes are laid in the uppermost stratum of Norwegian town life, which it depicts as fundamentally corrupt, while its literary character is in strict accordance with the type introduced by Zola in his naturalistic delineations of society. In a shorter story, entitled "Else, a Christmas Tale," Kielland seems to have attempted to follow English rather than French models. Here, too, the heroine belongs to the people; and the narrative is gracefully written, but marred by a want of psychological

discernment. More pleasant, although not so well written, is "Farlige Folk" ("Dangerous Folk"), by Kristian Elster, who died in 1881. A selection of his earlier productions appeared under the title of "Solskyer." The third of these pessimist novels is "Norsk Provinsliv" ("Norwegian Provincial Life"), by John Paulsen.

A new drama by Henrik Ibsen produced an extraordinary sensation. In a literary respect this drama, which is in three acts and is entitled "Gjengangere" ("Ghosts"), is remarkable for naturalism.

"En Valkyrie," by Nordahl Rolfaens, is a domestic play based on an historic foundation.

Among the scientific productions of the year must be included the last part of Professor O. Rygh's "Norske Oldsager," as well as Dr. Y. Nielsen's "History of the Development of Civilization in the Rural Districts of Norway in the Later Centuries," and Dr. A. C. Bang's "History of Julian the Apostate."

POLAND.—Among the notable historical works are Stan. Smolka's "Miecislaus the Old and his Times"; Joseph Szujski's "The Renaissance and the Reformation in Poland," which shows erudition and gives a detailed account of that period; and Fr. Piekosinski's book "On the Rise of the Polish Commonwealth," in which the author offers a new hypothesis about the origin of the Polish nation and the first organization of its estates. Of Bobrzynski's "Outlines of the History of Poland" an enlarged edition was issued. "The Life of Count Adam Czartoryski," by Bron. Zaleski, remains unfinished. T. Wojciechowski's "Kasimir the Monk," one of the early kings of Poland, develops an historical hypothesis. Among the works of the essay species are W. Przyborowski's "The Country Folk Here and Elsewhere," and A. Kraushar's "Albrecht Laski." The publication of the historical writings left by J. Bartoszewicz has reached its eleventh volume. In this class of literature also fall Pawinski's "Finance System in Poland in the Days of Stephan Batory," J. Falkowski's "Close of the Polish Insurrection in 1831," and "The Neapolitan Debt," by K. Kantecki.

Kraszewski during the past year has published no less than twenty-one volumes of new novels. German translations of some of his novels have recently been published in Vienna. Next to Kraszewski in ability comes T. T. Jez (properly Sig. Milkowski), who has published two historical novels, "Hard Times" and "The Grandson of Choronz." His earlier novels have been translated into French, and Milkowski has since been applying his pen to French literature. Among humorous writers the best are J. Lam, the author of "Wonderful Careers," a cutting social satire, and Boleslaus Prus (properly Glowacki).

In the domain of dramatic poetry comedy predominates. A. Fredro, the younger, does not possess his father's eminent talent, yet inherited the gift of being able to excite laughter.

One of his comedies ("The Mentor") was performed with success in Hamburg. Blizinski during the year published a collection of his comedies, and wrote a new one, called "The Shipwrecked," which is quite equal to his older ones. One of Balucki's best works is his last comedy, "Brilliant Matches" ("Grube Ryby"). In the way of theatrical success all these have been outstripped by the patriotic piece "Kosciuszko at Raclawice," by W. Lasota (a *nom de plume*), excelling in delineation of character and stage effects. In the domain of serious drama belong W. Szymanowski's "The Statue" and A. Urbanski's "Under the Roof," which treats of a painful episode from the insurrection of '63. S. Wedlewski has translated the tragedies of Euripides, and Swiecicki three of Lope de Vega's comedies. The dramatic fragments by Mrs. R. Konopnicka, entitled "From the Past," are, in fact, poems of a liberal tendency. The author has won more fame by her lyric poems, which are distinguished by their artistic form, while the subjects are generally connected with social questions of the day. Other lyrics are J. Chamicc's "Autumn Songs." Dr. A. Weisz has published in Leipsic a German translation of Mickiewicz's masterpiece, "Thaddäus." P. Soboleski has rendered similar service to the national literature by a work published by him in Chicago, in English, entitled "Poets and Poetry of Poland: a Collection of Polish Verses, including a Short Account of the History of Polish Poetry."

From the other branches of literature should be mentioned a work by the critic P. Chmielewski, "Outlines of Polish Literature during the last Sixteen Years," W. Spasowicz's studies on the two Polish poets Pol and Syrokomla, and his admirable history of Polish literature contained in the "History of the Slavonic Literatures." A. Reman, a botanist and traveler, has published "Sketches from a Journey to South Africa in 1875-'77; and J. Finkelhaus, "Pictures from Life in Northeastern Africa." The collected works of J. Kremer, the philosopher, and those of L. Sieminski, the æsthetic writer and poet, have appeared. The Counts Przewdziecki have completed the publication of the works of the old Polish historian Dlugosz (fifteenth century).

PORTUGAL.—The only symptoms of vitality apparent in Portugal are those evoked by the conflict between the aspirations of the people, the power of the Government, and the institutions of the country. Many of the publications of the year demonstrate the existence of the struggle which is going on between opinions and institutions, and various works of history and poetry attest intellectual independence. Oliveira Martins's "Portugal Contemporanea" gives a complete picture of Portuguese history from the death of Dom John VI in 1826 to the present time, and exhibits new democratic and socialist aspirations in opposition to effete monarchical principles.

The professor and democrat, Rodrigues de Freitas, has written a review of this book in which Dom Miguel, whom Senhor Martin describes as a generous enthusiast, is proved to have been a despot. The "Traças de Historia Contemporanea," by Senhor Antonio Teixeira de Macedo, founded upon the parliamentary memoirs of Passos Manoel, discourses upon the revolution of September, 1836, and shows the efforts of the house of Braganza to stifle the national movement in behalf of a constitution. Gomes de Amorim has published the first volume of a work on the writer Almeida Garrett. Counselor Antonio de Serpa has published a book called "Alexandre Herculano e seu Tempo."

There is now published a journal of caricature, "O Antonio Maria," supported by the admirable pencil of Raphael Bordalo Pinheiro and the incisive pen of Ramalho Ortigaõ. Gomes Leal has published a small poem in alexandrines entitled "A Traição," which satirizes King Dom Luiz with regard to the treaty of Lourenço Marquez. It was much read and applauded, and it was only after the issue of the fourth edition that the Government ordered the apprehension of the writer; they were, however, obliged to liberate him after three months' detention, without bringing him to trial. Leal also published two other poems conceived in the same vein, "O Hereje" and "O Renegado."

The first volume of the "Portuguese Plutarch" contains the biographies of the Infante D. Henrique, Vasco da Gama, Camoens, D. João de Góes, D. John IV, Padre Antonio Vieira, Marquis de Pombal, Luiza Todi, Correa de Serra, Bocage, Monsinho de Silveira, and Herculano. The second volume contains the biographies of Sá de Miranda, D. Francisco de Almeida, Fernão de Magalhães, Infanta D. Maria, D. Manoel, Felix de Avellar Brotero, Duque de Lafões, José Anastacio da Cunha, Fernandez Thomaz, Domingos Antonio Sequeira, and Garrett.

A large volume has just been published on "Questões de Litteratura e Arte Portuguesa," in which are treated the personality of Gran Vasco, the Portuguese nationality of Amadis de Gaul, and the artistic style of Gil Vicente, founder of the Portuguese theatre.

Teixeira Bastos, one of the most devoted apostles of positive philosophy in Portugal, has published "Comte e o Positivismo." The same writer publishes a series of "Estudos sobre a Historia da Humanidade," a book of verses, "As Vibrações do Seculo," and a book of political philosophy, "A Dissolução do Regimen Monarchico Representativo."

Investigations regarding Portuguese folk-lore are being prosecuted, and in numerous reviews, such as the "Positivismo," the "Era Nova," the "Pantheon," the "Vanguarda," and the "Revista de Gtologia e Ethnologia," there have appeared articles respecting the poetry, traditions, and ethnology of the Portuguese

people. F. Nogueira has published a volume on "A Raça Negra," considered with respect to African civilization. The "Arquivo dos Açores" is a collection of historical documents, throwing light on the history of the Azores.

Russia.—Two of the most eminent of Russian novelists, Dostoyevsky and Pissysensky, died in January. Russia has but four first-class novelists left: Gontcharoff, Leo Tolstoy, Tourguénief, and Stchedrin, the last, however, more of a satirist than a novelist. The two former maintained literary silence during the year. Tourguénief published two small sketches, entitled "Portraits of Former Days," and a fantastic novelette, "The Hymn of Triumphant Love."

Russia's literary hero this year has been Stchedrin, who has completed his satirical epos "Beyond the Frontier," and commenced a fresh series of satirical sketches under the title of "Letters to my Aunt." Stchedrin for more than twenty years has been a faithful sentinel standing guard over Russian social life, and at the least sign of danger threatening the national liberty and happiness he has sounded the alarm. For this reason Stchedrin's satirical sketches are read with avidity by the public and cordially detested by the reactionary press. Behind the thin veil of easy satire it is not hard to discover the aching heart of the patriot. Obligated to conform to the rigorous laws enforced by a suspicious censorship, Stchedrin has invented a style of his own, quite intelligible to his readers, and yet proof against the scrutiny of the censor.

The satirico-realistic school, founded by Gogol, has met with favor. Among the more remarkable novels belonging to this type is S. Atava's "Growing Poor," a series of sketches from the life of a country gentleman, who wishes to improve the condition of the peasants and the value of his land, but is deceived by swindlers and ruined in speculations. The same subject is treated by Stakhyéeff in "On the Decline." In Saloff's novel, "The Young Squire of Olshana," a land-owner commences a career of improvement, but finding himself, as well as the people, a victim to deception, he loses his faith in humanity and himself takes to cheating. What has thus been done for the squirearchy, Gleb Ouspyensky has done for the peasantry in "Rural Disorganization." Other novels of the year are by Lyeskoff, Severin, Avsyénko, Byelinsky, Snitko, Kouststchevsky, Boborykin, Stcheglof, Madame Olga Shapir, and others. Markyevitch has tried to connect the plot of his novel "Crisis" with the origin of Nihilism. W. Krestovsky has devoted "Egyptian Darkness" to a gloomy description of the life of the Jews for the last two generations in Russia.

Russian poetry has been very poor. A few unpublished poems of Pushkin and Nekrassoff have been given to the world. Madame A. Lyoff's poems promise a fair future. Nyemiro-

vitch Dantchenko, hitherto known as a traveler and novelist, has also added his name to the list of poets.

The drama has been equally sterile. Ostrovsky has completed another comedy, his forty-third, "Obedient Wives." Palm's new comedy, "The Electors," is a lively piece. A play by Kryloff, entitled "The Municipality Dissolved," is full of scenes from provincial town life and very humorous.

In the domains of learning and research Russian writers have devoted themselves lately more particularly to the past, present, and probable future condition of their own country. Count Ounvaroff has published "Archæology of Russia: the Stone Age." Contributions to the ancient history of Russia have been made by Professor Drozdovsky in his researches on the chief monument of ancient Russian legislation, the so-called *Russkaya Pravda*; by Bogolyëg, "History of the Principality of Tchernigoff"; and Professor Klyoutchevsky in his work on "The Council of Boyars in Ancient Russia," which not only gives a history of that legislative assembly, but also of the society of the period. "The Power of the State in Russia in the Eighteenth Century," by Professor Dityatyn, and a very good work by B. Semeffsky, "The Peasants during the Reign of Catherine II," are the only two books treating of the eighteenth century. Senator Rovinsky's "Russian Popular Woodcuts" is valuable to the student of the history of manners and customs; it describes nearly five thousand woodcuts, and includes about four hundred reproductions. Among other historical works may be noted Preobrazhensky's "Moral Condition of Russian Society according to Maximus Græcus and other Contemporary Authorities," Prokhoroff's "Materials for the History of Russian Costume," and Soumtzoff's "Marriage Rites of Russia." An interesting addition to the history of the nineteenth century has been furnished by Zablotsky-Desyatoffsky in a biography, "Count Kisselyeff and his Times." The author has been able to make some remarkable disclosures. No insignificant number of memoirs has been published, among others those of Boutyenyeff, a diplomatist of the time of Catherine II and Alexander I, of Madame Karatygin, and the letters of Count Rostopchine, the Metropolitan Filaret, etc. Professor Ivanyoukoff's latest work is entitled "The Abolition of Serfdom in Russia." Professor Kotlyarevsky has published a "Bibliographical Essay on Early Russian Literature," Professor Alexander Vyessylovsky "Researches upon Russian Popular Religious Songs," and Vyessin a "History of Journalism in Russia." Parts of Professor Korsch's "General History of Literature," and the second volume of Porfiryeff's "History of Russian Literature," have appeared. In Professor Vinogradoff's "Origin of Feudalism under the Lombards," the principal conclusion at which the author arrives is, that in Italy, in the ninth and tenth

centuries, the connection between the dependence of the vassal and the *beneficium* had not yet become necessary. On ecclesiastical history the most important book is the second volume of Professor Goloubinsky's "History of the Russian Church." Znamyensky's book on "The Ecclesiastical Schools of Russia before their Reform in 1802" is also an interesting addition to church history. Toward universal church history Lybydyff's book on the "Ecumenical Councils of the Fourth and Fifth Centuries" is a valuable contribution, as is also Professor Ivantzoff-Platonoff's "Religious Movements in the Eastern Church in the Fourth and Fifth Centuries." "Russian Religious Sects," by Youzoff, is a work of great interest.

Philosophy has not been fruitful, and with the exception of Professor Vladislavlyeff's "Psychology" and "Lectures on the Philosophy of Religion," by Professor Koudryatsyeff, there has been nothing original.

Some interesting works of travel and geography have appeared, notably a work by Professor Minayeff on "Ancient India." This is a detailed review of the notes of a Russian traveler in India in the fifteenth century, one Nikitin, which have been translated into English by Count Vyelgoursky. Potanin's "Sketches of Northwestern Mongolia," a description of a trip taken in 1876-'77, and Kal'kovsky's "Round the World," are vivid descriptions of the countries they deal with. The same may be said of Colonel Kaon'bar's "Notes on Montenegro," and Ogorodnikoff's "In the Land of Freedom," the result of the author's travels in North America. Ragozin has published the second and third volumes of his "Geographical and Ethnographical Description of the Volga."

In political economy, Professor Yanzhul's treatise on "The Salt Duties and the Result of their Abolition in England and Russia," may be mentioned. Professor Yanson's "Statistical Investigations of the Imposts paid by the Peasants," Odartchenko on "The Russian Village Community in Connection with the National Character," and a work by Isayeff and Stcherbin on Russian *artelys* (a sort of co-operative labor mutual liability association), are important economical works.

SPAIN.—The Madrid "Bibliófilos," after reprinting Padilla's "Romancero," have published for the first time the "Relacion de la Jornada de Pedro de Ursúa á Omagua y al Dorado," by an anonymous writer, a faithful picture of the atrocities committed in those parts by Pedro de Aguirre, followed by the "Cancionero General de Hernando del Castillo," first printed at Valencia in 1511.

Of the "Documentos Inéditos para la Historia de España" two more volumes, "Guerras del Perú," by Pedro Cieza de Leon, and a history, hitherto inedited, of the reign of Philip IV, have appeared.

Aribau and Ribadeneira's "Bibliotheca de Autores Clásicos Españoles" terminated with

a full index to the seventy volumes of which it is composed.

Poets lyrical and dramatic abound in Spain. Within the year were issued, among others, "Poesías Festivas," by Blasco, besides another volume of "Epigramas," and "Aires d'a Miña Terra," by M. Curros Enriquez. This is the second edition, the first having been denounced and suppressed and its author excommunicated. The collected works of the late Duke of Rivas have been reprinted, with an introductory notice by Don Antonio Cánovas del Castillo, the late Premier. J. B. Ensenat, García Lavín, and Marín y Carbonel at Saragossa, Trueba and Verdagner at Barcelona, Velarde at Seville, and a host of other poets, show that the taste for rhyming is not extinct. Campoamor's little volume of poetry entitled "Los Buenos y los Sabios," Echegaray's "Gran Galeoto," and Zorrilla's "Recuerdos del Tiempo Viejo," must be mentioned with praise.

Fernandez y Gonzalez, Valera, Alarcon, Blasco, and Pereda have long amused the public with their fictions. Two new novels by the first named are entitled "La Sobrina del Cura" and "La Leyenda de Madrid." "Medina Zahara," an historical legend by Alcalde, is deserving of notice, as well as his "Canto Epico de Lepanto," perhaps the sole attempt in epic poetry made this year in Spain. "Nuevos Cantos," by Narciso Campillo, "El Primer Loco," by Doña Rosalia Castro de Murguía, and "Heliodora," an operetta by the son of Hartzenbusch, are other productions in light literature.

The "Cervantistas," as they style themselves, have been comparatively idle of late, and the affections and sympathies of Spaniards would appear to have been suddenly transferred to another national idol, the great Don Pedro Calderon de la Barca, whose second centenary was celebrated in May. Innumerable compositions in prose or verse poured in from all parts of the ancient Spanish monarchy, from America and the Philippine Islands, as well as from Portugal and Germany; and the festival has brought forth a selection of Calderon's dramatic works in four volumes, by Menendez Pelayo; an "Album Calderoniano," by Spanish and Portuguese poets; "Homenaje á Calderon," anonymous; and several more works. In September the Congress of American Scholars and Writers (Congreso de los Americanistas) met. It was attended by delegates from all quarters of the globe, especially from France, Belgium, and Germany, as well as from remote parts of America where the Spanish language is still in use. The Government published a splendid volume entitled "Relaciones Geográficas de Indias," for distribution among the members of the congress. The editor is Marcos Jimenez de la Espada, the indefatigable writer on the geography and history of South America. The "Relaciones" are all original, and taken from the Archivo de Indias in Seville, a vast repository of papers and documents relating to America and Asia in general

and to the West Indies in particular. They form part of a collection prepared in Philip II's time, with a view to a statistical and political survey of the Spanish monarchy.

In the department of history a few valuable works have appeared, such as "Las Ordenes Religiosas," by Antequera; "Historia Crítico-Filosófica de la Monarquía Asturiana," by Menéndez Valdés; "Galería de Jesuitas Ilustres," by Father Fidel Fita; "Historia de los Heterodoxos Españoles," by Marcelino Menéndez Pelayo; "Doña Ana de Silva y Mendoza," by Julian Saenz de Tejada; "Bosquejo Biográfico de Don Beltrán de la Cueva," by Rodríguez Villa; and "Boceto Histórico: Cánovas, su Pasado, su Presente y su Porvenir," by Saurín. The "Cancionero Vasco" by Monterola, "La Danza, Poesía Bable" by Cuesta, "Las Libertades de Aragón" by Danvila, the "Discurso de la Comunidad de Sevilla" by Benítez de Lugo, "La Inundación de Levante" by Bermejo, and "Estudio de Toponomástica Catalana" by Sanpere y Miquel, a work of great research, demonstrate that Galicians as well as Asturians, the Basques and the Catalans, are doing all they can to preserve their languages or dialects, and save their separate histories from oblivion. Laudable efforts of this sort are being made at Barcelona, where the cultivation of science and literature has lately made such progress as to render this great commercial city in many respects almost a rival to Madrid itself. Tarragona, Lérida, Gerona, and other towns of Catalonia, and generally of the "Coronilla de Aragón," are likewise making rapid progress.

SWEDEN.—Count Carl Snoilsky has issued a volume, "Nya Dikter" ("New Poetry"), which must be considered as the most notable collection of verse published in Sweden during the year. Its spirit is in an eminent degree patriotic. He deals with topics derived from Swedish history. The volume contains, besides, a great many poetical idylls and sketches of travel in Europe and Algeria. Noteworthy is a commentary, as it were, published by the lady who shares his wandering life.

Another younger poet, A. U. Bååth, not equal to Snoilsky but yet a genuine poet, has published a new volume. A mixture of verse and prose fills a volume entitled "Recollections from Youth and Travels," by the popular author N. P. Oedman, a work distinguished for vivacity and humor.

Two works of the older poets are worthy of mention, the first installment of F. W. Schölander's posthumous writings and G. Wennerberg's collected works. O. W. Böttiger's "Valda Dikter" ("Selected Poetry") and "Sjelfbiografiska Anteckningar och Bref" are posthumous publications. A memoir was published of Peter Fjellstedt, the missionary, by Mrs. Emilia Laurin.

In political history F. F. Carlson's great work, "Sveriges Historia under Konungarne af Pfalziska Huset," has now reached the beginning of the reign of Charles XII. Schinkel's

"Recollections of the Modern History of Sweden" has been continued for a great many years, but by different authors; the last installment, treating the years 1828-1835, is written by O. Alin. C. G. Starbäck's "Narrations from Swedish History," continued by P. O. Bäckström, are now concluded. The great illustrated "History of Sweden from the Earliest Times to the Present Day," compiled by different authors, is approaching completion. Four numbers of the sixth and last volume have already appeared. Among special works in political history J. Mankell's treatise on the policy of Gustavus II Adolphus, in which the author maintains the opinion that the King was influenced by the ideas of a conqueror rather than by those of a champion of faith, has aroused animated disputes. August Strindberg has commenced a work with the title, "The Swedish People during a Thousand Years," with engravings by Carl Larsson. The work caused great excitement in Sweden, and many polemical writings have followed.

Eichhorn has with a new volume, "Swedish Studies," contributed to the history of literature. To this department belong "Nektar och Gift," and the continuation of "Svenska Hofvets och Aristokratis Historia," by Arvid Ahnfelt. Professor G. Ljunggren has published a new volume of his "Annals of Swedish Literature." A work of particular importance is "Philosophical Investigation in Sweden," by Professor A. Nyblæus. To the knowledge of the life and manners of the Swedish people Arthur Haze-

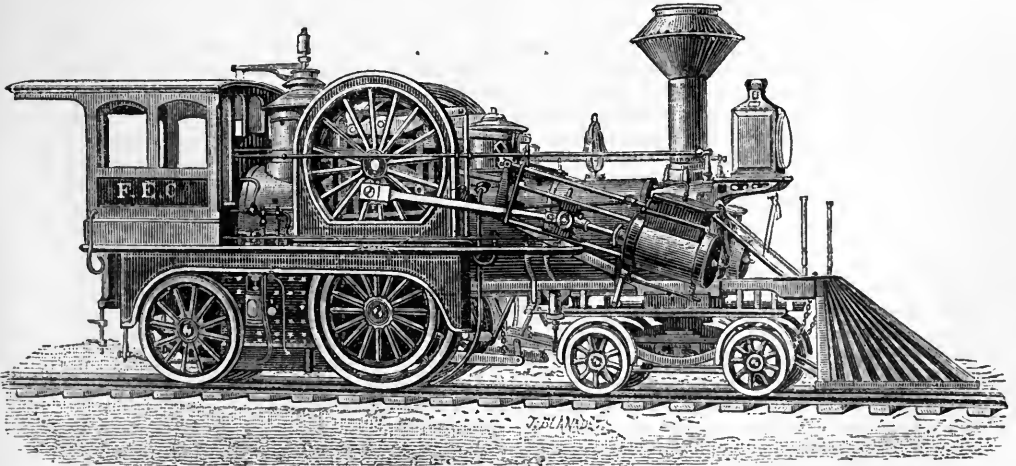

lius has made an important contribution by the publication of "Contributions to the Annals of our Culture," of which G. Retzius has written the first part, describing the ancient culture of Finland.

"Spada" has published a collection of lively and picturesque sketches made during a sojourn in the East. "From the Polar Circle to the Tropic," by "Jörgen" (Georg Lundström), contains, besides a quantity of interesting descriptions, a fair proportion of satire.

Mrs. H. Nyblom, the well-known novelist, has published a collection of tales, while two anonymous ladies have published, one a novel, entitled "Marianne," the other "From the Forest." A collection of "Stories and Fantasies" is by Ernst Lundqvist.

Nordenskiöld's celebrated work, "Vegas Färd kring Asien och Europa," has appeared both in Swedish and in several translations. It will be followed by several supplementary volumes, containing partly popular essays and observations by the partakers in the Vega expedition, partly strictly scientific treatises respecting the results of the voyage, to be published at the cost of the state.

LOCOMOTIVE WITH DUPLEX DRIVING-WHEELS. A new type of railroad locomotive engine, called from the name of the inventor the Fontaine locomotive, has been tested by practical use on the Canada Southern Railway. The results recorded in speed and duty are so remarkable as to have attracted the attention of engineers all over the world. The

THE FONTAINE LOCOMOTIVE.

construction is not only very peculiar, but conflicts apparently with the recognized principles of mechanics. Hence, when first described, the Fontaine locomotive shared the fate of many other important inventions: it was condemned on theoretical grounds, and even derided by high engineering authorities.

The peculiarity of the engine is that it has two sets of driving-wheels, one on top of the

other. The main driving-wheels in the Fontaine engines are secured to an elevated axle, above the boiler, and running in boxes supported by a suitably braced frame, the cylinder and piston-rods being set in an inclined position.

These driving-wheels are of the usual construction, but do not touch the rails. Resting on the rails are other driving-wheels of the

same size as the upper ones, with which there is a frictional contact. There being no resistance, when motion is communicated to the upper wheels, the same motion is transmitted to the lower ones by friction. The contact between the main driving-wheels, which are actuated by the machinery, and those which draw the train by the force communicated to them, is not at the outer periphery of the latter, which runs on the rails, but at a second tread, which is much smaller in diameter. By this device, although the circumference of the two wheels is about the same, the wheel which rolls over the rails revolves more rapidly than the upper one, which turns synchronously with the strokes of the piston.

To prevent slipping, an air-pump is employed, which is operated from the cab, and which acts on a system of levers, by means of which the frictional contact between the upper and lower drivers is diminished or increased, as occasion may require, without disturbing the bearing of the lower wheels on the rails. The engine is also provided with an equalizing truck, so as always to preserve the bearing on the rail. The parts are so arranged that the center of gravity of the locomotive will not be so elevated as to render it liable to leave the track in turning curves.

An increase of the speed of locomotives as ordinarily constructed can be attained only by an enlargement of the driving-wheels, or by an increase in the number of the strokes of the pistons. To enlarge the drivers beyond a certain limit is found objectionable, since by so doing the center of gravity of the locomotive is so elevated as to cause a swaying or gauge motion, and the locomotive is liable to leave the track, especially on curves; and it is found impracticable to materially increase the number of reciprocations of the piston, except at the expense of fuel and the straining of the boiler to carry steam at such a pressure as to overcome the expansion of steam in the cylinders.

By means of this ingenious and boldly novel manner of applying the power through auxiliary drivers, a large increase of speed is obtained from a given size of driving-wheel, without increasing the number of piston-strokes or the amount of fuel consumed. Or, at a constant rate of speed, a heavier load can be hauled with the same consumption of coal, owing to the completer development of the effective force of the steam. The Fontaine locomotive has a theoretical advantage over engines of the ordinary type of 80 per cent in speed or traction, and a practical gain of 30 per cent over engines of the same size is claimed to have been demonstrated. An engine of the new type has drawn a train over the Pennsylvania Railroad between New York and Philadelphia at the rate of 90 miles an hour. The second engine built on this model, made at the Grant Locomotive Works, in Paterson, New Jersey, has a total length of wheel-base of 21 feet 5

inches, being constructed for a track of 4 feet 8½ inches gauge. Its total weight, loaded, is 62,000 pounds; weight on the driving-wheels, 32,000. The driving-wheels are 70 inches in diameter, the friction-tread 56 inches in diameter, and the upper driving-wheel 72 inches in diameter. The stroke of the cylinder is 24 inches, diameter of cylinder 16 inches. The tank has 2,000 gallons capacity. There are 140 tubes, 2 inches in diameter and 11 feet long. The grate is 62½ inches by 33½; the total heating surface, 906 square feet.

LOCOMOTIVE, COMPRESSED-AIR. Several quite workable compressed-air motors have been tried and put into practical employment upon street-railroads with partial satisfaction in France, Belgium, Great Britain, and the United States. None of the devices for the use of compressed air thus far invented has stood, however, the practical and commercial tests of utility and economy, although every effort was made in the cases of some of these to make them succeed. Notably, the Mekarski air-engine, which was tried in Paris, received abundant financial support, and was only abandoned after a thorough trial. Scott Moncrieff, of Glasgow, built an engine from which good results were obtained as far as its mechanical workings were concerned, but which never advanced beyond the experimental stage. The idea was not likely to be abandoned, however, after many failures, on account of the peculiar adaptation of compressed air to mechanical motors for street-railroads. Steam is too destructive and uncontrollable an agent to be used directly on street-railroads, aside from the serious inconveniences of smoke and noise, which no devices yet invented have been able to obviate to a sufficient extent.

The employment of compressed air as a vehicle for storing up mechanical energy to be used at a future time or at a distance is attended by two serious difficulties. The first is the technical difficulty of the construction of reservoirs and joints so hermetically tight as to prevent leakage, and the fatal loss of power which it entails if the motive power is to be stored up for any length of time or transmitted any distance. The second difficulty is due to a universal property of gaseous matter, explicable by the kinetic theory. The application of pressure to any aeriform fluid is attended by a rise in temperature and a proportionately greater resistance to be overcome in obtaining a given degree of compression. If the compression is performed very slowly and gradually, no increase in the sensible heat of the gas occurs, and consequently no loss of power; but it is impracticable to conduct the operation with such extreme slowness that the molecules of the gas are not excited to greater kinetic activity, which is the cause to which the excess in the increase of pressure due to rapid compression, the increase which is attended by a rise in temperature, is attributed. The compression which takes place at such a rate

as to produce heat is called *adiabatic compression*; while that which is slow enough to allow the molecular particles to accommodate themselves to a more crowded condition, to shorter paths and more frequent impact, without causing the disturbance, the temporary acceleration of molecular velocity and augmented violence of impact, which is marked by a rise in temperature, is denoted *isothermal compression*. If the energy stored in the elastic fluid were instantly utilized, the work performed would be the same, whether the pressure were *idiobatic* or *isothermal*; but if there is a sufficient interval allowed to lapse for the energy which has been converted into heat to be lost by the radiation of the extra heat, there is a waste to the extent of the power required to produce the elevation of temperature. A corresponding loss of energy takes place in the application of the stored-up power, which must from the nature of the case be rapid also, and a rapid expansion is attended by a diminution of the potential energy equivalent to the loss resulting from an equally rapid rate of compression. This is due to the reduction in the temperature produced by sudden expansion, which lessens the elastic tension of the fluid in a corresponding degree. This double loss of efficient power attends every employment of condensed air for the preservation for future use or for the transmission of mechanical energy. It is used in mines for drilling, not because it is an economical power, but because it can be so handily applied and so readily regulated. There are reasons which would make the use of compressed-air locomotives desirable for some purposes, though they should consume considerably more fuel than steam locomotives. French and Belgian engineers some time since discovered a method of neutralizing the changes in temperature due to compression and expansion, and thus increasing the duty of pneumatic engines considerably. They kept the compression and expansion *isothermal* by artificial means, injecting a spray of cold water into the compression-cylinder and a spray of hot water or a jet of steam into the expansion-cylinder. It was only a partial remedy, since the heat of compression, which is absorbed by the particles of cold water, is not utilized, nor is the heat that is imparted to the hot water which is introduced into the expansion-cylinder to keep up the temperature and effective force of the compressed air while undergoing expansion. Yet it served to preserve the kinetic equilibrium of the gas, and enhanced very materially the efficiency of the air-engine. The loss of power attending this artificial method of equalizing the temperature, and making the tension of the confined air vary uniformly with the pressure applied, is not very great; and, what is of the highest importance as regards the employment of compressed air in locomotives, it is proved by theory and substantiated in practice that this loss is directly proportional to the degree of compression.

The size and weight of the reservoirs and other apparatus consequently depend in a great measure upon the degree of compression which can be practicably attained. An improvement upon the Continental method of maintaining a steady temperature in the air under pressure has been in use for some time in the pneumatic apparatus of the Royal Arsenal at Woolwich, England, used for compressing air to a high degree of pressure for the propulsion of torpedoes. The injection of the spray into the cylinders requires the use of valves and other attachments. More or less leakage will occur through the joints. If the compressed air is used at a high degree of pressure, this would prove a fatal defect. To obviate this leakage, the Woolwich engineers employed in place of the injecting apparatus a simple jacket of cold water around the compressing cylinder. This technical improvement, allowing of the use of compressed-air power at very high pressures, led Colonel Beaumont, of the Royal Arsenal, to the study of a system of compressed-air locomotives worked under extreme pressure, in virtue of the principle that high degrees of compression, when kept *isothermal*, are obtainable at virtually no greater relative cost than lower pressures. He obviated the loss of power in expansion by steam-jacketing the expansion cylinders, which improvement afforded all that was wanting for the *isothermal* compression and expansion of air at high pressures. Colonel Beaumont has employed himself a long time upon the elaboration of his system of compressed-air motors, and has developed an air-locomotive which works satisfactorily as far as experimental tests can show, and in long and searching trials has not only proved itself practicable, but in the points of reliability, durability, manageability, noiselessness, and, above all, of economy, it appears to be a complete success, which promises to remove the question of a compressed-air locomotive-engine finally out of the category of mechanical problems.

Colonel Beaumont has built an engine which performs the trip from the arsenal to Dartford and back, a total distance of about thirty miles, with one charge of compressed air, taking sixty-three minutes. His locomotive weighs ten tons. It can carry a load of sixteen tons up a moderate grade. The reservoir is charged with one hundred cubic feet of air under a pressure of one thousand pounds on the square inch. The first locomotive made on his system had three cylinders on each side for the purpose of expanding the air down. It is parted with in the last at little above atmospheric pressure. He uses no expanding apparatus to reduce the pressure before turning on the air, but lets it into the cylinders at the full pressure of one thousand pounds. The cylinders are completely air-tight practically, being able to retain the charge for several hours without any material reduction of pressure. The form first used consisted of a number of strong tubes con-

nected by cross-pieces. A later form consists of a welded cylindrical vessel with only one opening serving for both inlet and outlet, closed by a spindle-valve, with conical seating, similar to an ordinary safety-valve. The six cylinders are reduced to four in a newer form of the locomotive. Colonel Beaumont claims for his system an economy equal to or greater than that of the steam locomotive-engine. The fact that the work done by the ordinary locomotive requires three sets of machinery in a compressed-air locomotive—the engine for driving the compressing apparatus, the compressing apparatus itself, and the expansion-engine which drives the locomotive—militates against such a claim. The advantage of the stationary steam-engine over the locomotive steam-engine amounts to the difference between $1\frac{1}{4}$ pound of coal per horse-power per hour, which is the highest duty yet attained, and three pounds per horse-power per hour, which is the consumption in Daniel's locomotives. This economy must be more than counterbalanced by the friction of the triplex machinery, the cost of the jacketing, etc. There is, however, a considerable saving in dead weight in the substitution of air for water and in the reduced size of the vessels and apparatus. A joint-stock company has been formed in England for the purpose of making and working the Beaumont air-engine. The advantages of being free from all smoke, having no fire, and making no smell, being comparatively noiseless, of being perfectly safe from the danger of explosion from the exhaustion of water in the boiler, of running no risks of the tubes leaking or the feed-valves sticking, commend it as a great improvement over the steam-locomotive for use in streets, or in long tunnels.

LONGFELLOW, HENRY WADSWORTH. (See "Annual Cyclopædia" of 1882.)

LOUISIANA. The Constitution of Louisiana, adopted in 1879, provides for a session of the Legislature in 1880, and there is no provision for any other before January, 1883. The Governor of the State, however, found it necessary to call a special session "to enact laws making appropriations to defray the ordinary expenses of the government, to pay the interest on the public debt, to support the public schools, universities, and public charities in the State of Louisiana for the years 1882-'83, to make appropriations concerning the State-House, for the redemption of State-House warrants, and for the removal of the seat of government," and other purposes.

The Legislature accordingly assembled at New Orleans on December 5th, in special session. The President of the Senate, and *ex-officio* Lieutenant-Governor, W. A. Robertson, presided in that body; and Speaker Ogden, of the former session, presided in the House. The message to the Legislature came from the Lieutenant-Governor, S. D. McNery, in consequence of the recent death of Governor Wiltz. This event, as also the death of Presi-

dent Garfield, were, in the message, very kindly presented, as follows:

Before alluding to the particular subjects which are submitted to the General Assembly, it devolves upon me to announce to you, officially, the great national calamity which visited the people of the United States in the death of the Chief Magistrate, James A. Garfield, on the 19th day of September, 1881. He had gone into office under exceptionally favorable circumstances, and much was expected from his administration. Political dissension had engendered sectional hostility, but on the accession of the late President there was a general confidence among the people that his administration would be conservative, just, and impartial, and its termination was looked forward to with anxious hopes that with it would cease all sectional animosities, and that one section of the Union would no longer traduce the other, solely for the purpose of acquiring political power and dominion. It was this belief, which had grown and strengthened each day as his administration progressed, that caused the people of this State, in every city, town, village, and hamlet, to give expressions of genuine sorrow and grief at his untimely death.

In the State of Louisiana we have been overtaken by a misfortune which has weighed heavily upon our people, the death of our young Governor, Louis Alfred Wiltz, in the thirty-eighth year of his age. He had long been in public life, commencing at an early age. Few men of his years had the same varied experience in all the departments of government, from the lowest to the highest, all of which he filled in succession. His promotion was from one position to another in regular progression, thus showing that he has filled all places to the credit of himself and to the advantage of the public. As was said in the proclamation announcing his death, the people of Louisiana "will revere the name of him who always strove to pay with honest service for every honor received."

On the 17th day of October, in pursuance of Article LXII of the Constitution, I took the oath of office as Governor of Louisiana.

The chief objects of the special session were to provide an adequate revenue for the State, and to make the required appropriations, and thus render the financial condition more satisfactory. The expenditures largely exceed the revenues. The appropriations against the general fund for 1880 and 1881 amount to \$1,423,829.71. The revenue from licenses and taxes, general fund, for the same period, actual and estimated, amounts to \$758,944, showing a difference between the estimated revenue and the appropriations of \$664,885.71.

The constitutional limit of taxation is not the cause of this deficiency. The revenue derived under that limit would be more than sufficient, if collection of taxes could be made to operate upon the taxable property of the State. The revenue laws from year to year have been progressively growing less efficient. Large amounts of property, movable and immovable, have escaped taxation. There is no uniformity anywhere in the State. As a consequence, some portions are paying on a high valuation a large tax, while others on low assessments are paying but a small tax. The valuation on productive real estate of the same grade varies from five to twenty dollars per acre. There is a universal demand for remedial legislation. The remedy is plain, and the means pointed out by the Constitution are ade-

quate. A recent convention of collectors and assessors demonstrated that, under the present system, no equitable assessment could be made, nor could the collection of taxes be adequately enforced. Those paying on the highest valuation were really paying four times the tax on the same grade of land that is paid in a neighboring parish. In some localities the revenue of the property is taken for its actual value, and the assessment is made accordingly. Thus, when a piece of property yields a revenue of \$40,000, it is assessed at the same figures, when its assessment in reality should be not less than three times that amount. The State Commissioner of Agriculture estimates the annual productive capacity of this State, from agricultural products, to be \$75,000,000, and, if the same improper rule were to be followed, the assessment-rolls should show only this amount.

The Constitution intended to secure a revenue from licenses, and to so graduate the system as to make every calling pay only its just proportion to the support of the government. But the provisions of the present law operate so as to defeat the intentions. While there may be a uniformity of grade among the same class, it so discriminates as to others as to be very unequal and unjust. Occupations which ought to contribute a large sum pay comparatively nothing, while the burden falls on those who derive the smallest income from their occupation. The largest capitals pay comparatively the smallest license-tax.

The amount derived from licenses under the present law is \$200,000; under the former system the revenue from this source was \$400,000. The forfeited and delinquent property for non-payment of taxes has been continued on the assessment-rolls for the current years, and there is some doubt about selling this description of property for the taxes of 1880-'81, lest the State should lose the back taxes. An act provided for the sale of this property on the first Saturday in each month, and from day to day thereafter. There are very few parishes—not more than three—in which this provision of the law has been complied with. In nearly every case the sale has been made on a different day. Valuable properties, on which the State had a claim for taxes, have been sold for insignificant sums, the owners being generally the purchasers. These sales are declared to be absolutely null and void, having been made in violation of law. It is estimated that the back taxes amount to nearly \$5,000,000.

In the parish of Orleans there are judgments for taxes and licenses to the amount of \$600,000. The Attorney-General states that it is difficult to execute the judgments in these cases, because some have been settled, and it does not appear from the records what payments have been made. Therefore legislation is necessary to provide the means for the employment of experts to investigate these judgments, and ascertain which of them are in force.

The Governor speaks in his message in enthusiastic terms of the prospects of the State: "The outlook for the State is most hopeful. The advantages of soil and climate are nowhere else equaled. No country presents such advantages of water communication. Nearly every locality is reached by a navigable stream. Their resources are attracting attention, and despite adverse circumstances a wonderful development of those resources is going on. Trade and commerce are increasing, extended railroads are in process of construction, and manufactories are attracting universal attention. Immigration begins to turn toward the State. A most amicable feeling exists between the two races. Race prejudices have subsided, and the people, white and colored, are a unit in striving to develop the resources of Louisiana. Recent investigations have shown that nearly every vegetable, plant, and tree that springs from her soil can be utilized and made profitable. In fact, there is a wonderful diversity in our products of fruits, cotton, sugar, rice, corn, and other cereals, while valuable fibrous plants are now being introduced. Attention is being given to stock-raising in some of the parishes, and in a few years our stock-raisers will be able to supply the home demand for horses and mules. The future for Louisiana is a grand one. It does not seem chimerical, when we look at our extraordinary advantages, to anticipate a future maximum production to the value of \$500,000,000 per annum.

"There is no reason, then, for the continued cry of 'Poor Louisiana and her impoverished people.' We must realize the fact that she is rich, and force her to the front rank of States. Her assessment-roll for 1880 shows a valuation of \$177,096,459.72, and for 1881, \$181,660,291.32. This is wrong and should be corrected. Such valuations do us no credit. When the property of this State is thoroughly assessed, even at two thirds of its value, it will show a valuation of quite \$300,000,000. The constitutional limit on taxation will then be more than sufficient. The tax rate can then be reduced, the State government sustained, and our State debt annually decreased. Confidence will be restored, our bonds will be on the market at a reasonable interest, commanding a premium; capital will rapidly find its way here, and we will no longer be humiliated at the low credit of our State."

The first act passed at the extra session, beginning December 5, 1881, is an appropriation of \$27,080 to defray its own expenses. The second and third acts authorize the State Treasurer to pay over the old balance belonging to the seminary fund to the Louisiana State University, and provides for repairs of the university buildings at Baton Rouge. The fourth act appropriates \$126,302.17 to complete the restoration of the Capitol at Baton Rouge. The fifth act makes appropriations for the ordinary expenses of the government, interest on the public debt, public schools, and public chari-

ties, for six months until July 1st. It provides for the salaries and other expenses of the executive and judiciary departments out of the general fund. It orders payment out of the interest tax fund of "reduced interest on coupons of consolidated bonds, under the provisions of the constitutional ordinance relative to the State debt, \$120,000, or as much thereof as may be necessary to pay the interest on that portion of the State debt already stamped or converted, and that which may be stamped prior to July 1, 1882." The sixth and last act of this session created a printing board.

Having ended by limitation of time without completing the revenue and license bills, a second extra session was called by the Governor, and commenced on the 26th of December. The Legislature now passed its third act providing for the investing of the interest tax fund in the hands of the fiscal agent of the State, in bonds of the United States Government, and providing for the payment of the reduced interest due or to become due on the bonds of the State.

The Constitution of 1879, it may be remembered, presented this alternative to the bondholders: either to retain the face of the bonds, the interest being reduced to 2 per cent, or to have the bonds reduced to seventy-five cents on the dollar, and receive 4 per cent on them. As the State debt amounts in round numbers to \$12,000,000, at 2 per cent interest, \$240,000 are required to pay the interest. If reduced to \$9,000,000 at 4 per cent interest, \$360,000 are necessary. As the rate of taxation at present is limited to one mill, and the assessed value of taxable property is \$181,000,000, only \$181,000 can be collected to pay the interest. A yearly deficit, which may vary from \$59,000 to \$179,000, must exist. The sole constitutional remedy for this lies in an increase of assessments. These are notoriously low. Neither of the extra sessions of this year met the vexed question to which their attention was directed in the Governor's message, and which the Constitution relegated to the Legislature. No board for the equalization of assessments is yet established, and the year closed with the Legislature still in session.

There was no serious civil or social disturbance during 1881. An organized strike occurred in New Orleans on the 1st of September, which interfered with commerce, and at one moment seemed to threaten the peace of the Commonwealth. The militia, at the request of the mayor, was called to protect the armories and assist the police in maintaining order. But an amicable compromise was effected between employers and employed, and on the 15th of September order was restored without a resort to force. There has been no exodus during the year, or any disturbed relations between the white and the colored populations.

The absence of general and municipal elections during the year has been favorable to tranquillity. The interruption of industry by

their frequent recurrence, and the distraction which they require from sober pursuits, are great evils. The fact is admitted that the people are the source of political power; that they govern through their appointed agents, who are responsible to them; but it is important that these facts should not be concomitant with idleness, dissipation, debauchery, and corruption, which seem to be consequents upon many elections in the States of the Union.

Nothing in the relations between Louisiana and her sister States is noteworthy, unless it be that the State of New York commenced a suit, in the Supreme Court of the United States, to recover \$1,050, the amount of thirty coupons detached from bonds issued by the State of Louisiana in 1874. In the year 1878 a bill was passed through the Legislature of New York to authorize any citizen to transfer an overdue written obligation of any other State to the State of New York, and that, upon being secured in the payment of costs and expenses of the suit, her Attorney-General should bring suit for its collection. This bill did not meet the approbation of the Governor, and was defeated. The veto of Governor Robinson was emphatic, and his message is worthy of preservation:

STATE OF NEW YORK, EXECUTIVE CHAMBER, }
ALBANY, June 14, 1878. }

Memorandum in brief of the reasons for disapproving Senate Bill No. 292, entitled "An act to protect the rights of citizens of this State holding claims against other States."

The Constitution of the United States does not permit a citizen to sue a State in the United States courts. This bill attempts to evade that provision by authorizing a citizen of this State, holding any obligations of other States, to assign his claims to the State, and to be prosecuted in the name of the State by the Attorney-General for the benefit of the individual. In other words, it requires the State to lay down its dignity, its honor, and its integrity as a sovereign State of the Union, and to become a collecting agent for speculators in State bonds, or written obligations against other States, and in so doing to evade the Constitution, and to assume a false position by prosecuting claims in which it has no interest whatever.

(Signed) L. ROBINSON.

An act with the same title was introduced the following year into the General Court of New Hampshire, and adopted. In 1880 the Legislature of New York passed the former act, and there was no veto. It is under this last act that the suit of New York was commenced in April last. In 1881 a bill under this same title was introduced into the Legislature of Massachusetts, but that Commonwealth rejected it. These suits are pending in the Supreme Court of the United States. The Constitution of the United States has jurisdiction to determine controversies between the States. The controversies heretofore determined have related to subjects of jurisdiction and boundary, which disturbed the colonies, and were inherited by the States. The question which will be decided by the Supreme Court is presented in a very forcible manner in the above-cited message of Governor Robinson.

These suits exhibit the fact that the finances

This year has been free from any continuance of the exodus. The principal subjects of anxiety arose out of the vicissitudes of the climate. In January the weather was unusually severe, especially in Southern Louisiana. The prospects of the orange-crop were destroyed. The sugar-crop was much injured. It will not probably reach beyond half that of the previous season. During the year ending September 9, 1881, 278,000,000 pounds of sugar were raised in Louisiana, of which 174,644 hogsheads and 47,435 barrels reached the port of New Orleans, together with 272,962 barrels of molasses. There are 1,144 sugar-houses in the State,

The tobacco receipts reached 11,584 hogsheads, of which 9,527 were exported. The cultivation of a species of tobacco of peculiarly fine flavor, known as *Perique*, is gradually dying out. The *Perique* tobacco-plant is indigenous and confined to a small district in St. James Parish, three miles from the Mississippi River and about fifty-five miles above New Orleans. It is a French settlement, wholly given to this one culture. All efforts to produce it elsewhere have failed. The leaves are plucked from the stem and never permitted to dry. After four months of careful manipulation it is fitted for market. No foreign substances are used in its preparation; it owes its flavor to its intrinsic qualities and to that particular soil. The press used is of the most primitive construction. The tobacco is made up into rolls, or "carrots," of about four pounds each. There are three grades, the finest of which is consumed by the planters themselves; the next quality is employed by cigarette-makers. The revenue paid on it is sixty-three and a half cents a pound, in lieu of sixteen cents on other tobaccos which are not stemmed like *Perique*. In consequence of these exactions the product is declining. Nineteen planters have abandoned it, and there are only sixteen engaged in what was once a lucrative business. A bill was introduced into Congress permitting the transportation of *Perique* in bond. It failed, probably from the small influence brought to bear in its favor. Unless some similar measure revive it, *Perique* will soon be a thing of the past. The last crop only reached 10,000 "carrots," or 40,000 pounds. The fostering of small industries and the development of many minor cultures, instead of the absorption of all endeavor in the great staples, would enhance the prosperity of Louisiana. For instance, in the neighborhood of Natchitoches the truffie is indigenous, and might become a source of profit. Madder grows luxuriantly. Cochineal-culture might well be made profitable where the aloe flourishes as it does in lower Louisiana. The soil is too spongy

for the olive, which loves the driest hill-sides. The cotton-seed produces an oil which is manufactured to a large extent in New Orleans. Refined, it compares well with olive-oil in flavor, and is exported to Europe in large quantities and employed to adulterate olive-oil. During the past year a process has been invented by which it can be manufactured into a species of vegetable butter. The *Morus multicaulis*, the mulberry-tree on which the silk-worm thrives, grows in Louisiana, and during the year much attention has been paid to the breeding of the worms, with a view to engaging in silk-culture.

The State has not suffered from any pestilential diseases. The temperature during the summer, though high, was uniform. It is the rapid vicissitudes of heat and cold, moisture and dryness, apparently, which give support to pestilence and propagate climatic disorders.

Commerce, relieved of this check, has flourished. The imports, during the fiscal year ending September 1st, amounted to \$12,413,270, against \$10,915,042 for the preceding twelve-month. The exports reached \$104,150,450, against \$93,335,880 for 1879-'80.

The jetties maintain their complete success. A recent survey shows that the shallowest spot in the channel gives a depth of twenty-six and a half feet, while between the jetties themselves there is nothing shoaler than thirty feet.

The principal feature in the annals of this year is the railroad development. The connection between New Orleans and the Pacific Ocean has been perfected. The last spike needed was driven at Blanco Peak, about ninety miles east of El Paso, on the 1st day of December, at an altitude of some five thousand feet above the city of New Orleans. The Texas Pacific began at Fort Worth, and five hundred and twenty-one miles were built in five hundred and twenty-one days, uniting with the Southern Pacific at Blanco Junction.

What is known as the Erlanger Syndicate

have made their arrangements to enter New Orleans. This line of railroad will connect the city directly with Cincinnati. The line of railroad extends from New Orleans to Meridian in Mississippi, and thence through Tuscaloosa, Birmingham, and Chattanooga. This connection is new, and the traversing of so wide a lake as Maurepas by a railroad is deemed a feat in engineering. This syndicate is completing the connections of Shreveport and Vicksburg, and these with Savannah and Brunswick. The completion of the railroads into Texas brings New Orleans in connection with the Nueces and into prospective connection with Tampico and the city of Mexico.

According to the census of 1880, Louisiana is the twenty-second State in population in the Union. It numbers 939,946 souls. The city of New Orleans has a population of 216,140. It is generally conceded that this is an underestimate, the census having been taken in June of the summer succeeding the epidemic of 1879, when there was a large absenteeism due to the possibility of a recurrence of the scourge.

The negro population shows a more rapid increase than the white in all the Southern States, Alabama alone excepted. In Louisiana the census shows a gain of 26 per cent in the whites, while 33 per cent is the negro gain.

The public schools in Louisiana suffer from irregularity in payments, and throughout the country parishes from the sparseness of population, who live on distinct plantations, and are not often gathered into considerable villages and towns. The city of New Orleans was divided into three public-school districts, each with a separate board of directors, at the time of its consolidation. Two hundred thousand dollars are annually appropriated by the city for the support of these schools. From 1874 to 1882 the city was in arrears \$481,719.70.

The following statement shows the population of the State, by parishes, in 1880 and 1870:

LUTHERANS. The following is a summary of the statistics of the synods and the general bodies of the Evangelical Lutheran Church in

the United States, as given in the "Lutherische Kalender" of Brobst & Diehl, Allentown, Pennsylvania, for 1882:

SYNODS.	Prech- ers.	Congre- gations.	Communi- cants.
GENERAL COUNCIL.			
1. Ministerium of Pennsylvania	202	894	85,690
2. Ministerium of New York	70	86	25,924
16. Pittsburg Synod.	74	142	12,876
25. Synod of Texas.	80	37	5,838
32. Evangelical Lutheran District Synod of Ohio.	81	61	6,419
34. Swedish Augustana Synod.	147	382	41,976
36. Michigan Synod.	25	49	5,464
38. Canada Synod.	25	60	7,000
39. Holston Synod.	13	25	1,513
49. Indiana Synod.	14	28	2,106
	631	1,214	194,636
Not yet officially connected with the General Council:			
23. German Synod of Iowa.	161	270	25,000
35. Norwegian Augustana Synod.	22	53	7,000
	814	1,537	223,656
SYNODICAL CONFERENCE.			
20. Joint Synod of Missouri and other States.	739	970	154,522
23. Synod of Wisconsin.	97	159	26,219
26. Norwegian Synod.	132	503	69,420
37. Synod of Minnesota.	30	62	6,026
56. English Evangelical Lutheran Conference of Missouri.	7	8	400
	1,055	1,792	256,587
GENERAL SYNOD, SOUTH.			
3. Synod of North Carolina.	25	49	4,725
7. Synod of South Carolina.	86	52	5,566
9. Synod of Virginia.	30	55	4,150
15. Synod of Southwest Virginia.	23	44	2,557
31. Mississippi Synod.	6	9	865
40. Synod of Georgia.	8	13	1,100
	123	222	18,463
GENERAL SYNOD.			
5. Synod of Maryland.	63	103	12,614
8. Synod of West Pennsylvania.	64	112	13,290
10. Hartwick Synod.	29	32	4,056
11. East Ohio Synod.	42	70	5,000
12. Franckean Synod.	24	35	2,874
13. Alleghany Synod.	63	141	12,560
14. East Pennsylvania Synod.	72	112	13,997
17. Miami Synod.	28	37	3,406
21. Wittenberg Synod.	33	64	6,200
22. Olive Branch Synod.	19	25	1,701
24. Synod of Northern Illinois.	33	41	2,129
27. Synod of Central Pennsylvania.	37	73	7,140
29. Synod of Iowa (English).	25	81	1,279
30. Synod of Northern Indiana.	41	73	3,550
33. Synod of Southern Illinois.	10	13	1,015
41. Central Illinois Synod.	28	82	1,335
42. Synod of N. York and N. Jersey.	51	39	6,193
43. Susquehanna Synod.	32	65	6,963
44. Pittsburg Synod.	29	54	4,435
46. Kansas Synod.	33	81	1,042
48. Nebraska Synod.	25	32	1,747
54. German Warburg Synod.	37	43	5,600
57. Middle Tennessee Synod.	14	15	1,056
	847	1,233	124,734
INDEPENDENT SYNODS.			
4. Joint Synod of Ohio and other States *.	197	312	47,550
6. Tennessee Synod.	25	80	7,831
13. Buffalo Synod (Grabau's).	19	22	3,200
45. Hauge's Norwegian Ev. Luth. Sy.	22	80	6,000
47. Conference of Norwegian Danish Lutheran Church.	63	330	21,261
50. Danish Ev. Luth. Ch. in America.	22	70	4,000
51. Swedish Ev. Luth. Ansgar Synod.	31	45	1,200
52. Augsburg Synod.	13	20	3,030
53. Immanuel Synod.	5	8	1,350
55. German Evan. Lutheran Synod of Maryland.	8	..	1,420
Pastors unconnected with a synod.	43	50	15,000
	455	1,026	111,862
Total for the whole Lutheran Church in America.	3,299	5,865	783,302

* Withdrew from the Synodical Conference in September, 1881.

Increase during the year, 125 pastors, 182 congregations, and 37,884 communicants.

The "Kalender" enumerates as belonging to or connected with the several branches of the Lutheran Church, 20 theological seminaries, 16 colleges, 23 seminaries and academies, 14 seminaries for young women, 33 benevolent institutions (for orphans, the infirm, sick, and immigrants), and 78 periodical publications, of which 28 are in the German, 26 in the English, 6 in the Swedish, and 18 in the Norwegian and Danish languages. The General Council and the General Synod have each a committee of foreign missions and a committee of home missions; the Missouri Synod has a freedmen's mission, and the Swedish Augustana Synod has a mission among the Indians.

The growth of the Lutheran Church in the United States has been very rapid, in consequence of the accessions by immigration. In 1823 there were returned 178 pastors and 900 congregations; in 1845, 22 synods, 538 pastors, 1,307 congregations, and 135,629 communicants; in 1860, 36 synods, 1,193 pastors, 2,279 congregations, and 232,780 communicants; in 1865, 42 synods, 1,559 pastors, 2,825 congregations, and 310,677 communicants; in 1870, 48 synods, 2,016 pastors, 3,330 congregations, and 396,567 communicants; in 1875, 53 synods, 2,546 pastors, 4,559 congregations, and 559,119 communicants; and in 1880, 58 synods, 3,087 pastors, 5,376 congregations, and 689,195 communicants.

The thirtieth biennial convention of the *General Synod* met at Altoona, Pennsylvania, June 8th. Delegates were present from twenty-two synods, leaving two synods unrepresented. Professor Charles A. Hay, D.D., of Gettysburg, Pennsylvania, was chosen president. The attention of the synod was given principally to the consideration of the interests of its benevolent enterprises and boards. The *Board of Church Extension* reported that its receipts for two years had been \$20,901, of which \$6,097 had been received for general funds and \$14,804 in the form of special gifts. Recommendations that permission be no more granted to congregations to appeal to the churches for their own behalf except through the board, and that all funds contributed for church extension be paid to the treasury of the board and adopted by it, were approved by the synod. The *Board of Publication* had received from sales during two years and nine months, \$98,822; it was out of debt, and was possessed of assets having a net value of \$47,751. The *Theological Seminary* at Gettysburg, Pennsylvania, had a productive endowment of \$80,000, yielding a revenue of from three to four per cent, with an unproductive endowment of \$20,000, and reported thirty-seven students in its classes. The synod decided to establish without unnecessary delay an institution for exclusively German theological education, to be situated for the present at Carthage, Illinois, and to be under the control of a board of directors ap-

pointed by the General Synod and by such district synods as may unite in its support. The curator of the *Lutheran Historical Society* reported that a number of valuable books and papers had been received by that institution. The receipts of the *Board of Home Missions* for two years had been \$27,035. It had conducted sixty-five missions in different parts of the United States, in which 1,093 accessions were reported, and which had contributed \$82,208 toward their own support and to the funds of the church. Eight of the missions had become self-sustaining and two had been discontinued. The synod decided that the sum of \$25,000 should be raised annually for home missions and \$15,000 for church extension. A board of seven persons was appointed to represent the synod in the work of the Emigrant Mission at Castle Garden, New York. The Orphans' Home at Loysville, Pennsylvania, had received \$11,397, and had fifty church orphans and sixty-three soldiers' orphans in charge. The *Board of Foreign Missions* reported that its receipts from May 31, 1879, to March 31, 1881, had been \$32,014, and its expenditures \$29,782. The Woman's Missionary Societies had paid \$1,506 and the Children's Foreign Missionary Societies \$2,837 into its treasury. The board asked for \$20,000 a year for the next two years. The missions were at Mullenburg, West Africa, and Guntoor, India. The committee on the *Liturgy* reported that the book was printed and ready for distribution. A committee was appointed to ascertain whether an agreement could be made with the General Synod South concerning a common hymn-book for the use of the two bodies. A measure designed to secure more complete statistical returns was passed, requiring each district synod to present to the General Synod for publication in the minutes a biennial parochial table of its operations, and ordering a summary of all such tables to be made by the Secretary of the General Synod. A fraternal delegate from the General Assembly of the Cumberland Presbyterian Church, presenting the greetings of that body, communicated an overture from it, proposing the mutual appointment of committees to consider the subject of a closer union between the two churches. The synod decided to appoint a standing committee to consider the subject and confer upon it with the Cumberland Presbyterian General Assembly. Reports were presented showing that the General Synod was in correspondence with nearly every evangelical religious body in the United States, and that fraternal delegates of those bodies had reported to it either in person or by letter.

The second biennial convention of the *Woman's Home and Foreign Missionary Society* connected with the General Synod was held at Altoona, Pennsylvania, April 7th. The society had received \$7,069 in two years. It helped support traveling missionaries in the West, sustained a home mission at Freeport, Illinois, maintained six girls' schools, a female mission-

ary and a *zenana* worker in India, and was building a house for its agents in that country.

The *General Council* met at Rochester, New York, in October. The Rev. Dr. A. Spaeth, of Philadelphia, was chosen president. Reports were presented on home missions, the Emigrant Mission in the port of New York, and foreign missions. The *Executive Committee of Home Missions* reported that it was indebted to the amount of \$2,337. One missionary and an asylum for emigrants were connected with the Emigrant Mission in New York. The missionary was accustomed to hold daily service in the chapel of the house, and cared for the emigrants from the time they landed till they were comfortably provided for. Nine thousand two hundred and twenty-seven persons had thus been taken care of during the year. The receipts for the Home or asylum had been \$12,710; it was still in debt to the amount of \$15,000. The receipts for the *Foreign Mission* had been \$7,670, and the expenses \$6,915. The mission, which was assumed by the General Council in 1869, is in and about Rajahmundry, along the Godavery River in India. Four missionaries had been sent out, and two natives who had been ordained three years previously had been educated so as to be able to act as missionaries. Five hundred and thirty-six persons had been baptized, and the mission included at present 216 communicants, 12 vernacular schools, 1 English, and 1 Teloo-goo Sunday-school.

The subject of appointing a special day of fasting and prayer, which had been considered by the Council for several years, was brought up again, and was disposed of by naming Ash-Wednesday as the day. The condition of the *Home Missions* was actively discussed. A proposition was made to reconsider the action of the previous year assigning the care of the several missions of this class to different synods, and to commit the whole work to the executive committee. An appeal was made by the friends of the synodal system to give it a longer trial, and it was unanimously continued for the ensuing year. A German committee was appointed for the German mission-work, and was instructed to consider whether it would be better to apply to a foreign institution for men qualified to labor as missionaries, or to organize an institution at home for the education of such men. The appointment of a special Swedish committee to look after the Swedish home missions having been recommended, the Central Committee of the Swedish Augustana Synod was constituted the Committee of the General Council. The Committee on the Emigrant Mission was instructed to confer with the same committee with regard to the appointment of a Swedish missionary for that station. The Council continued the discussion which it has carried on for several years of the one hundred theses on fellowship which had been prepared at its request by the Rev. C. P. Krauth. These theses were intended to elucidate the so-called

"Galesburg Rule"—"Lutheran pulpits for Lutheran ministers only; Lutheran altars for Lutheran communicants only." The ninety-seventh to the ninety-ninth theses, involving the doctrinal discussion of the relation of the visible to the invisible church, were taken up. They are as follows:

The tokens of an invisible church are invisible tokens, and can therefore only justify an invisible recognition. The communion of an invisible church must, as such, be an invisible communion. "The communion of saints" pertains to the invisible church, and is therefore not a visible communion. It is taught in the creed; it is an article of faith, and can not therefore be an object of vision. It is neither made nor necessarily marked by going into one pulpit or coming to one altar. Men may have both in communion without being in the "communion of saints," and be in that communion without a common pulpit or altar.

The church visible may be considered in the wider and in the stricter sense of the term. The wider sense considers it with reference to the essentials of its simple existence; the stricter sense with reference to its rightful existence in conformity throughout with the divine idea and command. Wherever men may be born to God and divinely nurtured, either through the whole faith they confess, or in spite of parts of it, there is the church visible in its widest sense. The visible church, taking the term in its strictest sense, has its visible tokens, to wit, the official acceptance and confession of the word in its totality, in its pure and free sense, and the use of the right sacraments in their divine essentials. Wherever men are born to God and divinely nurtured, through the whole faith and sacraments confessed and used, and in no respect in spite of parts of that faith and usage, there is the church visible in the stricter sense, the pure church visible; or with the understanding implied, that the limitation is to the normal and unreservedly right there is the church visible. All Christian bodies, not self-confessed sects or sectisms, claim of necessity to be the visible church in the stricter sense. Not to claim it is a confession of heresy or schism. We are Lutherans because we believe that our church justly claims that her faith is in every part scriptural. She of necessity holds that all claims inconsistent with this are untenable. Our church exists of right, and we are in her fellowship of right, only because she is unreservedly the visible church by an unreserved confession of the whole truth.

The difference which underlies the distinction between the terms visible and invisible was brought out, in the discussion, to be:

The visible church is where the Word of God is taught, and the sacraments are administered in accordance with it; the invisible church is the communion of all true believers in Christ. Ordinarily, the latter is contained in the former, and becomes possible by it. Where word and sacraments are wanting, no Christian church is possible; wherever that word is found, and be there ever so little of its essentials, there is the church visible. Where that word is taught in its purity, there is the true visible church. There is no invisible church possible without the visible church, because God has revealed only this one way of salvation—to wit, his Word. Wherever, therefore, that word is preached, there alone believers are possible, and the invisible church.

The doctrine of the relation of the congregation to the synod was designated as the subject of the doctrinal discussion for the next year.

The *Synodical Conference* has suffered a

division on a question of a definition of doctrine. The joint Synod of Missouri, the largest and most influential synodical member of the body, at its meeting in 1881, approved a series of thirteen theses respecting the doctrine of predestination, which had been prepared by Professor C. F. Walther, of the Theological Faculty at St. Louis, but which were regarded by many persons in the other synods of the Conference as setting forth Calvinistic, and therefore un-Lutheran doctrines. The theses declare a belief and confession that God loved the world from the beginning, that he made all men to be saved and none to be damned, and that he wills the salvation of all; that the Son of God came into the world for the sins of all men; that he has borne the sins of all men and atoned for all, without exception, and has wrought complete redemption; that only true believers, who truly believe to the end of life, are the subjects of the election of grace or predestination; that the divine decree of election is unchangeable, and that, therefore, none of the elect can be rejected or lost, but that all the elect are truly saved; that it is foolish and perilous to the soul, leading it either to carnal security or to despair, when one endeavors to become sure of his election or final and eternal salvation, by penetrating the eternal and secret decrees of God; that a believing Christian should seek to become assured of his election from the clearly revealed will of God; that election does not consist in the mere foreknowledge of God that certain persons will be saved; that it is not his mere determination to redeem and save mankind, whereby it becomes general and extends to all men; that it does not embrace those who believe only for a time (Luke viii, 13); and that it is not simply a decree of God to save all those who shall believe to the end; that the grace of God and the merit of Jesus Christ alone are the cause which moved God to choose the elect, and not any good, not even the faith which he foresaw in them; that election is not a mere foreseeing and foreknowing of the salvation of the elect, but is also a cause of their salvation, and of all that belongs to it. The substance of the doctrines thus expressed had been much discussed after the theses were published by Professor Walther, in the press, in a pastoral conference held at Chicago, Illinois, and in a colloquium at Milwaukee, Wisconsin, which was attended by the faculties of the theological seminaries and the presidents of the synods embraced in the Synodical Conference. Having approved the doctrines, the Joint Synod of Missouri instructed its delegates not to sit with such men "as have publicly decried us as Calvinists"; and not to recognize any synod as being a member of the Synodical Conference "that as such has made that charge against us."

The subject was the especial object of consideration at the meeting of the Joint Synod of Ohio, which was held at Wheeling, West Virginia, September 8th. This body adopted,

by a majority of more than two thirds, a declaration of its doctrinal position on the subject as follows:

We again herewith confess the doctrine of election as it is contained in the formula of Concord, and also as it has, in accordance therewith, been always taught on the whole, by the great teachers of our church. Especially do we hold the doctrine of our fathers, that the ordination of the elect to eternal life took place in view of faith, i. e., in view of the merits of Christ appropriated by faith, to be in accord with the Scriptures and our Confessions; therefore, *Resolved*, that in the future, as in the past, the doctrines here anew confessed be alone authorized in our institutions, schools, publications, and churches.

The synod resolved to withdraw from the Synodical Conference, and replied to the protests of members against its action—or rather to those protests which were based upon fundamental points rather than merely directed

against the expediency of its course—with a declaration that “those members of the synod who not only protest against the action and position of the synod, but feel themselves bound in conscience to oppose the doctrinal position of the synod, can not remain among us as brethren.”

A free conference, representing the various Norwegian Lutheran Synods, was held at St. Ansgar, Iowa, in July, to consider measures for bringing those bodies together into one united Norwegian Lutheran Conference or Council. Four synods were represented by three hundred and forty-one delegates. The doctrines of redemption and forgiveness of sins were discussed, and the points of difference existing in the bodies were ascertained; after which the Conference adjourned, without taking definite action, till 1883.

M

MACKENZIE, ROBERT SHELTON, M. D., LL. D., D. C. L., born at Drews Court, County Limerick, Ireland, June 22, 1809; died in Philadelphia, November 30, 1880. He was the second son of Captain Kenneth Mackenzie, the author of a volume of Gaelic poetry. After his education at Fermoy, he studied medicine at Cork, and graduated at Dublin, but never practiced his profession. From his eighteenth year he was devoted to literature, and edited various newspapers in England until 1845, when he became London secretary of a railroad company, which position he retained until 1851. Meantime, while contributing to leading English periodicals, he had established a literary connection in America, writing for several journals, and furnishing a weekly letter to the New York “Evening Star” from 1834 until that paper ceased publication. Mr. Mackenzie was the first salaried correspondent of the American press. Between 1828 and 1850 he published several works, including “Lays of Palestine,” in 1828; “Titian, a Venetian Art Novel,” in 1843; a “Life of Guizot” (prefixed to a translation of “Democracy and its Mission”), in 1846; “Partnership en Commandite,” a legal commercial book, in 1847; and “Mornings at Matlock,” a collection of stories, in 1850. He was also engaged with others in the preparation of various works, and accomplished a large amount of editorial writing. In 1834 he received the degree of LL. D. from Glasgow University, and ten years later was made a D. C. L. by Oxford. Dr. Mackenzie came to America in 1852, settling first in New York, and removing to Philadelphia in 1857. Here his literary life was busy and productive, and he enjoyed the friendship of many prominent politicians and men of letters. For a long time he was associated with the Philadelphia “Press,” giving his attention mainly to foreign literary matters. Of his more per-

manent work, his admirable edition of the “*Noctes Ambrosianæ*” is perhaps the most notable. He edited, with copious notes and original biographies of the authors, Sheil’s “Sketches of the Irish Bar,” De Quincey’s “Klesterheim,” a “Life of Curran,” Lady Morgan’s “O’Briens and O’Flaherties,” and Dr. Maginn’s miscellaneous works. He also published several original works, and was remarkable for his memory of dates, events, and persons. His notes as a book editor were marked by great accuracy, and were esteemed very valuable.

MAINE. The presidential vote in 1880 was as follows: for the Garfield electors, 74,039; Hancock electors, 65,171; Weaver electors, 4,408; Dow, 93. The Hancock vote was cast for a fusion ticket containing four Greenbackers and three Democrats. There was no general election in 1881. On the 12th of September a special election was held in the second congressional district to fill the vacancy caused by the resignation of Mr. Frye. Nelson Dingley, Jr., Republican candidate, was elected by a vote of 10,960 against 5,519 for Gilbert, Greenbacker, and 295 for all others. The Legislature met on the 5th of January, and adjourned on the 18th of March. This body is constituted as follows: Senate, 22 Republicans, 5 Greenbackers, 3 Democrats, and 1 Independent; House, 86 Republicans, 33 Greenbackers, and 32 Democrats. On the 6th of January the following State officers were elected in joint convention: Joseph O. Smith, Secretary of State; Henry B. Cleaves, Attorney-General; George L. Beal, Adjutant-General; and Roscoe L. Bowers, Frederick Robie, Joseph T. Hinkley, William Wilson, James G. Pendleton, Lewis Barker, and Samuel N. Cambell, Councilors. These are all Republicans, and all were re-elections, except in the case of the Secretary of State. On the 2d of February S. A. Hol-

brook was elected State Treasurer. The election of United States Senator took place on the 18th of January. Eugene Hale, Republican, was chosen by a vote of 22 in the Senate against 8 for Joseph L. Smith, and 1 for Harris M. Plaisted, and of 83 in the House against 64 cast for Smith. On the 15th of March Congressman William P. Frye was elected United States Senator to fill the vacancy caused by the resignation of Mr. Blaine, appointed Secretary of State in President Garfield's Cabinet.

Acts were passed at this session, making women eligible to the offices of supervisor of schools and superintending school committees, and regulating the practice in equity proceedings.

Other important enactments were—an act concerning the care of abused and neglected children; an act authorizing the improvement of marshes, meadows, and swamps; an act concerning public parks and squares; and an act for the promotion of medical science. An act relative to the manufacture and sale of vinegar is as follows:

SECTION 1. Whoever manufactures for sale, or knowingly offers or exposes for sale, or knowingly causes to be branded or marked as cider-vinegar, any vinegar not the legitimate product of pure apple-juice, known as apple-cider, and not made exclusively of said apple-cider, but into which any foreign substances, ingredients, drugs, or acids have been introduced, as shall appear by proper tests, shall, for each such offense, be punished by a fine of not less than fifty nor more than one hundred dollars.

SEC. 2. Whoever manufactures for sale, or knowingly offers or exposes for sale, any vinegar found, upon proper tests, to contain any preparation of lead, copper, sulphuric acid, or other ingredient injurious to health, shall, for each such offense, be punished by a fine of not less than one hundred dollars.

SEC. 3. The mayor and aldermen of cities shall, and the selectmen of towns may, annually appoint one or more persons to be inspectors of vinegar, for their respective places, who shall, before entering upon their duties, be sworn to the faithful discharge of the same.

An act relating to admissions to the bar provides:

SECTION 1. No person who has not been a member of the bar of another State, in good standing and in active practice, for at least three years, shall be admitted to practice law in the courts of this State, unless he shall have studied for at least two years in the office of some attorney-at-law, or part of the time in such office, and the remainder in some law-school, and shall also have passed a satisfactory examination in his legal studies.

SEC. 2. All examinations shall be public, and in the presence of some justice of the Supreme judicial court during term-time. The time for holding the same in each county, not exceeding twice in each year, shall be fixed by the Chief-Justice. The examination shall be partly oral and partly written, and shall be conducted by an examining committee of the bar, in each county, to be appointed by the Chief-Justice.

The principal provisions of an act for the better protection of life in buildings used for public purposes are as follows:

SECTION 1. Any church, theatre, hall, or other building or structure intended to be used temporarily or permanently for any public purpose, or any school-house or school-room, public or private, hereafter con-

structed, shall have all inner doors intended to be used for egress therefrom open outward.

SEC. 2. All outer doors of buildings or structures of the kind mentioned in section 1 of this act, constructed or hereafter to be constructed, shall be kept open when such buildings or structures are used by the public, unless such doors open outward, and except that fly-doors opening both ways may be kept closed.

SEC. 3. All hotels used for the accommodation of the public, and all shops, mills, factories, and other buildings, more than two stories in height, in which any trade, manufacture, or business is carried on, which requires the presence of workmen or other persons in any part of the building above the first story, shall be provided with such suitable and sufficient fire-escapes, outside stairs or ladders, as the municipal officers shall deem to be sufficient to afford safe and easy escape from the building in case of fire; and such fire-escapes or ladders shall be attached to the building or be stored outside of such building, and convenient thereto, as the municipal officers shall direct, and shall be of such length and number as said officers shall approve.

An act relating to the transportation of passengers and freight by railroad contains the following provisions:

SECTION 1. . . . No railroad doing business within this State shall demand or receive of any other railroad doing business within the same, whether making direct connection or not, or from passengers over the same, or from freight forwarded over the same, higher rates of fare or freight than it demands or receives of any other railroad within the State.

SEC. 2. No rebate, drawback, allowance, or other advantage shall be made or extended by any railroad in favor of another railroad doing business over the same, by which the operation of the foregoing section shall be changed or affected, or by which one railroad doing business over the same shall receive any greater advantage than any other railroad, doing business over the same, shall receive.

SEC. 3. Any railroad company chartered under the laws of this State, which shall refuse to receive, transport, or deliver any freight, merchandise, or passengers, according to the provisions of this act, and under the terms thereof, or which shall demand or receive from any other railroad in this State, for the transportation of its passengers or freight, any sum in excess or violation of said provisions, shall, for each offense, forfeit and pay any corporation injured, the sum of one hundred dollars, to be recovered by an action on the case in any county in which any of the parties in such action has a residence or place of business.

An act was also passed for the taxation of railroads, the essential portions of which are as follows:

SECTION 1. The buildings of every railroad corporation or association, whether within or without the located right of way, and its lands and fixtures outside of its located right of way, shall be subject to taxation by the several cities and towns in which such buildings, land, and fixtures may be situated, as other property is taxed therein.

SEC. 2. Every corporation, person, or association operating any railroad in this State, shall pay to the State Treasurer, for the use of the State, an annual excise tax, for the privilege of exercising its franchises in this State, which, with the tax provided for in section 1, shall be in lieu of all taxes upon such railroad, its property and stock. There shall be apportioned and paid by the State from the taxes received under the provisions of this act, to the several cities and towns in which, on the first day of April in each year, is held railroad stock hereby exempted from other taxation, such amount equal to one per

centum on the value of such stock on that day, as determined by the Governor and Council: *Provided, however,* That the total amount thus apportioned on account of any railroad shall not exceed the sum received by the State as tax on account of such railroad.

Sec. 3. The amount of such tax shall be ascertained as follows: The amount of the gross transportation receipts as returned to the Railroad Commissioners for the year ending on the thirtieth day of September next preceeding the levying of such tax, shall be divided by the number of miles of railroad operated to ascertain the average gross receipts per mile; when such average receipts per mile shall not exceed twenty-two hundred and fifty dollars, the tax shall be equal to one quarter of one per centum of the gross transportation receipts; when the average receipts per mile exceed twenty-two hundred and fifty dollars and do not exceed three thousand dollars, the tax shall be equal to one half of one per centum of the gross receipts; and so on, increasing the rate of the tax one quarter of one per centum for each additional seven hundred and fifty dollars of average gross receipts per mile or fractional part thereof, provided the rate shall in no event exceed three and one quarter per centum. When a railroad lies partly within and partly without this State, or is operated as a part of a line or system extending beyond this State, the tax shall be equal to the same proportion of the gross receipts in this State, as herein provided, and its amount determined as follows: the gross transportation receipts of such railroad, line, or system, as the case may be, over its whole extent, within and without the State, shall be divided by the total number of miles operated to obtain the average gross receipts per mile, and the gross receipts in this State shall be taken to be the average gross receipts per mile, multiplied by the number of miles operated within this State.

The following resolve, amendatory of a former resolve, relating to the Penobscot Indians, was adopted:

Resolved, That the Penobscot tribe of Indians hereafter be allowed to elect by ballot their governor, lieutenant-governor, and representatives to the Legislature, on the second Tuesday of September, biennially, and that the old and new party, so called, be allowed to select from their respective parties candidates for said offices, alternately, commencing with the old party, for the year eighteen hundred and sixty-seven, and the new party shall have no voice in the selection of candidates for said offices, and shall not vote in their election, in those years when the old party is entitled to them; and the old party shall have no voice in the selection of candidates for said offices, and no vote in their election, in those years when the new party is entitled to them; and it shall be the duty of the agent to preside at such election.

The relations of the Governor with the Council during the year were not harmonious. The differences related partly to appointments to office, but the chief disagreement was on the question whether the power of removal is vested in the Governor alone, or rests with the Governor by and with the consent of the Council. The Governor sought to remove the reporter of decisions in March. His power was questioned, and the opinion of the justices of the Supreme Court was asked. In December their unanimous opinion was given against the claim of the Governor. The following exhibits the financial condition of the State:

RECEIPTS.

Total receipts for the year 1881.....	\$1,417,526 83
Cash in the Treasury, January 1, 1881.....	160,383 64
Total.....	\$1,577,910 47

EXPENDITURES.

Total expenditures for the year 1881..	\$1,435,460 21
Cash in the Treasury, December 31, 1881.....	142,405 26
Total.....	\$1,577,865 47

There was paid on the public debt, \$83,000; for interest on the same, \$336,681. The payroll of the House was \$28,159. For printing there was paid \$12,609.39; binding and stitching, \$5,490.80; insane State beneficiaries, \$38,109.49; to deaf, dumb, and blind, \$13,468.01; to the Reform School was given \$13,000; and to the State Prison, \$43,289.62. Soldiers' pensions amounted to \$17,843.50; expenses for military purposes to \$15,852.14. To free high-schools was paid \$16,256.05; to school fund, No. 47, \$84,213.18; to the school mill-tax, No. 9, \$210,591.80; to normal schools, \$18,353.62. The amount paid the temporary loan was \$200,000.

Following is an exhibit of the condition of the sinking fund:

CREDIT.

By balance of fund, January 1, 1881, as per last report.....	\$1,307,857 75
Receipts during the year from taxation.....	80,479 95
Receipts, State of Maine 4 per cent bonds, due August 1, 1881.....	25,000 00
Receipts, for interest.....	66,544 40
Total.....	\$1,479,882 10

DEBIT.

To investment of bonds due.....	\$25,000 00
Paid premium on bonds purchased.....	17,185 63
Paid for accrued interest.....	1,843 98
Paid for commissions.....	35 25
Balance, December 31, 1881, invested as per schedule annexed.....	1,436,367 29
Total.....	\$1,479,882 10
U. S. registered and coupon 4 per cent bonds..	\$206,000 00
" " 3½ per cent bonds.....	30,500 00
" " 4½ " 	55,000 00
N. H. registered and coupon 6 per cent bonds..	65,700 00
" " 5 per cent bonds.....	22,000 00
State of Maine registered 4 per cent bonds.....	182,000 00
" " 6 " 	869,000 00
" " coupon 6 " 	4,300 00
Certificates of Governor and Council for lost bonds.....	600 00
Cash and checks on Suffolk National Bank.....	51,267 29
Total.....	\$1,436,367 29

Some of the estimated expenditures for 1882 are—for public debt, \$53,000; for interest thereon, \$345,000; for the school fund and mill-tax, \$327,978.71; for normal schools, \$19,000; for free high-schools, \$26,000; for salaries of public officers, \$53,000; for insane State beneficiaries, \$40,000; for the deaf, dumb, and blind, \$13,500; for soldiers' pensions, \$22,000; for military purposes, \$16,000. The total estimated expenditures are \$1,247,835.90; the total estimated receipts, \$1,467,185.05.

The resources of the State, January 1, 1882, were, cash in the Treasury, \$142,405.26; due on State taxes, \$1,005,029.79; sinking fund, \$1,436,367.29; total, \$2,583,802.34. The liabilities of the State, January 1, 1882, were \$8,588,600.25. The bonded debt of the State, after deducting the sinking fund, is \$4,365,533.

The land agent paid into the Treasury during the year the sum of \$5,314.21, viz.: Septem-

ber 21st, \$3,000, and November 11th, \$1,470.74, on account of the permanent school fund, and on November 30th, \$843.47, on account of lands reserved for public uses.

The disbursements of the State College amounted to \$16,815.14; total receipts, \$18,401.42; the resources of the college amount to \$131,161.38. The total number of graduates is 156, besides whom nearly 200 students have been connected with the institution for a greater or less length of time.

There are now 181 prisoners in the State Prison. The total number of convicts convicted since the erection of the prison, in 1826, is 2,550. Of the present inmates about 40 are under sentence for life for murder and arson. Of the convicts, 23 work in the wood-shop, 15 in the paint-shop, 34 in the blacksmith-shop, 10 in the shoemaker's shop, 45 in the harness-shop, 8 at trimming, 3 at tailoring, and 43 at other employments.

In the Insane Hospital, on the 1st of December, 1880, there were 436 patients—226 men and 210 women. There were subsequently admitted 215 persons—129 men and 86 women, making a total number under treatment of 651—355 men and 296 women. Of these there were discharged 201—115 men and 86 women—leaving in the Hospital on the 1st of December, 1881, 450 patients—249 men and 210 women. The record of deaths varies but little from previous years, being but about ten per cent of the daily average resident. Many of these were old residents at the Hospital, advanced in years and worn with disease. The average age of those who died was 51.7 years—the youngest eighteen and the oldest eighty-seven. The whole number of patients admitted and discharged since the Hospital was first opened, in 1840, is as follows: 5,759 admitted, and 5,309 discharged. Of the latter, 2,201 recovered, 1,054 improved, 943 did not improve, and 1,107 died. It is expected that the new pavilion for females will be completed and ready for occupancy during the coming year. This will accommodate 45 patients. The cash receipts have amounted to \$103,023.15; the disbursements to \$100,869.65, leaving a balance of cash on hand of \$7,156.50. The resources, including this balance, and the value of various supplies on hand, are \$40,888.25; the liabilities, comprising dues for various supplies, and due to employes, are \$16,058.81.

The aggregate liabilities and resources of the savings-banks of Maine, at the close of the year, were as follows:

LIABILITIES.	
Deposits.....	\$26,474,554 97
Reserved fund.....	571,015 83
Special reserved fund.....	162,204 04
Profits.....	671,082 17
Other liabilities.....	182,645 85
Total.....	\$28,361,401 86

RESOURCES.	
Cash.....	\$1,297,221 86
United States bonds.....	5,802,259 03
State of Maine bonds.....	55,875 00
Other public funds.....	7,709,353 77

Brought forward.....	\$14,804,709 71
Railroad bonds.....	2,541,579 83
Bank stock.....	1,199,463 83
Real estate.....	1,200,438 19
Other investments.....	864,047 89
Loans on mortgages of real estate.....	4,984,511 13
Other loans.....	2,766,652 23

Total.....\$28,361,401 86

Other important facts are given below:

Present number of savings-banks.....	55
Number of depositors.....	87,977
" " not over \$500 each.....	60,797
" " over \$500 each.....	27,180
Net increase of deposits the past year.....	\$2,860,893 37
" reserved fund.....	263,355 70
Amount of dividends paid depositors the past year.....	1,006,493 35
Amount of State tax paid the past year.....	174,226 04
Increase of investments in United States bonds the past year.....	1,606,347 99
Decrease of investments in State of Maine bonds the past year.....	12,250 00
Increase of investments in other public funds the past year.....	563,577 97
Increase of investments in railroad bonds the past year.....	174,491 11
Increase of investments in bank-stock the past year.....	424,567 50
Decrease of loans on mortgages of real estate.....	254,952 10

The number of savings-banks is the same as in 1880. The number of depositors has increased 7,030. The deposits have increased \$2,860,893.37, showing a marked increase of general prosperity in the State. In the hard times of 1878 the deposits of the savings-banks decreased \$3,725,320. In 1879 they decreased \$186,363. In 1880 prosperity began to revive, and the deposits in the savings-banks at the end of the year had increased \$1,968,183. This year the increase has gone on.

The Fish Commissioners report that the run of salmon commenced unusually early in 1881, and was remarkable for the large size of the fish. As to numbers, the run was the smallest of the past three years, but the largest for the previous ten or twelve years. There has been a distribution of over half a million salmon in the Penobscot, Kennebec, Androscoggin, Saco, Presumpscot, and Machias Rivers.

For the year's result, the contribution to the Bucksport and Orland salmon-works was \$2,000; dividend of salmon-eggs, 1,080,000. The contributions to the Orland works were as follows: by Maine, \$2,000; dividend of eggs, 1,080,000; by Massachusetts, \$500; dividend of eggs, 270,000; by Connecticut, \$300; dividend of eggs, 162,000; by the United States, \$1,757; dividend of eggs, 950,000. Total—money, \$4,557; eggs, 2,462,000. The Penobscot is the only river on the Atlantic coast of the United States from which a supply of sea-salmon eggs can be obtained for propagation.

The commissioners reported that they had but 60,000 landlocked salmon-eggs from a \$300 contribution. There are two great hatcheries in the State owned by the United States and associated States, one at Orland and the other at Grand Lake Stream. The contributions to the Grand Lake Stream fund were as follows: Maine, \$300; dividend, 60,000 eggs. New Hampshire, \$250; dividend, 50,000 eggs. Massachusetts, \$500; dividend, 100,000 eggs. Con-

nectient, \$500; dividend, 100,000 eggs. United States, \$1,450; dividend, 290,000 eggs. Total money, \$3,000; total eggs, 600,000.

During the year 2,000,000 shad were given by Professor Baird, the United States Commissioner of Fisheries. These fish were divided between the Penobscot and Kennebec Rivers, 1,000,000 having been turned into the Sebasticook at Waterville, and 1,000,000 into the Mattawaukeag, near its junction with the Penobscot.

The following ponds have been stocked with black bass this year: Trip Pond, in Minot; Gardiner Pond, in Wiscasset; Gun Point Ice Company's Pond, at Harpswell; Hosmer Pond, in Rockport; Kezar Ponds and Heald and Cushman Ponds, in Lovell; and Little Pushaw Pond, in Corinth.

During the year four citizens of the State upon trial were convicted of murder in the first degree. Two verdicts of manslaughter were rendered, and two additional indictments for murder were found and sentence imposed in one upon a plea of guilty, the court adjudging the grade to be murder in the first degree. Two citizens were sentenced to imprisonment for life for the crime of arson. The Attorney-General in his report remarks as follows: "The convictions for murder in the first degree during the present year alone exceed the number during the three years previous to the abolition of the death-penalty, and are nearly equal to the number occurring during the three years following. The frequency of these horrible crimes and the fiendish brutality exhibited in the commission of a large portion of them has naturally created a sentiment in the community for the application of the death-penalty in cases of such atrocious character. There are arguments for and against its application—arguments that are satisfactory to the minds and consciences of the adherents and opponents. Any amount of discussion of the question, I apprehend, would have but slight effect upon the convictions already formed by the mass of our citizens. The laws are for the protection of the public, of society, and are not presumed to be in sympathy with the hardened criminal, and if the law-abiding and peaceable citizens of this State, who desire to live with some sense of security, can be better protected from the assassin's knife or the ruffian's bullet by the restoration of the death-penalty, it is a matter that should receive the most careful and serious consideration of the Legislature."

During the year ending November 1st, the whole number of prosecutions and offenses in the State was 1,200. Of these more than half were for violation of the liquor law. Franklin County has the cleanest record, there being but 7 criminal cases in the entire year. Kennebec had 210 and Cumberland 298. In Kennebec County there were 135 cases for violation of the liquor law, a greater number than in any county except Cumberland, which had 174. Of the prosecutions and offenses 10 were

for homicide, 3 for arson, 3 for perjury, 11 for forgery and counterfeiting, 30 for compound larceny, 70 for larceny, 5 for burglary, 2 for robbery, 2 for rape, 16 for assault with felonious intent, 103 for assault and battery, 4 for affrays and riots, 11 for offenses against chastity and morality, 13 for malicious mischief, 9 for cheating and conspiracies, 6 for defects in highway, 119 for nuisance, 646 for violation of the liquor law, 118 for other offenses.

The Reform School is in a prosperous condition. Since the institution was founded by the State, twenty-eight years ago, 1,678 boys have been received and cared for, and there were in the school, December 1st, 113 boys. Thirty-four boys were committed during the year. Twenty-six acres of land have been under cultivation. The farm is in a high state of improvement, and the value of the crops harvested, milk and meat sold, was \$7,501.83. A large portion of the boys are employed in the chair-shops. The receipts from December 1, 1880, to December 1, 1881, were:

Balance on hand December 1, 1880.....	\$481 76
From State Treasurer	18,000 00
Farm and stock	2,086 55
Chair-work	3,189 87
Cities and towns	2,696 71
All other sources	274 84
Due Treasurer of Reform School	2,000 00

Total \$23,629 23

The expenditures during the same period have been \$23,247.45, leaving a balance on hand of \$451.78. The schools are under the charge of competent teachers. The present number of boys under instruction is 113.

The following table gives the number of male citizens of the State between eighteen and forty-five years of age:

COUNTIES.	Number in 1880.	COUNTIES.	Number in 1880.
Androscoggin	5,732	Penobscot	11,147
Aroostook	5,355	Piscataquis	2,247
Cumberland	13,092	Sagadahoc	3,064
Franklin	2,753	Somerset	4,882
Hancock	6,412	Waldo	4,979
Kennebec	7,830	Washington	6,691
Knox	4,971	York	9,569
Lincoln	3,685		
Oxford	5,068	Total	97,510

The following are the valuation and population of the cities of Maine, as reported by the Valuation Commission:

CITIES.	Population in 1880.	Valuation in 1880.	Valuation in 1870.
Auburn	9,556	\$5,099,446	\$2,918,101
Augusta	8,666	5,168,964	4,881,185
Bangor	16,857	8,788,605	10,086,561
Bath	7,575	5,918,192	6,402,718
Belfast	5,308	2,463,677	2,660,879

Total	146,618	\$86,758,818	\$83,548,595

Under the new railroad-tax act, the assessments on the several companies operating the railroads of Maine were as follows:

Bangor and Piscataquis.....	\$207 00
Boston and Maine.....	17,245 35
Bucksport and Bangor.....	46 75
Knox and Lincoln.....	615 56
Portland Horse.....	932 20
Portland and Ogdensburg.....	600 42
Portland and Rochester.....	1,159 87
Rumford Falls and Buckfield.....	67 54
Somerset.....	51 98
St. Croix and Penobscot.....	51 82
European and North American.....	3,040 33
Sandy River Valley.....	23 13
Eastern.....	16,786 29
Maine Central.....	20,772 25
Grand Trunk.....	9,569 66
Aroostook River.....	20 12
Houlton Branch.....	17 30
Orchard Beach.....	11 19
Total.....	\$71,273 26

The Governor and Council assessed the following tax upon the telegraph companies in the State, as required by law:

Maine Telegraph Company.....	\$1,250
Western Union.....	2,500
International.....	1,250
American Union.....	125
Atlantic and Pacific.....	125
Montreal Telegraph Company.....	500
Total.....	\$5,750

The following table exhibits the amounts assessed on express companies:

NAME OF PARTY ASSESSED.	Amount of business done.	Tax.
American Express Company.....	\$150,000 00	\$1,125 00
Canadian Express Company.....	25,000 00	187 50
Hoyt & Company.....	2,000 00	15 00
Merchants' Express Company.....	11,541 00	86 55
Charles O. Milliken.....	4,000 00	30 00
Prince's Express.....	7,539 61	56 91
Sandy River Express Company.....	500 00	3 75
Saco, Biddeford and Boston.....	3,000 00	22 50
United States Mail and District Express Company.....	2,000 00	15 00
Swett's Express Company.....	5,000 00	37 50

According to the census of 1880, Maine had employed in cotton manufactures 696,685 spindles, and 11,319 hands.

In 1870 there were about 250,000 tons of ice harvested on the Kennebec River, at a cost of about a dollar a ton. The amount has grown annually, until it reached its maximum in 1880, when 1,000,000 tons were stored on the Kennebec and its vicinity. Last winter, owing to the intense cold weather which prevailed all over the country, and which made a good ice-crop on the Hudson, and in the ponds in Massachusetts and New York, but about 600,000 tons were stored on the river, at a cost for harvesting of from fifteen to twenty-five cents a ton.

The cut of lumber on the Penobscot waters during the season reached 150,000,000 feet or more. There is an overstock of 60,000,000 old logs, and the cut of 1882 is estimated at over 100,000,000 feet. In 1879 the hay-crop of Maine was valued at \$11,500,000, and all other crops of the State at \$7,250,000.

A State Temperance Convention was held early in the year, at which the following resolutions were adopted:

1. The great advance of the temperance movement in Maine is largely due to a recognition by temperance people of total abstinence as the indispensable basis of all permanent work.

2. Thirty years' trial of prohibition, interrupted by a two years' trial of license, has demonstrated to the satisfaction of a large majority of our people that prohibition is the most effective legal policy ever devised to restrain the dram-shop evil and increase the efficiency and permanency of those moral agencies on which temperance progress mainly depends.

3. To remove the question of prohibition from the field of partisan politics and give it the strength which attaches to all principles settled by a solemn vote of the people, incorporated into the fundamental law, we respectfully but earnestly request the Legislature to submit to the people a prohibitory constitutional amendment, as prayed for by a large number of petitioners.

To the Honorable, the Legislature of Maine:

The Maine State Temperance Convention, now in session at Augusta, most respectfully represents to the Honorable, the Legislature, that it is desirable, as far as possible, to remove the liquor question from the arena of party politics. To the convention, it seems to be a particularly suitable mode of doing this, to submit the question of prohibition to a direct vote of the people, on a proposition to incorporate it into the Constitution. The convention, therefore, most earnestly prays that the following proposition may be submitted to the people at the earliest time at which it can be legally done, viz:

The manufacture, for sale, of intoxicating liquors of whatever kind, is and shall be for ever prohibited, except the manufacture of cider, which is remitted to the discretion of the Legislature. And the sale of intoxicating liquors, of whatever kind, is and shall be for ever prohibited, except for medicinal and mechanical purposes and for the arts, which shall be provided for by law, through suitable agencies appointed for that purpose. The sale of cider may be permitted under such regulations as the Legislature may provide. And the Legislature shall from time to time enact such laws with whatever penalties may be deemed necessary for the entire suppression of the manufacture and sale of intoxicating liquors, with the exceptions and conditions herein specified.

A meeting of lawyers was held at Augusta on April 25th, and a State Bar Association was formed.

The population of the State by counties, in 1880, as compared with 1870, was as follows:

COUNTIES.	1880.	1870.
Androscoggin.....	45,042	85,566
Aroostook.....	41,700	29,609
Cumberland.....	56,359	82,021
Franklin.....	18,150	18,507
Hancock.....	38,129	86,495

York.....	62,237	60,174
The State.....	648,936	626,915

MANLY, MATTHIAS EVANS, born in Chatham County, N. C., April 13, 1800; died at New Berne, N. C., July 16, 1881. He was the son of Rev. Dr. Basil Manly, an eminent Baptist divine of Alabama. After graduating at a university he studied law with his brother, the

Hon. Charles Manly, of Raleigh, N. C., and then removed to Newbern, from which town he was elected a member of the House of Commons in 1834. He was the last representative of that ancient borough, the convention to amend the Constitution in 1835 having abolished its right of representation. In 1840 Mr. Manly was elected Judge of the Superior Court. This position he filled with honor for twenty years, when he was promoted to the Supreme Bench, where he served most acceptably until he retired about the close of the war. Soon after the termination of hostilities he was chosen, with Governor Graham, by the Legislature of North Carolina, to represent the State in the United States Senate; but they were not allowed to take their seats. Judge Manly continued to practice law in Newbern up to the time of his death, and enjoyed the highest esteem of that community and of the State at large, as a man of great legal ability and eminent personal virtues.

MARYLAND. The presidential vote in 1880 was as follows: for the Garfield electors, 78,515; Hancock electors, 93,706; Weaver, 818. In November, 1881, an election was held for Comptroller of State and members of the Legislature. For Comptroller, Keating, Democrat, had 13,600 majority over Gorsuch, Republican. The vote, so far as received, was 70,629 for Keating and 57,029 for Gorsuch. The Republicans carried more than half the counties in the State, and the Democratic majority was due to the large vote in the city of Baltimore. The Legislature consists of 16 Democrats and 10 Republicans in the Senate, and 59 Democrats and 32 Republicans in the House. The Democratic majority in the two Houses is smaller than it has been for fifteen years. Of the Democratic Senators 6, and of the Democratic Assemblymen 18, are said to be opposed to the present management of the party.

The following condition of the Treasury is shown by the tables of the Comptroller for the fiscal year ending September 30, 1881:

Total receipts during the fiscal year.....	\$1,996,641 08
Balance in the Treasury September 30, 1880.....	513,026 86
	<hr/>
Disbursements for the fiscal year.....	\$2,509,667 44
	1,737,469 15
Balance in the Treasury September 30, 1881....	\$752,198 29
The receipts into the Treasury were from the following sources:	
From direct tax.....	\$1,018,500 47
From internal improvement companies, dividends and interest.....	225,076 94
From the ordinary sources, to wit:	
Licenses, gross receipts, foreign insurance, etc	753,063 67
Total receipts.....	<hr/>
	\$1,996,641 08

The disbursements were as follows:

To interest on public debt.....	\$648,340 27
To public schools.....	510,413 09
To credit of sinking fund.....	19,467 50
To redemption of debt.....	24,000 00
To the ordinary expenditures, to wit:	
Salaries, colleges and academies, public institutions, etc.....	560,248 30
Total disbursements.....	<hr/>
	\$1,757,469 15

The direct tax is that which is levied and collected from the assessable property of the State, which is now 18½ cents on the \$100 of property, and which brought into the Treasury during the last fiscal year the following sums:

For Normal School and House of Correction loan, now paid.....	\$1,415 18
For public schools, tax 10 cts.....	543,771 78
For bounty or defense loan, tax 5½ c.....	299,187 95
For Deaf and Dumb Asylum loan, tax ¼ ct....	40,484 70
For Hospital loan, tax 1 ct.....	54,888 60
For Treasury Relief loan, tax 1¼ ct.....	79,252 26
Total tax, 18½ cts.....	<hr/>
	\$1,018,500 47

The loans above referred to are the following:

Defense or bounty loan, due in 1889.....	\$8,326,750 66
Deaf and Dumb Asylum loan, due in 1885 and 1889.....	225,000 00
Maryland Hospital loan, due in 1887 and 1891.	465,000 00
Treasury Relief loan, due in 1893.....	500,000 00

Total amount of these loans..... \$4,516,750 66

This part of the public debt being provided for by these specific taxes, and there being no other direct tax except that for schools, which belongs exclusively to them, other sources for the payment of the remaining interest on the public debt have to be looked to.

The public debt at the end of the fiscal year ending September 30, 1881, was.....	\$11,257,560 69
Deduct amount provided by these taxes.....	4,516,750 66

Leaving the interest to be paid from other sources on this amount of debt..... \$6,740,810 03

Which is in loans, as follows:	
Five per cent sterling loan, interest payable in London, in gold, and due in 1889.....	\$4,185,555 58
Five per cent currency, due in 1890.....	340,554 83
Three per cent currency, due in 1890.....	269,000 00
Six per cent currency, due in 1885.....	528,355 00
Six per cent currency, due in 1890.....	361,940 47
Six per cent currency, Maryland State loan, for redemption and exchange of State debt.....	1,056,304 10
Total.....	<hr/>
	\$6,740,810 03

The productive assets or credits of the State at the end of the last fiscal year are as follows:

Stock of Annapolis Water Company.....	\$30,000 00
Stock of Farmers' National Bank at Annapolis	46,470 00
Stock of Washington Branch B. & O. R. R.....	550,000 00
Stock of B. & O. R. R., 6 per cent dividend...	965,015 70
Bonds B. & O. R. R.....	866,000 00
Mortgage on Northern Central Railroad.....	1,500,000 00
Total dividend and interest-bearing assets....	<hr/>
	\$3,461,085 00

The whole interest paid upon the public debt for the last fiscal year was..... \$648,340 27

Deduct the interest upon the four loans already provided by the direct tax.....	271,005 02
Interest to be provided from other sources....	<hr/>
Deduct therefrom the proceeds from internal improvement companies, dividends and interest.....	225,076 94

Leaving balance of interest to be paid from the ordinary resources of the Treasury..... \$147,258 81

The ordinary resources are.....	\$753,063 67
The ordinary disbursements.....	560,248 30

Leaving ordinary receipts over ordinary expenditures, for fiscal year, 1881..... \$192,815 37

Deduct payment made on redemption of debt of \$24,000 and amount carried to credit of sinking fund of \$19,467.50.....	43,467 50
Leaving net balance of.....	<hr/>
	\$149,347 87

Balance of interest to be paid..... 147,258 81

Surplus..... \$2,089 56

This shows a small surplus. But it will be observed that the public schools received but \$510,413.08, while the amount really collected for them from the tax of ten cents was \$543,771.78, showing, also, that this difference of \$33,358.70 went into the ordinary or usual receipts, which, if paid to the public schools, would have left a deficit in the Treasury of the large sum of \$31,269.14, to be supplied from receipts absolutely appropriated to other specified purposes. This, too, occurred in a year when there was no legislative session. In a legislative year the deficiency would have amounted to upward of \$200,000. The Governor calls attention to the diversion of funds from the sinking fund, and other guaranteed objects, and to the extravagance which results therefrom. He thinks the people will not justify a new loan or additional taxation, but that further deficiencies must be prevented by retrenchment. He recommends more stringent measures against tax-collectors to enforce the payment of overdue taxes. There was due the State, from 1845 to 1830, inclusive, the sum of \$546,613.54, from collectors of taxes in the city and the several counties. There was due for the same time by the sheriffs the sum of \$27,833.44, and also by incorporated institutions the sum of \$102,796.31, making altogether an aggregate of \$677,243.29 thus due, a portion standing for a long time.

"The whole tax and collection system," says the Governor, in his message to the Legislature, "needs revision, and I would respectfully submit to your consideration the propriety of authorizing the Executive to appoint a non-paid commission of gentlemen, who would take an interest in the subject, for that purpose, and to report to the next Legislature."

He recommended the reduction of the number of tax-collectors from eighty-four to twenty-four, one for each county and the city of Baltimore, as tending to simplicity and efficiency. As tending to economy, he recommended the abolition of various unnecessary offices. On the subject of retrenchment the Governor remarks:

The extraordinary legislative expenses for a series of past sessions have been the subject of great public concern and of just complaint. There were 111 members in both bodies, and at the last session there were 105 officers and employés. The per diem, mileage, and stationery of the members was \$57,767, while that of the officers and employés was \$59,194.25. This exhibit can not be repeated without causing widespread dissatisfaction among the people. This large expenditure for officers and employés was made up by regular per diem, additional pay, and extra compensation.

There is no law prescribing the number of officers, or fixing compensation, with the sole exception of that of 1868, chapter 61, which provides only what officers of the preceding session shall return to the opening of the new session, and confines the number to five for both Houses. Besides this one provision, the whole subject is left without system or law. To avoid like excesses and abuses in the future, it is indispensable that a well-ordered system be established by law for the regulation and conduct of this branch of the service.

A well-considered bill was matured at the last session, limiting the number of such appointments for both Houses to thirty-nine, an ample number, in my judgment, and fixing their aggregate compensation at \$17,330, a retrenchment in this service alone of \$42,000. This bill failed to pass, but I take the liberty of commending it to your consideration. In any law to be passed upon the subject, great care should be taken that any compensation other than that fixed by the law itself, should be expressly forbidden to be paid by the Treasury.

In view of the general laws providing for so many interests in the State, and which before applied for legislation, the session, with diligent application to business, ought not to extend over sixty days, if even that long.

The public printing, that for the Legislature as well as for all the departments, requires your earnest consideration. There is now no system whatever regulating this important and expensive branch of the service. In no other branch has there been a more inconsiderate or wasteful expenditure of the public money.

The printing of the Legislature alone, including indexing, etc., for the last four sessions, amounted to \$187,636, averaging \$46,909 a session, and that for the departments, including advertisements, from \$5,000 to \$10,000 annually, depending upon the work done.

Here is an unquestioned opportunity for a sterling retrenchment.

The publication of the laws is another subject to which public attention has been attracted. The expenditure is so large, and at the same time so monopolized, that it could not escape inquiry and criticism with just men or with tax-payers. It is a system of comparatively modern invention. Prior to 1865 such systematic publication was unknown.

The act of 1865, chapter 31, first inaugurated the practice, and by act of 1868, chapter 67 and chapter 440, it was more definitely defined by directing the publication to be made at the expense of the State, and to be paid on the warrant of the Comptroller. This act provides that every public general law to take effect before the first day of June is to be published daily for one week in two daily newspapers in Baltimore city, one of which shall be in the German language, and one newspaper in each county having the largest circulation. No terms are prescribed nor price fixed, and the Treasury Department paid the sum of \$1,200 to each county newspaper—in some instances dividing it between two—and \$5,550 to city newspapers—dividing it among three—for the publication of the laws of the session of 1880. The aggregate amount paid for this session for the counties and the city was \$33,150; for the session of 1878, \$33,064.70; for the session of 1876, \$31,689; making an aggregate of \$97,903.70 for these three sessions.

In these three items of expenditure alone—the legislative expenses, the public printing, and the publication of the laws—there can be a judicious saving of at least \$70,000.

The origin of the system in 1865 was to support from the Treasury a partisan press not then supported by the people, and, though the cause has ceased, the practice still continues. It should stop; and therefore I recommend the repeal of those acts of 1865 and 1868, and thus, while relieving the Treasury from a heavy charge, at the same time relieve the press from patronizing influences. If it should be considered necessary, from time to time, to make publication of important laws in newspapers, provision could be made for it.

At the last session there was a well-matured bill prepared, authorizing the Governor and Attorney-General to have such publication made of any laws that might be deemed to be of sufficient public interest, but it failed to pass.

The State fishery force, or, as it is commonly called, the "Oyster Navy," is now con-

ducted under the act of 1880, chapter 198. When the service was first established it was expected that it would not only be self-sustaining, but yield a considerable revenue to the State. In both these respects the service has proved a failure, and has not been as efficient in any respect as was anticipated.

Practically the service is a failure. The force is not efficient; the sloops are not suited to the service, and the steamer is unfit for it. And the service itself is regarded by many more as an instrument of personal or partisan interest than as a means to sustain a public policy.

The disbursements for this service for the fiscal year 1880 were.....	\$41,784 97
Receipts for the same year.....	19,611 04
This deficiency paid out of the Treasury.....	\$22,173 93
The receipts from the service for the fiscal year 1881.....	\$44,925 71
Disbursements for the same year.....	38,403 62
Excess of receipts over expenditures.....	\$6,522 09

This excess, thus for the first time for years relieving the Treasury from a heavy charge, is to be attributed to the more efficient provisions of the act of 1880. The receipts from licenses are more than doubled, while a reduction of salaries has diminished expenditures.

Under the present and under preceding laws there are two classes of oyster-men—those who take by rakes or tongs, and those who take by scoops or dredges. The former are obliged to get a license from the clerk of the county of their residence to take oysters within prescribed limits, and the revenue derived from these licenses goes to the public schools of such county. The latter get license from the Comptroller to take oysters in the open bay and sounds, and within defined limits, beyond which they are not to go, and the revenue from such license is paid into the State Treasury. The whole service for enforcing the laws as to both classes or protecting the rights of either is borne by the State, while certain counties get the entire revenue from the one class.

The act of 1880, chapter 36, regulates the taking of oysters in the Potomac River. This act, to take effect, requires the passage of a similar act by the State of Virginia.

Upon this subject the Governor says:

For myself, upon some consideration, I have formed conclusions that moderate dredging improves the beds, while, upon the other hand, if it continues as now carried on, the period will not be far distant before the beds are practically destroyed. What is to be done in the conflicting views and interests is the trouble.

A system something of this kind I would suggest: That the present lines, or others that may be more convenient or eligible, be fixed separating the tonging from the dredging interests; that the sloops be sold or transferred to the counties to protect their local interests, and to have whatever revenue can be derived from it without conflicting with the general revenue to be derived from the trade for the State; that the dredgers be obliged to take out licenses as now provided, but at a nominal charge; that the dredging-grounds be divided into three districts, well defined

and easily distinguishable, and as nearly equal in oyster surface as can be; that but one of the districts be open to dredging for the season, and the other two in successive years, then returning to the one first opened; that the enforcement of the regulations of this system will require an active service of four or six steam-tugs; will be somewhat expensive, and will require considerable revenue. To this end, the oysters ought to be taxed by the gallon and bushel, and the taxes paid through stamps and permits to be sold under rules prescribed by the Comptroller, by clerks of courts, officers of the steamers, and others that he might designate; that no companies or individuals in the State should transport or carry any packages containing oysters, whether shucked or in the shell, unless duly stamped, and no vessels to carry them out of the waters of the State without having the packages stamped, or if in bulk the quantity permitted. All these to be enforced by severe penalties, and, in case of violation of any of its provisions, vessels to be confiscated, or, if fined, the vessel to be held for the fine.

I feel that a system perfected upon some such basis would insure a large revenue, sufficient not only to support the service, but yield a considerable amount to the State. It does appear hard that while real estate and every other industry is taxed for the support of the State, this one great productive branch should be measurably exempt.

On the subject of the inspection of tobacco great differences of opinion exist, both among planters and buyers.

For the fiscal year ending September 30, 1880, the receipts from the five warehouses were.....	\$57,618 05
Total disbursements, except for salaries of inspectors, insurance, and ground-rent.....	82,988 90
Net earnings.....	\$4,624 15

But, as against these earnings, the sum of \$13,668.07 was paid by the Treasury to the inspectors for their salaries, and for insurance and ground-rent, leaving a deficiency of \$8,645.54 as a charge upon the Treasury.

For the fiscal year ending September 30, 1881, the receipts were.....	\$75,320 02
Disbursements, except for salaries of inspectors, etc.....	64,734 90
Net earnings for fiscal year, 1881.....	\$10,585 12

But, as against these earnings, the sum of \$10,898.11 was paid by the Treasury to the inspectors for their salaries, and for insurance and ground-rent, leaving a deficiency of \$312.99 as a charge upon the Treasury, showing, however, in this respect, a considerable improvement over preceding years.

Great complaint is made of the mode of inspection, that while it inspires no confidence or gives no guarantee as to the quality of the article in the package, its imperfections tend to encourage false or careless packing. The market for this important product is impaired in the principal foreign marts. Buyers for shipment abroad are subject to reclamations, and the traffic that should be buoyant is embarrassed in every stage of progress toward the manufacturer.

There was appropriated for the support of the State House of Correction for the fiscal year 1880 the sum of \$31,400, and there was paid out of the Treasury for such support the sum of \$31,129.27; other expenditures were

made, but the receipts of the institution met them.

The appropriation for the fiscal year 1881 to this institution was \$45,000; \$20,000 of which was to be expended in the erection of additional workshops and for the purchase of land, thus leaving \$25,000 for the support of the institution proper, and in addition there was appropriated \$400 to pay insurance on buildings. The tables of the Comptroller show that \$30,400 was paid out of the Treasury on this appropriation.

The report of the treasurer of this institution shows that the total expenditures for its support for the fiscal year 1881 were \$29,894 91
Total receipts from labor, etc. 4,158 76

Balance of expenditures..... \$25,736 15

This shows an excess of \$736.15 over the appropriation.

There was \$6,687.50 paid for the purchase of land; no additional buildings were erected, leaving the balance of the appropriation of \$20,000 untouched.

There were during the year 414 prisoners received and 405 discharged, but one having died, and there remained September 30, 1881, 179 prisoners; of the 414 so received 202 were white males and 44 white females, 128 colored males and 40 colored females.

The Penitentiary paid into the Treasury over and above all expenditures, for the fiscal year 1880, the sum of \$13,001.85, and for the fiscal year 1881, \$7,326.43. The report made by the president and directors of the Penitentiary for the fiscal year 1880 shows that there were in prison on November 30, 1880, being the end of the fiscal year for that institution, 591 prisoners, of whom 191 were received during the year.

The amount of State taxes assessed upon corporations in Maryland was \$112,504—a considerable gain over the figures of any preceding year since the passage of the law by which such properties are made to contribute a share of the expenses of government. The increase has principally been made by bringing within the reach of assessment the capital stock of corporations that had previously escaped taxation. The total assessed value of the shares of stock of all the corporations in Maryland is \$59,166,806; they hold \$20,302,619 worth of real property; the amount of credit for investments paying taxes is \$1,363,051; the investments in mortgages on real property liable to taxation foot up \$4,415,245, and the State tax on the balance is \$62,137. The savings-banks held in 1881 \$24,582,591 of deposits; but only about one fourth of this sum was liable to taxation, yielding a revenue of \$12,373. The total assessed value of real and personal property was \$461,459,939; the net basis of assessment of corporations was \$61,311,375, and when from these showings are subtracted \$20,831,846 for the real property of corporations, it leaves as the full amount liable to State taxes, \$501,939,468, of which \$225,877,908 is located in the city of Baltimore.

A division exists in the Democratic party of this State between Governor Hamilton and his supporters on the one hand and the party organization as now controlled on the other. It is contended that the organization is in the hands of a few men who manage it for the advancement of their personal interests, and that their management has led to extravagance in the government and electoral abuses, especially in the city of Baltimore. The matter of the registration of voters has aroused wide-spread interest. No new and systematic registration has been made for years, and it is contended that the lists are encumbered with the names of non-residents and dead men, giving ready opportunity for fraud.

According to the census of 1880, there were employed in cotton manufacturing in Maryland 2,325 looms and 125,014 spindles, with 4,159 hands. Coal produced, 2,228,917 tons. The tobacco-crop in 1880 aggregated 26,082,147 pounds, against 15,785,339 pounds in 1870, an increase of 10,296,808 pounds, or nearly 70 per cent. The crop of wheat in 1880 was 8,004,484 bushels, produced on 569,246 acres, and showing an average of a little over 14 bushels per acre, which is a great improvement. In 1870 the wheat-crop was 5,774,504 bushels, showing an increase of 40 per cent for 1880. The corn-crop in 1880 was 16,237,621 bushels, against 11,701,817 bushels in 1870, an increase of 40 per cent, with a yield of 24½ bushels per acre. The oats-crop was 1,794,872 bushels, yielding 17 bushels per acre—only a little more than half as much as was produced in 1870. The crop of rye was 288,371 bushels, against 307,089 bushels in 1870. The culture of tobacco is being resumed in the southern Maryland counties. Anne Arundel and Calvert have increased their crops 30 per cent; Charles County, 150 per cent; and both Prince George's and St. Mary's have nearly doubled theirs. In other words, the effects of the war and the changes in the labor system are nearly all readjusted. The table on the following page gives the yield of the chief crops by counties.

According to the census, the whole number of elementary schools in the State is 2,020; schools for colored children, 390; number of school-buildings, 1,934; total seating capacity of the schools, 150,832. The number of white male teachers is 1,079; of white female teachers, 1,613; of colored male teachers, 232; of colored female teachers, 157—total, 3,081. Of these teachers, 1,185 have high-school education; 424 normal-school training; and 213 college education. The average salary is \$31.89 per month. The number of pupils in attendance during the year 1880 was: white male, 65,256; white female, 57,346; colored male, 13,366; colored female, 13,167—total attendance, 149,135. Sources of income: State taxes, \$551,924.32; county, town, and city taxes, and other special taxes, \$733,250.71; tuition fees, \$6,423.17; all other sources, \$87,992.56—total,

\$1,379,590.76. Expenditures, \$2,026,296.57. Illiteracy during 1870, between the ages of ten and twenty-one, was 7,296; in 1880 this number is reduced to 4,530. Thus, during the past decade, while the population of the State has increased, the number of those between the ages of ten and twenty-one who can not read and write has been reduced about one third. The number over ten years of age who can not read is 111,387; who can not write, 134,488, of whom 44,316 (36,027 native and 8,289 foreign) are white, and 90,172 colored.

There are 700 dredging-boats, paying \$916,300 to 5,600 men; 550 scraping-boats, paying \$297,000 to 2,200 men; 1,825 canoes, with 5,148 men, earning \$1,158,300; and 200 runners, with 800 men, at \$166,400 for the season, making a total of 13,748 men engaged in catching oysters in Maryland, with wages and earnings amounting to \$2,538,000 during every oyster season, or an average of \$184.60 for each man. Invested in oyster-boats in Maryland the summary is:

700 dredgers, at an average of \$1,500.....	\$1,050,000
Outfit of same.....	70,000
550 scrapers, at an average of \$300.....	440,000
200 runners, at an average of \$1,500.....	300,000
1,825 canoes, at an average of \$100.....	182,500
3,275 Total.....	\$2,042,500

Baltimore is the great center of the packing-trade. During the census year the number of vessels loaded with oysters arriving at that port was 9,543, bringing 7,252,972 bushels. In addition to this amount, there were 25,000 bushels brought by the bay steamboats, making a total of 7,277,972 bushels, of which 3,769,353 bushels were packed raw, 2,689,939 bushels cooked and hermetically sealed, and 818,680 bushels used for local consumption. The amount of capital invested in the business is \$2,338,300, and the estimated value of the packing-houses \$1,360,966. The number of shuckers employed by the oyster-packers of Baltimore is 6,627, of which 4,167 are males and 2,460 are females.

From the prolific beds of the Chesapeake Bay several million bushels of oysters are annually taken to restock the exhausted beds of other localities, and equally as many for consumption in Boston, New York, and other Atlantic sea-ports. More than 200 vessels, averaging in value \$3,000 each, are, for eight months of the year, engaged in the trade between the bay and Northern cities. The oysters shipped North during the winter are used for immediate local consumption, with the exception of those carried to Fair Haven, Connecticut, which are packed and shipped elsewhere. Those taken North in the spring are almost exclusively for bedding purposes. They are planted on the bedding-grounds at New York, Providence River, and other places, and allowed to remain from spring to winter, during which time they fatten rapidly, and when taken for use are much superior to what they were when planted. During the census year the shipments of oysters in shell from Maryland to Northern cities amounted to 2,021,840 bushels.

The following is a summary of the Maryland oyster business:

CAPITAL INVESTED.	
In packing.....	\$3,928,376
" boats.....	2,042,500
" can-making, ship-building, etc.....	250,000
" local trade.....	25,000

Total..... \$6,245,876

Production and disposition in bushels, including 1,000,000 brought from Virginia:

Catch.....	10,569,012
Packed.....	7,653,492
Shipped North.....	2,021,840
Local consumption.....	1,898,650

Persons employed and their earnings:

EMPLOYÉS.	Number.	Wages and earnings.
Employes of packing-houses.....	8,680	\$777,779
On oyster-boats.....	13,798	2,537,940
All others.....	1,990	504,502
Total.....	24,427	\$3,820,521

The average number of oysters to a bushel is about 175, at which rate there are annually taken from the Chesapeake Bay and its tributaries (in Maryland and Virginia) over 3,000,000 oysters (17,406,332 bushels), or about sixty for each inhabitant of the United States. In this trade nearly 10,000 vessels and over 40,000 people are employed; while the total amount of capital invested reaches \$7,606,976, and the amount of wages earned \$6,956,444.

The following table gives the population of the State by counties, as finally returned by the census of 1880, and as compared with the returns of 1870:

COUNTIES.	1880.	1870.
Allegany.....	88,012	88,586
Anne Arundel.....	28,526	24,457
Baltimore.....	83,836	63,357

State.....	934,943	739,394

The Democratic State Convention met in Baltimore on the 24th of June, and renominated Comptroller Keating. The following platform was adopted:

To the Democratic Voters of Maryland:

You have passed since 1867 through many severe conflicts; but you have maintained the control of the internal affairs of the State, and have kept the State in steadfast opposition to the purpose of the Republican party to centralize the powers of the Federal Government.

Your success has been wholly due to your collective power of grasping the questions which concern your interests, and of enforcing obedience to your requirements.

Under the influence of different causes, an undue part of the burden of taxation, on account of the indebtedness of the State, and for the payment of the expense of the State, county, and municipal governments, was imposed for many years upon your houses and lands.

In 1876 your representatives in the General Assembly, supported by your hearty encouragement, commenced to check this growing evil.

They were of the opinion that all forms of wealth in this State not exempt from taxation by irrevocable contract or because of considerations of public good, ought to bear their just proportion of the public burdens.

The General Assembly of 1878 and of 1880, influenced by the same convictions, maintained the same policy, and, aided by the wise adjudications of your courts, succeeded in distributing more equally the burdens of the public debt and of the expenses of State, county, and municipal government.

The registration of the voters of this State made by the Republican party under the Constitution of 1864 admitted to the privilege of the elective franchise persons not entitled to vote in this State, and excluded from that franchise a large body of citizens who actually possessed the right to vote. You have endeavored to correct the lists then made by means of the revisions authorized by the acts of 1867, chapter 336; 1868, chapter 297; 1870, chapter 452; 1874, chapter 496; and 1876, chapter 249.

A more thorough method of correction must be applied. The remedy to be adopted is open to debate.

The State Convention declared in 1879 that the General Assembly ought further to secure fairness in elections by providing for a correct and accurate registration by competent officers, at the earliest practicable period of time, of the names of all persons entitled to vote in this State.

The great majority of the Democratic - Conservative members of the General Assembly endeavored to fulfill this obligation.

It is the duty of the convention to insist upon the ample redemption of the pledges given by its predecessor in 1879.

Laws regulating the registration of qualified voters, and laws regulating the conduct of elections at which such voters may cast their ballots, are collectively intended to afford opportunity for the fair expression of the opinions of those who form the elective body of the State. Such laws ought to form part of one well-digested article in the Code.

This convention, therefore, assumes the responsibility of naming a committee, whose duty it shall be to prepare and present to the next General Assembly, at the opening of its session, a complete and impartial system, embodied in one article, providing for the registration of qualified voters, and for the conducting of all elections in this State at which such qualified voters may be authorized to cast their ballots.

The committee shall consist of the Governor and Attorney-General of the State, Charles B. Roberts, of Carroll; Henry D. Farnandis, of Harford; Philip Francis Thomas, of Talbot; and S. Teackle Wallis, of Baltimore City. We ask you to instruct the Senators and delegates whom you may nominate to give their fullest and most cordial aid in perfecting the bill thus presented, and enacting it as a law.

The convention is of the opinion that the interests of public justice require that the methods of selecting the grand and petit juries, of which the greater part of this State has now the advantage, should be by proper legislation extended to those portions of the State which are denied the protection of this improved system.

It is also of the opinion that further changes are necessary in our criminal law to make it completely effective as a means of prevention and punishment.

We, therefore, request those to whom we have deputed the public service of presenting to the General Assembly the draft of a new article in the Code relating to registrations and elections, to add to their duty the framing of such bills necessary to the perfection of our jury system and criminal law as they may have time and opportunity to prepare.

We ask you to instruct your Senators and delegates to give their cordial aid in perfecting such reforms.

This convention expects you to enjoin upon those who may represent you in the Senate and House the duty of reducing the expenses of the General Assembly to the smallest amount compatible with efficient public service, and of regulating such expenditures by positive laws. The services rendered by representatives to their constituencies or to the people of the State are marred, if such agents afford any opportunity for reproach by their negligence or waste in public expenditures.

In conclusion, we now commit to you the conduct of the campaign. It is your duty to select as your representatives in the General Assembly of 1882 the ablest and most respected of those who share your convictions, to the end that your proper influence

may be fully exerted and your purposes be carried into complete effect by the enactment of adequate laws.

The Republican State Convention met at Cambridge on the 6th of October, and nominated Thomas S. Gorsuch, of Frederick, for Comptroller. The resolutions adopted set forth the indissoluble union of the States; the supremacy of the national Constitution and the laws passed in pursuance thereof over any State laws and ordinances passed by any other authority whatsoever; the complete independence of the executive, legislative, and judicial departments of the government, and the rightful supremacy of each in its own sphere; the equality of all citizens before the law; the free and fair expression of the will of the people through the ballot-box; the honest count or declaration of the will so expressed, and the duty of all to acquiesce in the popular will so ascertained; the honest payment of the public debt; the maintenance of the public faith, credit, and honor; a stable metallic base of the country's currency for the security of the people's business and savings, and at par with the monetary standards of the commercial world; an honest, efficient, and economical public service, and its exemption from political fluctuations; the right of the people to have all official positions filled by the most capable and honest, regardless of any other consideration whatever; the promotion of general intelligence, so far as can constitutionally be done, at the public expense; the strict enforcement of laws for the protection of the civil rights, the person and property of the citizen; the promotion of national industry; the development of the national power, wealth, and independence, and the increase of the happiness of the people; that it is the duty of Congress at once to provide an improved method of ascertaining the result of the presidential election, and make further provision for a case of vacancy of the presidential office; also, to revise and make more efficient the laws designed to protect the ballot-box in national elections, and to refuse to admit to seats in that body or to any official position under the national Government any man whose right to such seat or position rests upon or is tainted by bribery, fraud, or violence.

The platform also states that registrations and elections as conducted in Maryland are a burlesque upon republican institutions, and the demand of the Republicans of the State two years ago is repeated, that Democratic higgling with the registration of votes shall cease, and that the Legislature shall in good faith pass such laws as will secure an honest registry, free vote, and fair count; that primary elections be recognized by law, and bribery and other means of fraud punished at legal elections; condemning the creation and continuance of superfluous offices, extravagant salaries to State officials, and prostitution of the public works of the State for the purpose of political corruption as grievous and unneces-

sary burdens upon the people, and asking for a reduction of expenditures; for a system of public schools worthy of the State; for a system of free public roads for better intercourse between sections; a revision of the license law, whereby burdens of taxation shall rest on capital and not as now upon enterprise and industry, and the abolition of distraint for rent; that no debt shall be entitled to more stringent means for collection than that for labor done. The resolutions declare that the leaders of the Democratic party have betrayed the trust reposed in them by their utter disregard of all pledges, and all good citizens of the State are called upon to vote for the Republican nominee for Comptroller, and for worthy men placed in nomination for the Legislature by the Republican party, so that a good and honest administration may be obtained.

MASSACHUSETTS. The legislative session of Massachusetts commences annually on the first Wednesday of January. In the Senate, Robert Bishop was elected President by a unanimous vote; and in the House Charles J. Noyes was chosen Speaker by a vote of yeas 232, blank 1. Soon after a resolution was adopted, appointing a committee to unite with a like committee of the Senate to inform the Governor that both Houses were ready to proceed to public worship. They did so, and reported that the Governor awaited their movement. An adjournment was at once made, at 1.30 p. m., and the Governor with his Council, the members of the Senate, and the members of the House, were escorted to King's Chapel by the First Corps of Cadets, in which the election sermon was preached.

The preacher took for his text the words of Proverbs xxix, 18, "Where there is no vision, the people perish," and said: "The excellent custom which we observe to-day is peculiar, so far as I know, to our own Commonwealth. Connecticut had election sermons for a long period, New Hampshire and Vermont have had a few, and Rhode Island and New York a very few. But in this State the custom has been preserved from the year 1664 to this day."

The session thus begun continued one hundred and twenty-nine days, and closed on May 13th. Three hundred and five acts and seventy-two resolutions were passed. Some of these acts were to the following effect:

The penalties for drunkenness were fixed thus: A fine of one dollar, and such portion of the costs as the court may determine, for a first offense; a fine of five dollars and costs for a second offense; and a fine of ten dollars and costs for a third offense. For second and third convictions the alternative of two months and of one year's imprisonment, respectively, is provided.

The law of 1880, prohibiting at the discretion of licensing boards the maintenance of any obstruction to public view of the premises upon which intoxicating liquors are sold, was made compulsory.

It was also enacted that applications for licenses to sell liquors shall be advertised; that the objection of an owner of real estate adjoining that upon which liquor is to be sold may prevent the issue of a license therefor; that licenses to sell liquors shall be granted only in those cities and towns in which there is a direct vote therefor; that in non-license municipalities club-rooms in which liquors are dispensed or sold shall be deemed common nuisances.

The change of the Constitution proposed by the Legislature of 1880 was concurred in. This provides that no person having served in the army or navy of the United States in time of war, and having been honorably discharged from such service, if otherwise qualified to vote, shall be disqualified therefor on account of being a pauper; or, if a pauper, because of the non-payment of a poll-tax. The act of legislation necessary to submit it to the people at the next State election was also passed. The State thus introduces into its fundamental law a provision that its soldier-paupers may vote without even the payment of the tax to which other people are subjected, when it is at the same time paying \$400,000 annually to prevent the possibility of soldiers becoming paupers.

For the purpose of obviating the evils of double taxation, it was enacted that when any person has an interest in taxable real estate as holder of a mortgage, given to secure the payment of money, the amount of which is fixed and certain, the amount of said person's interest as mortgagee shall be assessed as real estate in the city or town where the land lies, and the mortgagor shall be assessed only for the value of said real estate, less the mortgagee's interest in it, and that savings-banks and institutions for savings, including the Massachusetts Hospital Life-Insurance Company, shall not be required to pay to the Treasurer of the Commonwealth taxes upon such portion of their deposits as is invested in loans secured by mortgages of taxable real estate.

The net yearly income of vessels engaged in foreign commerce, and not the value of those vessels, is hereafter to be taxed.

The tax on deposits in savings-banks and institutions for saving was reduced from three fourths to one half of one per cent.

The bill providing for a direct tax for the current expenses of the State fixed the sum to be levied for that purpose at \$1,500,000, the amount of the same tax for the previous year. Of this gross sum the city of Boston pays \$619,110.

Upon the petitions of many citizens of eminence it was enacted that criminal proceedings may be instituted against a person from whom a divorce has been obtained for a criminal offense; that all decrees of divorce shall, in the first instance, be decrees *nisi*, to become absolute after the expiration of six months from the entry thereof on application of either party; that the court before which any libel for di-

vorce is pending may make such orders and decrees concerning a temporary separation of the parties, the separate maintenance of the wife, and the custody and support of minor children, as in its judgment the interests of the parties and the necessities of the case demand, and that the party against whom a divorce has been or may hereafter be granted shall not marry within two years from the time of the entry of the final decree of divorce; at the expiration of said time said party may marry without petition to the court.

Damages of not less than \$500 nor more than \$5,000 may be recovered by action of tort for loss of a life caused by the negligence or carelessness of a railroad corporation, or by the unfitness for their duties of its servants or employes.

There were also added to the statutes a measure providing that, under a penalty of \$100 for each person thus employed, no railroad company shall place in a position that requires him to distinguish form or color signals any person who has not a certificate from some competent person that he is not affected by color-blindness.

Of the laws relating to the subject of the elections, one provides that there shall be appointed in each voting precinct of the city of Boston, by the mayor, with the approval of the Board of Aldermen, at some time before the first day of October in each year, one warden, one deputy-warden, one clerk, one deputy-clerk, two inspectors, and two deputy-inspectors, qualified voters in the ward of which each precinct forms a part, who shall hold office for one year. Either of said officers may be removed at any time by the mayor, with the approval of the Board of Aldermen, upon written charges of incompetence or official misconduct, preferred either by the city clerk or by not less than six qualified voters of the ward in which the officer is appointed to act. Vacancies are to be filled by new appointments, and deputies are to serve only in the absence of their superiors. It is further provided that upon the petition, in writing, of ten qualified voters, presented at least fourteen days before an election, the mayor shall appoint a supervisor from each of the two great political parties, who shall watch the voting and witness the counting, that no ballots shall be taken from the boxes until after the polls have been closed. By another act registration in Boston is prohibited between the close of registration and the day of the next succeeding election.

Each city that chooses may have a board of registrars of voters, which shall consist of one of its inhabitants, who shall hold no other office, its clerk, and the chairman of its board of assessors.

Upon the affidavit of any legal voter that he believes that a certain person has been illegally registered, investigation of such registration is to be made, and the name of the suspected

person is to be stricken from the lists if it be proved that he is not a legal voter.

The smoking of tobacco or the drinking of intoxicating liquor in a polling-place while an election is in progress, is to be punished by the arrest of the offender, and by the imposition upon him of a fine of not more than \$20.

The sale as butter or cheese, of any imitations of those substances, shall be punished by a fine of \$100, or imprisonment for thirty days, for a first violation of the law, and by a fine of \$200, or imprisonment for ninety days, for each subsequent similar offense.

During the session Henry L. Dawes was re-elected United States Senator. He was born in Cummington, Massachusetts, October 30, 1816; graduated at Yale College; he became a teacher and editor of the "Greenfield Gazette" and the "Adams Transcript"; then he studied and practiced law; and was chosen a member of the Legislature in 1848, '49, '50, and '52; member of the Constitutional Convention in 1853; District Attorney for the Western District of Massachusetts from 1853 to 1857. He was elected to the Thirty-fifth Congress and to each subsequent Congress until the Forty-fourth, when he declined to be a candidate. He was chosen Senator in 1875, and took his seat March 4th of the same year.

The balance in the Treasury at the beginning of the year 1881 was \$3,182,803; the receipts during the year were \$8,576,752 on account of revenue, and \$6,851,359 on account of funds, amounting to \$15,428,111, and making, with the cash on hand, \$18,610,914. The payments were \$8,113,860 from revenue, and \$6,025,102 from funds, amounting to \$14,138,962, leaving a cash balance, on December 31st, of \$4,471,952.

The amount belonging to the sinking funds is pledged for the payment, and is left temporarily in the Treasury on account of the difficulty of securing suitable investments. The amount actually available for the current expenses of the Commonwealth was only \$1,351,639, and the accounts show an actual deficit instead of a surplus. The ordinary expenses of 1881 were \$1,601,501, as compared with \$1,594,174 in 1880; the exceptional expenses \$5,240,875, as compared with \$4,532,258; total, \$6,842,377, as compared with \$6,126,433. But from this must be deducted \$2,243,437 for 1881 and \$2,038,895 from the total of 1880, being the corporation and national-bank taxes returned to cities and towns. This leaves the actual expenses \$4,598,939, as compared with \$4,087,537 in 1880.

The estimated payments for all purposes in 1881 are \$4,337,912; the estimated receipts, including cash on hand, \$4,120,357, showing a deficit of \$217,554. The estimates for 1882 are, payments, \$4,670,905; receipts, \$3,965,334; expected deficit, \$705,570.

Of the expenses in 1881 the following are the principal items:

Interest on the public debt.....	\$1,661,868
Legislative department	204,544
Extra session	88,594
Executive and other departments	80,221
Commissioners: viz., railroad, insurance, harbor and land, fisheries, and statistics of labor.....	60,100
Sundry other commissioners.	18,098
Agricultural department.....	23,707
State printing.....	49,579
Educational.....	79,992
Judiciary.....	184,094
Charitable.....	382,600
Reformatory and correctional.....	827,484
Military.....	181,828
State and military aid.....	418,364
Troy and Greenfield Railroad and Hoosac Tunnel.....	528,263
Prison and hospital loan sinking fund.....	100,000
Consolidation of the general statutes.....	42,450
Improvement of the basement of State-House.....	61,762
Public buildings	67,708

Total..... \$4,456,262

The sources of revenue and their estimated yield in 1882 are as follows:

Corporation taxes, net proceeds.....	\$420,000
Bank-stock tax, net proceeds.....	190,000
Savings-bank tax	1,000,000
Insurance taxes and licenses.....	360,000
State Prison and other institutions, income.....	102,000
Liquor licenses	130,000
Troy and Greenfield Railroad and Hoosac Tunnel.....	275,000
Other fees, and miscellaneous revenues.....	186,695

Total..... \$2,618,695
Add revenue cash in the Treasury

1,851,689

Total..... \$3,965,384

To meet the estimated deficiency under existing laws, including the requisite appropriation of over \$250,000 for the Hoosac Tunnel—being half the estimated expense of completing the tunnel and railroad—with other probable appropriations, a direct tax of \$1,600,000 will have to be levied for the following year.

The reduction of the tax on savings-bank deposits will occasion a large diminution of the revenue. The law, lowering the tax from $\frac{4}{5}$ to $\frac{1}{2}$ of one per cent, goes into effect partly in 1882 and fully in 1883. The tax yielded \$1,613,606 in 1881, and would have produced only \$933,722 under the new law. The increase in the State tax which will be necessary to restore the large amount of revenue thus cut off, which will be felt the more on account of the growing expenditures of the Commonwealth, may lead to the re-imposition of the tax on savings-bank deposits as the most convenient subject of taxation, since the system of indirect taxation is firmly rooted in Massachusetts. The amount of deposits in the savings-banks on October 31st aggregated \$230,444,479, an increase in twelve months of \$12,396,556; the number of depositors was 738,951, an increase of 32,556. There were 165 savings-banks and eighteen co-operative saving-fund and loan associations.

The corporation taxes assessed in 1881 amounted to \$1,976,763, of which \$1,477,408 was the share to be paid over, under the law, to cities and towns. The aggregate capital stock of corporations reported was \$301,724,794, being an increase over 1880 of \$50,159,417; the aggregate value of corporate real estate and machinery, \$166,062,580, being an in-

crease of \$5,387,120. Of the 1,859 corporations attended to, 22 had been dissolved, 39 were in process of dissolution, and 172 were new companies. Notwithstanding the increase in valuation, the amount assessed in 1881 was somewhat less than in the preceding year. The amount realized by the State was \$526,598. The amount of the tax on bank-shares was \$1,647,305. Of \$1,063,771 collected, the balance remaining to the Treasury, after paying \$871,534 to towns, savings institutions, insurance companies, and literary and charitable societies, was \$92,236. The insurance premium-tax amounted to \$132,959. Of life-insurance excess \$195,309 was collected. The Supreme Court has been applied to for a decision on the validity of the latter tax.

Of the public debt, amounting, January 1st, to \$32,799,464, the harbor improvement loan of \$400,000 was paid off in 1881, leaving the principal, on December 31st, \$32,399,464. Of this, \$17,738,966 consist of railroad loans, \$10,468,188 of war loans, and \$4,192,280 of loans for public buildings, etc. The amount of the sinking funds increased during the year from \$13,050,192 to \$14,285,781. The value of the securities held was about \$900,000 in excess of cost, and the value of lands to be sold for the benefit of the sinking funds, and of unsettled credits applicable to this purpose, about \$1,455,000 more; so that the funds amounted to more than half the debt.

The Governor has recommended the Legislature, on the ground of public honor, to provide some method for the Troy and Greenfield Railroad Company to redeem the tunnel and railroad. Under the control of the Commonwealth the works have been nearly completed. The final cost of the Hoosac Tunnel turned out to be nearly fourteen times the original estimate. In the year ending September 30th there were expended on construction account \$345,584, for completing the central shaft, the Greenfield depot, double track over more than half the line, etc. The sum required for completing the double track, and other work to be finished in the next two years, according to a resolve of the Legislature, is \$514,552, as estimated by the manager. The business of the line showed a large increase, though the rates were extremely low, as was the case with all through-traffic. The receipts for the year were \$245,457; the operating expenses, \$183,296.

The Commonwealth still owned in 1881 only a small minority of the New York and New England Railroad stock, and had ceased to control the property. The value of the stock had risen greatly in the market, the prospects of the road were good, and its completion by private capital assured.

The aggregate net indebtedness of municipalities in Massachusetts in each year, from 1871 to 1881, and the total property valuation and percentage of the debt to the same, were as follows:

YEARS.	Valuation.	Debt.	Per-centage.
1871.....	\$1,497,351,686	\$89,421,298	.026
1872.....	1,696,599,969	45,221,745	.026
1873.....	1,763,429,990	58,380,118	.030
1874.....	1,831,601,165	64,904,069	.035
1875.....	1,840,732,728	71,784,006	.038
1876.....	1,769,359,481	72,165,156	.040
1877.....	1,668,226,792	72,049,685	.043
1878.....	1,568,988,210	68,864,685	.043
1879.....	1,529,521,014	67,728,557	.044
1880.....	1,534,756,802	68,512,927	.043
1881.....	1,684,239,976	65,408,691	.039

In the last two years 194 towns diminished their net debt, 78 increased it, and 23 did not change it; 50 towns, which had no debt in 1880, contracted none in 1881; 2 discharged their debts during the year, making 65 towns in the State without indebtedness; and in 46 the percentage of liabilities to valuation had increased. The gross interest-bearing debt of municipalities May 1, 1881, was \$87,352,750; the amount raised in 1881 by taxation for interest alone was \$5,241,165. The aggregate net debt of the municipalities showed for the twelve months a decrease of \$3,104,236. The aggregate local assessment of taxes for State, town, and county purposes for 1881 was \$24,180,245, of which \$1,500,000 was State tax, \$1,093,050 county tax, and \$21,587,195 local tax for municipal purposes, a proportion of 89 per cent. The total amount of sinking funds reported in 1880 was \$18,204,610; in 1881 it was \$19,839,483, an increase of \$1,634,873. Eighty-one towns increased their indebtedness by the amount of \$728,728. For water-works the gross debt was \$29,957,888, for which there were sinking funds amounting to \$3,757,005, leaving a net water debt of \$26,200,883, or 40 per cent of the net indebtedness.

The study and care which have been bestowed in Massachusetts upon prison management and criminal reformation have not prevented abuses in management from being committed, nor serious faults in the system from being retained. The authorities do not, however, neglect this subject, and efforts are continued to bring the system up to the highest standard. The State Prison at Concord has been placed under a new manager, who maintains a firm and humane discipline, and has effected a saving in the cost of the institution. The net cost was \$60,315 in 1878, the first year at Concord; but in 1880 it had been decreased to \$19,289, and the earnings increased from \$66.42 to \$120.98 for each man. The number of inmates in 1880 was 750, a decrease of 20. Of the 150 committed during the year, 96 were intemperate, 68 being of foreign parentage, 21 had been in reform schools, and 75 per cent had a fair education. The number of deaths was 18, of pardons 12. The criminal laws of the Commonwealth have lately been altered, so as to permit longer periods of confinement for habitual criminals, especially such as are of intemperate habits. The judiciousness of such a measure is illustrated by a report of the Boston House of Industry,

which states that, within four months, more than 1,600 persons were re-committed there, of whom hundreds had been sent there twice or three times before, scores a dozen times or more, and three of them seventy times and over. During 1881 there were twenty-four criminals sentenced to the State Prison who had served a previous term there, and some of them three or four terms. The Prison Commissioners have made the recommendation that the system of police supervision which is practiced in European countries be introduced, and professional criminals kept under constant restrictions and surveillance after they have been discharged from prison. The reformatory prison for women at Sherborn is reported as being very satisfactory in its workings. Of the 519 women committed in 1880, of whom four fifths were sentenced for vices of various kinds, only a small proportion were illiterate; 349 were married women; 90 were twenty-one years of age or under, and 294 not above thirty. Of the 456 intemperate women received, only 59 were of American birth. In relation to the project under consideration in the Legislature of establishing a reformatory house of confinement for younger male prisoners, the Commissioners of Prisons stated that, of the 561 prisoners committed to the houses of correction, with sentences of one year or more, 449 were not over thirty years of age, and 129 not over twenty, some of them being as young as fourteen. Under the laws of the State, youthful offenders, when under seventeen years of age, can be sent to the Reform School at Westborough, or to a county prison, except for serious crimes, for which they can be committed to State Prison; if above seventeen years of age, they can only be committed to a county prison or to the State Prison. The courts have been accustomed to send the most promising juvenile offenders, under seventeen, to the Reform School, and the rest to the county prisons. Many young men older than seventeen are sent to the county prisons for from one to three years, and even for terms exceeding three years, the judges being unwilling to degrade them by a felon's sentence. The evil effects of the county prisons or houses of correction, in which the most hardened and vicious criminals are confined, on youths whose characters are not formed, are so striking, and the benefits derived from the enforced discipline and industry so slight, without the influences of education, encouragement, and hope, that a reformatory would be likely to rescue and redeem many of this class from degradation and criminal courses. Another class for which such an institution is considered necessary is that of the younger habitual drunkards, who must be placed under restraint before their habit can be broken, and for whom the houses of correction are inappropriate and harmful in their effects. The reformatory would be still more useful in relieving the Reform School at Westborough of the more incorrigible and vicious boys. For the want of a more suitable place for youthful

offenders, this establishment has been diverted from its original purpose, and turned into a sort of house of correction instead of a school. The failure of the school is patent. Boys are often kept there for six, or eight, or even twelve years, till nearly or quite of legal age, because they are too bad to be discharged or bound out to service. They are not benefited themselves, and they exert a most mischievous influence on their younger companions. The Governor urges a complete change in the system. He proposes that no boy over fourteen be received, and that none be kept there for longer than three or four years. He would give it entirely the character of a school, abolish the prison bars and cells, and have the features of a home; if, after three or four years, a boy proves to be incorrigible, let there be an alternative sentence, with power on the part of the trustees to transfer him to the House of Correction for the remainder of his term; and if he improves during his stay, and a chance is found to place him at useful labor, let him have the opportunity. The number of inmates in the Reform School at the end of the year was only 117.

The insane are increasing rapidly—it is estimated at the rate of 200 a year; and soon the present accommodations will be insufficient. The need of a separate place for the criminal insane, which is strongly urged by those conversant with the subject everywhere, is spoken of by Governor Long, in his annual message, which also recommends a separate asylum for curable cases.

The Statistical Bureau has collated the reports of criminal trials, with the object of determining the proportion of crimes which is attributable to the abuse of liquor. Of the total number of sentences passed by the courts in twenty years, 60 per cent were for offenses directly connected with drinking—that is, for drunkenness, liquor-selling without licenses, etc. The object of the inquiry was to ascertain the proportion of the other offenses traceable to intemperance. In the courts of Suffolk County, during the year ending September 30, 1880, 16,897 persons were sentenced. Of these sentences 12,289 were for offenses directly connected with liquor, 12,221 being for drunkenness, and 68 for breaches of the license laws. The remaining offenses constituted 27 per cent of the total number. The tests for their connection with the use of liquor were (1) whether the criminal was under the influence of liquor at the time of the commission of the crime, or (2) at the time when he formed the intent; (3) whether his drinking-habits or (4) the drinking-habits of others were such as to bring him to a condition which induced the crime; and (5) whether he was an habitual, excessive, or moderate drinker. It appears that 2,097, or 45 per cent, of the 4,608 criminals were in liquor when the various offenses were committed; 1,918 were in liquor when the criminal intent was conceived; the intemperate habits of 1,804

were such as to lead them into a condition favorable to crime, and 821 were brought to such a condition through the intemperance of others. Of the total number convicted 1,158 were total abstainers, 1,918 moderate drinkers, and 1,317 excessive drinkers. Thus, according to these criteria, 84 per cent of all crime was found to be due to intemperance.

The screen law, passed in 1880 as an experiment for the discouragement of drinking, went into effect in 1881, having been made compulsory by an act of the Legislature. It requires dealers in alcoholic refreshments to remove all screens and barriers from the front of bars, so that an unobstructed view of the premises and the persons drinking there can be had from the street. When the act went into force, proprietors of drinking-shops in Boston patronized by the poorer classes at once discarded all obstacles to the view, but in the saloons of select patronage the compliance was only nominal. A sight of the bar could be obtained from the outside by peering intently through the glass doors, which had a single pane of ground glass replaced by a transparent pane, or one of the curtains partly down, or through the half-opened slat-doors, but to passers-by the interior of the saloons, in the day-time at least, was hardly more visible than before.

In the case of *Relia Robinson*, who petitioned to the Supreme Court to be admitted as an attorney-at-law, the court, on September 8th, decided that under the laws of the Commonwealth a woman is not a citizen entitled to admission to the bar. This decision will necessitate legislation to establish the right of women to serve on public statutory boards. The Governor would have railroad companies subjected to strict limitations of their privileges. His suggestions on this subject were as follows:

I earnestly repeat my conviction that a law which permits private property to be taken for a railroad without the owner's consent, and without the decision first made by some impartial tribunal that such taking is a public necessity, is contrary to the Constitution and to justice. It should be amended at once, unless you hold that there are no private rights left which a corporation is bound to respect.

It is generally held in this country that common carriers, including railroad companies, are bound to render to all persons equal service upon equal terms, and that contracts giving to one person lower terms than are given to another for the same service ought not to be permitted on the part of corporations which enjoy their great powers only on the ground of their public usefulness. If the law of Massachusetts differs in this respect from that of other States, as I understand is the decision of our courts, it ought to be amended.

The Massachusetts militia is reported to have attained a degree of efficiency never excelled in the country. The annual cost to the State is about \$132,500, that being the amount expended in 1881. It is proposed to organize a regiment of heavy artillery and drill it in the manning of forts and the use of heavy ordnance, so that it would be of service for the defense of the coast in the event of a foreign

war. No State has such a body, while the entire regular artillery force of the United States is not sufficient to garrison the forts of New York Harbor.

According to the final census returns of 1880, the population of the State, by counties, together with the corresponding figures for 1870, was as follows:

COUNTIES.	1880.	1870.
Barnstable	31,897	32,774
Berkshire	69,032	64,827
Bristol	139,040	102,886
Dukes	4,300	3,737
Essex	244,535	200,843
Franklin	36,001	32,635
Hampden	104,142	75,409
Hampshire	47,232	44,553
Middlesex	317,830	274,333
Nantucket	3,727	4,123
Norfolk	96,507	59,443
Plymouth	74,013	65,365
Suffolk	837,927	270,802
Worcester	226,597	192,716
The State	1,733,035	1,457,351

The increase of population between 1875 and 1880 was from 1,651,912 to 1,733,035, or 131,173, being 63,388 less than the increment between 1870 and 1875, a falling off which is largely attributable to the industrial depression and the stoppage of immigration. The births recorded in 1880 were 44,217, being 3,922 more than in 1879; the marriages 15,538, or 1,736 more; and the deaths 35,292, being 3,491 more. The excess of births over deaths was 8,925, exceeding that of 1879 by 431. The rates for the year were 24·80 births, 8·71 marriages, 19·79 deaths, and 5·01 births in excess of deaths to every 1,000 inhabitants. The birth-rate, though slightly higher than that of the previous two years, is 2·23 per 1,000 lower than the average for thirty years, and lower than any other years except 1863, 1864, 1865, 1878, and 1879. The decrease is greatest in the districts in which there is the least immigration of foreign laborers. The birth-rate is therefore largest in the large towns, varying from nearly 30 per 1,000 in towns of 50,000 population and over, to 16·94 in those of 2,000 and under. There were 105·9 births of males to 100 of females, which is also the average for twenty-five years. The ratio of illegitimate births was much higher among the foreign-born population. The marriage rate was the highest of any year since 1874, but 1·68 per 1,000 less than the average for thirty years. It is nearly 2 per 1,000 greater in the sixteen large towns than in the rest of the State. The average age of 15,501 men married during the year was 28·9 years, and of 13,121 men married for the first time, 26·5 years; of 15,485 women married, 25·1 years, and of 13,956 women married for the first time, 23·8 years. The number of deaths was considerably greater than in any previous year. The rate was the greatest since 1876, ·53 higher than the average for thirty years, ·57 more than the last five years preceding, but 1·3 less than the five

years 1871-'75. The epidemic of diphtheria continued, with some increase over 1879; diarrhoeal diseases of infants caused a much greater mortality than in the previous two years; infectious diseases were more prevalent; and pneumonia was excessively fatal. The death-rate of the sixteen cities was 22.1; of the rest of the State, 18.6. The month in which the greatest number of births occurred was August, which was followed by July, September, December, March, etc., in order. Against 3,584 births in August there were only 2,497 in June. The average age at death varies from 46.34 years in Dukes and Nantucket Counties to 23.34 in Suffolk County. Comparing the reported causes of death in 1880 with previous years, the order of fatality of the twelve diseases producing the greatest number of deaths places consumption at the head, as usual. Pneumonia is second, as it was the previous two years, and in 1874 and 1875; it was third in 1872, 1873, 1876, and 1877, always a leading source of mortality in the State. Cholera infantum, from having steadily fallen from the second place in 1872 and 1873, the third in 1874 and 1875, the fourth in 1876 and 1877, fifth in 1878, and sixth in 1879, has risen in 1880 to the third. Heart-disease, not always an exact term, was, as last year, fourth, having been only sixth to eighth in 1878 and the preceding six years. Diphtheria stands fifth, having declined from the second place in 1876 and 1877, and third in 1878 and 1879; if croup were included with it, the deaths would be 2,394 instead of 1,769, and its place would be third. Old age is sixth, being fourth or fifth previously since 1872. Paralysis is now for the fourth year seventh. Cancer has risen from the tenth, eleventh, and twelfth places to the eighth, as it was also in 1879. "Cephalitis" was ninth in 1880; bronchitis, as in 1879, was eleventh. Typhoid fever showed an extraordinary decline from the fourth place in 1872, sixth in 1873, seventh in 1874, eighth in 1875 and 1876, ninth in 1877 and 1878, to thirteenth in 1879, and has now risen again to the tenth.

The entire Massachusetts insurance for the last five years was \$3,760,583,892, the premiums amounting to \$67,601,667. Of this business, which is about one ninth of that transacted in the other States, the Massachusetts companies transacted nearly one third, foreign companies receiving over \$41,000,000 in premiums.

Under the legislation of 1880, the mutual aid and benefit societies made returns to the Insurance Department in 1881 for the first time, but the great diversity in their modes of doing business renders the statistical collation of their reports difficult. Most of the assessment or co-operative insurance companies are stated to be fair and honest organizations; but others, which can not legally solicit membership in Massachusetts, are notoriously fraudulent in their aims and methods. These companies, against which the commissioners warn the

public, are mostly from two or three Western States and from Pennsylvania.

The Commissioners of Inland Fisheries have in connection with the authorities of New Hampshire placed over a million salmon and California salmon young fry or eggs in the Merrimac in the last five years. They have distributed also nearly a million landlocked salmon among 131 localities, and have placed trout in eleven breeding-grounds in large numbers, and a few carp in forty localities. The building of fish-ways on the smaller streams has been encouraged, and improved models have been substituted for old ones. In their thirty-five ponds, one of which is reserved for experiments, young fish are cultivated in increasing numbers, 100,000 young trout and 300,000 landlocked salmon being ready for delivery to applicants free of charge in the spring. A sufficient number of carp have been secured for breeding purposes to produce hundreds of thousands for distribution in a few years. A controversy has arisen with the Connecticut authorities with respect to the shad-fisheries of the Connecticut River. The fish-way at Holyoke is defective, and the fishermen in Massachusetts are not prevented from taking fish on the spawning-grounds. In reference to these grounds of accusation, the Commissioners make the following explanation:

There can be no question that, had Connecticut shown any disposition to deal fairly in this matter, the Massachusetts Commissioners would have exhausted every means to correct any deficiency in the fish-way, and in that effort would have been fully sustained by the State. As to the sin of taking shad on their spawning-beds, imputed to the Massachusetts fishermen, it should be observed that, no matter where or at what time of the year a fish is killed, its spawn is equally destroyed. The returns show that Connecticut, in 1879, took thirty-two times as many shad as did Massachusetts, and destroyed, therefore, thirty-two times as much spawn, which otherwise would have been deposited in the river. They show conclusively that, while the breeding-grounds are in this State, the catch of fish is almost wholly in Connecticut.

The products of the Cape Cod fisheries for 1881 amounted to \$1,412,000. Provincetown realized \$70,000 from the whaling interests and \$352,000 from codfish; Wellfleet \$171,000 from mackerel, and the Chatham fisheries yielded \$165,000.

The Gloucester fishing fleet in 1881 numbered 437 vessels, being four less than in the preceding season; of these, 343 belonged to the port. The Georges fishery was less actively pursued than in the preceding year. The summer mackerel fleet numbered 149 vessels, 81 of which confined their operations to this fishery. There were 55,430,070 pounds of codfish and halibut together brought into the port in 1881, as against 58,544,450 pounds in 1880, and 53,345,900 pounds in 1879.

The catch of codfish and halibut on the different fishing-grounds visited by the Gloucester fleet was as follows for the three years:

FISHING-GROUNDS.	1881.	1880.	1879.
	Pounds.	Pounds.	Pounds.
Bank codfish	20,955,280	20,247,000	18,247,000
Georges codfish.....	22,510,000	27,511,000	23,144,000
Shore codfish.....	3,245,800	1,721,000	3,742,000
Total codfish...	46,710,580	49,479,000	40,133,000
Bank halibut.....	7,173,800	7,940,000	11,717,400
Georges halibut.....	1,087,400	1,125,450	995,500
Fletched halibut.....	25,000
Greenland halibut...	423,290	500,000
Total halibut...	8,719,490	9,065,450	13,212,900

There were 163,851 barrels of sea-packed mackerel received at the port in 1881, as against 129,620 barrels in 1880. The tale of frozen herring received was 13,318,000, against about 9,000,000 in 1880, and 6,000,000 in 1879. The shore fleet landed in the last five months of the year 1,933,000 pounds of hake, pollock, had-dock, and cusk. The shore herring catch was 8,632 barrels.

The State Greenback Convention assembled at Worcester on August 24th; John Hawes was elected permanent president. The following are the nominations: Governor, Israel W. Andrews; Lieutenant-Governor, George Dutton; Treasurer, George Foster; Secretary, A. B. Brown; Auditor, Wilber T. Whitney; Attorney-General, D. O. Allen.

The Republican State Convention assembled in Worcester on September 21st. W. W. Crapo was chosen president. The number of delegates present was 1,038. The nominations were as follows: For Governor, John D. Long; Lieutenant-Governor, Byron Weston; Attorney-General, George Marston; Secretary of State, Henry B. Peirce; Treasurer and Receiver-General, Daniel A. Gleason; Auditor, Charles R. Ladd.

The nominations made by the Democratic State Convention were as follows: Governor, Charles P. Thompson, of Gloucester; Lieutenant-Governor, James H. Carleton, of Haverhill; Secretary of the Commonwealth, Michael T. Donohoe, of Somerville; Treasurer, William A. Hodges, of Quincy; Auditor, Charles R. Field, of Greenfield; Attorney-General, Patrick A. Collins, of Boston.

The nominations for State officers made by the Prohibition party were as follows: Governor, Charles Almy, of New Bedford; Lieutenant-Governor, John Blackmer, of Springfield; Secretary of the Commonwealth, Solomon F. Root, of Dalton; Treasurer, Thomas J. Lothrop, of Taunton; Auditor, Jonathan Buck, of Harwich; Attorney-General, Samuel M. Fairfield, of Malden.

The result of the election was the success of the Republicans, as follows:

FOR GOVERNOR.	
Long, Republican.....	96,609
Thompson, Democrat.....	54,558
Andrews, Greenback.....	4,889
Almy, Prohibitionist.....	1,649
Total vote.....	157,602
Long's plurality.....	42,023

MATURIN, EDWARD S., died May 25, 1881, aged sixty-nine. He was descended from a French Huguenot clergyman who escaped from France after the revocation of the Edict of Nantes and settled in Ireland. Both the son and grandson of this clergyman were ministers of the Established Church in Ireland. The father of Edward was the Rev. Charles Robert Maturin, curate of St. Peter's Church, Dublin, an eloquent preacher, but more widely known as a poet and romance-writer. One of the most successful efforts of his genius is the tragedy of "Bertram, or the Castle of St. Aldobran," which had an unexampled "run" at that period, being performed one hundred nights at Drury Lane Theatre. The copyright of this production was purchased by Murray for three hundred and fifty guineas, and the play brought the author one thousand pounds. The poet died in 1824, leaving two sons, the eldest William, now rector of All Saints' Church, Dublin, and the youngest Edward, who came to the United States in 1832, with letters of introduction from Thomas Moore, the poet, Richard Lalor Sheil, and other eminent persons in the world of letters. He entered the law office of Charles O'Connor, and afterward of Mr. Logan, as a student, and in due time was admitted to the bar. He had graduated at Trinity College, Dublin, with distinction, and pursued in this country his study of the Greek language and literature. The late Professor Anthon, of Columbia College, recommended him to a vacant professorship of Greek in South Carolina. He resided there for some years, and in 1842 married Harriet L. Gailliard, of that State. Returning to New York, he was engaged as instructor in the Greek and Latin languages and *belles-lettres* in that city for thirty consecutive years. He published several romances, among which are, "Montezuma, the Last of the Aztecs," which was dramatized and met with much success; "Benjamin, the Jew of Granada"; "Eva, or the Isle of Life and Death"; "Roman Tales"; "Lyrics of Spain and Erin"; "Bianca," etc. Mr. Maturin was greatly esteemed for his high moral and social virtues. His deeply rooted religious principles, his remarkable knowledge of the Scriptures, and his high attainments in scholarship drew to him men of noble character. When the Bible Union was formed in 1850, he was selected as one of the corps of revisers, the Gospel of Mark being assigned to him.

MECHANICAL ENGINEERING, THE PROGRESS OF. The improvements which have taken place in the mechanical arts within a few years are not easily appreciated in their full effect and bearings, although the United States have probably contributed more to the advancement in this direction than any other nation. In the annual meeting of the American Society of Mechanical Engineers, at New York, in November, the president, Robert H. Thurston, in his address reviewed some of

the main results of recent progress in mechanical engineering. The improvements in the materials used in construction and mechanical applications form one of the features of this progress which are most likely to escape their proper estimation. The principal changes in the use of materials are the substitution of iron or steel for wood, which has been going on for a long time, and the progressive displacement of iron by steel, which is a more recent development. The expensive and perishable material wood and the weak and brittle minerals are everywhere giving place to iron and steel, while iron is slowly but steadily and inevitably being displaced by steel. Cast-iron in small parts is less and less used as steel castings become more and more reliable, and especially as the art of making drop-forgings of larger size and in more intricate forms is perfected. Sheet-steel, very low in carbon and other hardening elements, is becoming, year by year, more generally adopted in boiler-making, not because of its greater strength, for the stronger grades are always rejected by the experienced boiler-maker, but because of the greater uniformity, ease of working, freedom from cinder, and the durability of those grades which are well suited to such use. A tenacity of less than 65,000 pounds per square inch and great ductility are demanded for this work. In rods and bars, and for sheets to be used where mechanical forces only are present, steel is produced which, with a tenacity of 80,000 pounds per square inch, stretches 25 per cent before breaking. A grade is sometimes obtained very low in carbon, but high in manganese, which has 10 per cent higher tenacity and equal ductility; and the progress seems to be in the direction of a manganese steel as the metal for use in general construction.

In alloys the important service has been rendered by R. H. Thurston of discovering an alloy of copper, zinc, and tin of maximum possible strength, and of pointing out approximately its composition. Other investigators have independently hit upon alloys closely related to this "maximum metal," and possessing properties of hardly less value. It is now known that by carefully proportioning the constituents, by properly fluxing the alloy, and by special mechanical treatment, brasses and bronzes may be obtained having strengths undreamed of by earlier engineers. Tenacities of from 75,000 to over 100,000 pounds per square inch have already been attained.

The introduction of special alloys having extraordinary strength and uniformity of composition, as the phosphor bronzes, manganese bronzes, and sterro-metal, indicate that workers in metal are beginning to enter upon the path long since opened to them by scientific research.

Dr. Fleitman's discovery of a method of making nickel malleable and capable of welding, and his similar improvement of commercial cobalt by the use of magnesium, is in itself

important, and promises to lead the way to further progress.

The effect of variation of temperature in the annealing of iron and steel, and in the hardening and tempering of steel, has long been known. That annealed and unannealed wire differ widely in tenacity and in ductility, that very "mild" steel and good iron are softened by the very process which gives hardness to steel, are familiar facts, and it has been known that there exists a critical temperature, probably definite and fixed for each grade, at which the hardening of steel occurs. Passing this point in cooling the metal takes on its temper, but variations of temperature on either side that point produce no observable effect on its condition, however rapidly they may take place. This critical temperature has now been identified in certain cases, and may prove to be nearly the same for all steels.

The process of cold-rolling has long been known as a method of enormously increasing the strength and elasticity of iron. It is now found that it is applicable to the soft steels; and it seems probable that its full effects may be obtained at any temperature below that critical point which defines the limit of molecular stability in steel. Lanth's process has been applied with equal success to certain alloys of copper and tin, by Sears, in the United States, and later by Rosetti, in Italy, and very extensively and successfully by Uchatius, in Austria. Tobin has cold-rolled bronzes approaching the "maximum" alloy in composition, and has attained tenacities exceeding 100,000 pounds per inch.

A radical distinction has been detected in the behavior of metals under stress, which leads to their division into the iron class and the tin class. The difference is shown in the variation of the normal line of elastic limits by intermitted stress. Engineers are beginning to perceive that that exaltation of the normal elastic limit which is observable in the former class is a valuable quality, the existence of which may justify the use of smaller factors of safety than have hitherto been thought allowable; and this leads to less expense in stationary structures, and to the elimination, to some extent, of stresses due to the inertia of moving parts in machinery. The opinion of many engineers, that moderate static loads may be sustained indefinitely by iron and steel, are also to this extent sustained. The same conclusions lead to the observance of more than usual caution in the use of metals of the tin class, including most of the brasses and bronzes, and to the use of higher factors of safety than are demanded in constructions of iron and steel.

Preliminary straining to secure an elevated initial elastic limit with relief of internal stress is likely to be of service in the applications of iron and steel, as by cold-rolling, by "frigo-tension" and "thermo-tension," and by wire-drawing, while it proves to be probably less effective with other metals.

The experiments made for the Prussian Government by Wöhler and Spangenberg during a period of fifteen years, and concluded eight years ago, are just becoming known to practicing engineers; and Wöhler's law, and Launhardt's and Weyrauch's analyses of results, are found valuable checks upon usual methods of proportioning iron parts of structures. Not simply the load to be applied, but the frequency and the method of its application, and the condition of the structure as determined by earlier strains, must be considered in settling upon its dimensions, and upon the magnitude of the factor of safety. Nevertheless, these quantities are well covered by the factors of safety that have become generally accepted.

Perhaps the most important advance made in the use of materials in engineering has been the general introduction of systematic inspection and careful testing of materials. Such inspection and test is now demanded by every well-drawn specification, and is carried out usually by trained and skillful inspectors. Well-managed establishments have organized departments devoted to the examination and test of materials.

A method of inspection which will safely determine the value of each piece to be put into a structure or machine is becoming adopted; and soon every part of each bridge or machine upon the strength of which depends safety of life and property will have to be proved by actual test before use. The great testing-machine at Watertown Arsenal, set up by the defunct board appointed in 1875 to test iron, steel, and other metals, is at the service of the public.

The consumption of iron and steel is the truest measure of the magnitude and value of the work of mechanical engineering in the United States. The growth of the iron manufactures of the United States has all occurred since A. D. 1700, when there was not a blast-furnace in this country, and principally since the year 1794, when the first steam-engine was erected in America, eighteen years after James Watt made his famous improvements. To-day there are over 1,000 iron and steel works in the United States, employing \$230,000,000 in capital as against \$122,000,000 in 1870-'71, producing 7,250,000 tons of iron and steel, just double the production of 1870, and employing nearly 150,000 men. The value of all products is not far from \$300,000,000, and wages amount annually to about \$55,000,000. In ten years Massachusetts has increased her product 65 per cent, West Virginia 104 per cent, Alabama 890 per cent nearly, Georgia 125, and Tennessee 125 per cent. Pennsylvania holds her place at the head of the list, producing 3,500,000 tons per annum; Ohio makes 1,000,000 tons, New York 600,000, Illinois 400,000, New Jersey 250,000, and other States smaller amounts.

Since 1870 the weight of pig-metal produced has increased from 2,000,000 to 3,750,000 tons

per annum, or 84 per cent; rolling-mills make 2,500,000 tons of rolled iron, an increase of two thirds; the Bessemer steel manufacture has grown from less than 20,000 tons in 1870 to 900,000 tons in 1881; open-hearth steel is now reported at about 95,000 tons, an industry unknown in this country in 1870. Of crucible steel 70,000 tons are made per annum, a gain of 150 per cent in the decade, and its applications are extending day by day.

But Great Britain still remains at the head of iron-making countries, turning out 8,000,000 tons of pig-iron during the year, an increase of one third since 1870, and the increase still continues. The weight of Bessemer rails made has reached above 700,000 tons, and of Siemens-Martin steel 250,000 tons per annum. Germany, France, and other countries of the world exhibit similar gains. Even Italy, where the useful arts have been most neglected, has produced about 300,000 tons of iron-ore, of which a small amount is there worked into finished iron. The artistic sense of her people is seen in the architectural work her blacksmiths make in hammered iron.

The introduction into open-hearth steel-making of the Pernot furnace with its revolving saucer-shaped hearth, and of the Ponsard furnace with its modernization of the ancient process, are the latest steps in the improvement of steel-making apparatus; and the dephosphorizing process of Thomas and Gilchrist, by permitting the use of hitherto condemned ores, will prove a grand step in the reduction of cost of Bessemer steel, which must hasten greatly that inevitable change which will, ere long, replace malleable iron by steel in all of its uses. Good mild steel can at last be made cheaper than good iron. This is the grandest of all the industrial revolutions that have affected the iron-trades; and it will be of hardly inferior importance to the world than was the introduction of puddled iron a century ago.

Steel is employed in every department of iron-work; and that most remarkable of all its many grades, Whitworth's compressed metal, is now at last coming into commercial importance, of which are being made shafts for the largest steamships, and ordnance that has no equal in strength and endurance. Any size desired can now be made in cast-steel, and 100-ton ingots, shaped under 80-ton hammers, are turned out in one European establishment.

The progress of mechanical art is well illustrated by the changes which have taken place in textile manufactures. According to Atkinson, a century ago one person in each family was compelled to work, day in and day out, nearly the whole year, to furnish homespun and dress goods for the rest; to-day, such has been the progress in the introduction of mechanism and automata, that one day's work in the year will, on the average, be sufficient to enable each worker to supply himself with all needed cotton and woolen fabrics. Speeds of cotton spindles have risen, during the last two

decades, from 5,000 to 7,500 revolutions per minute. Looms then making 120 picks per minute make now as high as 160, and one hand takes charge of from 25 to 50 per cent more work. The "slasher" dresser does ten times the work of the old machine, supplying 400 looms in place of 40, and demanding the attendance of only one man and a boy, instead of two men and ten girls. Pickers handle a ton of cotton per day in place of half or five eighths of a ton. The cheaply-made turbine driving these mills has completely displaced the old costly vertical wheel, doing the work with less water and greater steadiness. Its efficiency has risen from 70 or 75 to 80 and 85, and sometimes 90 per cent. A generation ago factories were in operation twelve or thirteen hours; to-day a man works ten hours. Then three yards an hour was the product for a single operative; to-day ten yards per worker are produced. In twenty years the annual product in cotton-mills has risen from $2\frac{1}{2}$ tons to $3\frac{1}{2}$ tons per annum per mill-hand; wages have increased 20 per cent, and the buying power of the dollar has risen in much more than equal proportion, thus adding 50 per cent to the comforts and luxuries of working people, permitting an increased number of happy marriages and comfortable homes, setting free the child-slaves of the mills, and turning them into the schools. Where one hand then drove forty spindles, he now manages sixty; and every seven spindles, of the more than ten millions in operation, work up a bale of cotton each year and turn out a hundred dollars' worth of product. This product is supplied to the most indigent at a small advance on the one and a half cent for labor, and an equal sum for raw cotton, which are expended in the manufacture of the cheapest grades. A still more striking fact is the distribution of American cotton goods to distant countries. A single mill-operative at Fall River, Lowell, or Providence makes each year cotton cloth enough to supply 1,500 of the people who pay by sending their tea.

In woolen manufactures all machinery has been speeded up, product increased, labor diminished, costs lessened, and machinery given greater automatism and higher efficiency both in making ordinary goods and in adaptation to finer grades. The manufacture has had a healthy growth, and the product is daily competing more successfully with the best of imported goods.

Power-looms and automatic machinery have been introduced more slowly in the silk-trade than in others; yet progress has been made. New and improved apparatus is steadily displacing older forms: power machinery is taking the place of hand-worked machines, with more rapidity in mills working the coarser grades, and more slowly where the finest goods are produced. The strength, durability, and finish of all kinds of silks are constantly becoming more and more nearly equal to the

best imported. Some makes of American silk wear better than any of foreign make yet seen in the American market, and several grades have a finish which compares favorably with the very best of European silks. In variety and in quantity of goods produced a steady gain is to be noted. The ingenuity of the American workman, aided by talent and experience coming from the older silk-making provinces of Europe, seem likely to give to this manufacture a position of which its promoters may well be proud. Mr. Wyckoff, Secretary of the Silk-makers' Association, reports, June 30th, a production in the United States of nearly \$35,000,000 in finished goods, by about 400 factories, employing a capital of \$19,000,000, and over 30,000 operatives, whose wages amount to about \$9,000,000 per annum. A half-million spindles are in operation, running often 10,000 revolutions per minute, instead of 5,000 as a few years ago, and over 5,000 power and 4,000 hand looms. Spinning-frames occupy $\frac{1}{100}$ the space, and cost $\frac{1}{10}$ as much per spindle as in the earlier days of the trade, and the cost of work has now become so small that \$3 per pound spent in wages make silk costing \$5 per pound into finished goods averaging \$11.50.

In machine-work generally the distinctively American idea of manufacturing, as opposed to the old methods, of making parts of mechanism in large numbers, is steadily progressing, thanks to the ingenuity of mechanics, like Pratt, Whitney, and others, in devising tools specially designed for the production of definitely limited kinds of work.

The same American genius of invention which produced the Whitney cotton-gin, the Blanchard lathe, the screw-machinery, and the more wonderful card-setting machine, has lately worked out Sellers's automatic gear-cutter, the automatic turret-lathe, and a thousand and one machine-tools hardly less remarkable in construction and efficiency.

In the railroad system of the country changes are everywhere in progress. To-day there are a hundred thousand miles of track laid down in the United States, about one half of the constructed railroads of the world. Trains here and in Great Britain make 50 miles an hour on schedule time, taking water from the track, and receiving and delivering mails, without stop. A speed of 100 miles has been many times attained. Locomotives are frequently built weighing 50 tons; 70 tons has been reached, and every builder of engines is ready to guarantee the performance of an engine to draw 2,000 tons 20 miles an hour on a level track. In coal consumption some saving has been made of late years. Three pounds of coal per hour and per horse-power is the usual duty, and a consumption of 2.6 pounds of coal and of 22½ pounds of steam has been reported from recent locomotive tests. The trapping of cinder and the reduction of intensity of combustion by extending grate area are late im-

provements. The time will come when the nuisance of flying dust and cinder will be unknown. The greatest of all modern inventions in this department, the Westinghouse continuous brake and the Miller platform and coupler, have decreased the risks of journeying by rail to a merely infinitesimal quantity. A train, when at full speed, can be stopped within its own length. Steel rails have driven out iron, and this superior metal is slowly and surely taking the place of its defective rival in boiler and running parts. While Bessemer steel is used for rails, open-hearth steel is coming to be as exclusively used for all parts of the locomotive.

The efficiency of the late styles of stationary engines is illustrated by figures like these: Corliss obtains a duty, as recorded at a 12-hour trial of his last Providence pumping-engine, of 113,878,580, without reduction or allowances, and the average of several days' trial is 112,000,000. Leavitt shows a duty, for months together, of about 105,000,000, and obtains a horse-power with an expenditure of 16½ pounds of feed-water per hour at Lynn and 16.23 at Lawrence. His Calumet engine, with wet steam and but 200 feet piston speed, demands but 18 pounds, and the Hecla hoisting-engine is credited with 16 pounds.*

This figure—sixteen pounds of steam per hour and per horse-power—may be put on record as the very best economy attained by the best engineers at the end of the decade 1870-'80. It is just double the weight which would be required in a perfect engine working steam of the same pressure at maximum efficiency. This leaves still a fair margin for further advance in the construction of the engine. The steam-boiler is at a stand-still; there is but little margin for gain in economy, but a large gain in weight of steam supplied per pound of boiler may be expected when the tardily recognized advantage of forced circulation is secured.

Air and gas engines are competing with stationary steam-engines, but in no other field. The compressed-air engine, the petroleum-engine, and the gas-engine are all just now coming forward. The gas-engine sometimes consumes as little as eighteen cubic feet of gas per hour per horse-power. The solar motor proposed by Ericsson has, as yet, made no progress beyond the plans and experiments of the inventor.

Little has been added regarding the theory of heat-engines to the labors of Rankine and Clausius, except in the minor branches of thermodynamics. In this field the practical work of the engineer is to-day that of seeking, with the aid of the physicist, to determine the facts and the laws governing the exchange of heat

between the working fluid and its inclosing walls. Commercial efficiency is often made a maximum with very much smaller engines, and lower rates of expansion, than are found to give maximum economy of fuel. Rankine was the first engineer to base calculations of economy on the aggregate of commercial considerations instead of regarding only the single aspect of economy in fuel. Thurston, as well as other recent investigators, has applied this method of calculating the efficiency of steam-engines, on which he makes the following observations:

We are not, it is evident, to conclude, from the results of the application of the Rankine method of determining size of engine and maximum commercial efficiency, that we are always to lose so large a proportion of the gain obtainable by further expansion of steam. We conclude, rather, that the engineer must direct his attention to improvements designed to reduce these counteracting wastes. He must find methods of rendering the machine, including boiler, automatic, and thus of reducing cost of attendance; he must find ways of reducing first cost, as by increasing speed and making smaller engines do the work, as by finding ways of building cheaply, yet doing good work, and of making lubrication less costly, or of doing away with it altogether. Automatic firing or stoking, automatic feeds, and automatic cleaning apparatus are already in use, as well as automatic regulation of the engine, of steam-pressure, of point of cut-off, and of chimney-draught. All these improvements, when once made successful and thoroughly reliable, will come in effectively to aid the engineer in this direction, as well as the more direct advances in progress in the direction of reducing back pressure and of checking cylinder condensation, of increasing steam-pressure, superheating, and obtaining by the use of all known methods of high ratios of expansion at maximum efficiency. The engineer and the physicist working hand in hand in the future as they have in the past—or perhaps the engineer-physicist—will sooner or later, following the paths pointed out by Smeaton and Perkins, and in our time by Corliss, Porter, and Leavitt, greatly reduce the now often broad margin between theoretical efficiency and commercial economy. When the engineer has once acquired the habit of gauging the value of an engine by the magnitude of its ratio of expansion at maximum efficiency, all this latter class of improvements will advance with increased rapidity, and when he sees that the magnitude of the ratio of expansion at maximum commercial economy is a gauge of his success in making steam-power useful, the first class of improvements and of inventions will similarly advance, while we shall gladly approximate to mechanical perfection, and this progress will occur at a rate which will be measured by the approach of the two ratios of expansion to the same maximum, finally both becoming nearly coincident with the ratio of maximum efficiency of fluid for each given case.

The compound engine has become the standard type of steam-engine in use on shipboard as well as for stationary pumping-engines. Occasional intimations are heard that a counter-revolution and return to the single cylinder type of engine may be expected, but that change is not observable. The direction and extent of recent advances in marine architecture are readily noted. The proportions of length of ship to breadth remain, as during several years past, about ten to one or eleven to one—about fifty per cent greater than has been considered by some of the best engineers as that giving highest

* This is the more remarkable from the fact that the jackets were disconnected, indicating, apparently, that better work may be done with an underheated than with an overheated cylinder jacket. The performance of the west-side pumping engines at Chicago, giving a duty of nearly 100,000,000 with lower heads only jacketed, is similarly significant.

efficiency. The Great Eastern, 680 feet long, of 83 feet beam, and measuring 25,000 tons displacement, still remains the largest ship yet built; but steamers are under construction for transatlantic lines 600 feet long, of over 50 feet beam, and fitted with engines of 10,000 indicated horse-power. A speed of twenty miles an hour in good weather throughout the voyage, making the distance from land to land in less than a week, may be expected soon to become usual. Double hulls and transverse bulk-heads will make these great vessels safe even against the shock of collision with an iceberg.

Steam-pressure has gradually and steadily risen since the time of Watt, when seven pounds—half an atmosphere—was usual. To-day six atmospheres (75 pounds per square inch) is as usual, and seven atmospheres (90 pounds) is often adopted. Such pressures have compelled the general introduction of the simplest form of steam-boiler—the cylindrical tubular boiler, with large flues beneath the tubes, in which the furnaces are formed. Strength of flues is obtained by the use of heavy plates, sometimes flanged at the girth-seams. "Mild" steel is here slowly displacing iron.

In ordinary practice increase of steam-pressure with correspondingly increased expansion gives, roughly stated, a decreased steam consumption, about in the ratio of the square root of the pressure. This seems true in recent marine engineering; during the past ten years steam-pressure has risen from four and a half to six atmospheres (50 to 75 pounds by gauge), and the consumption of fuel per hour and per horse-power has decreased from 2 to 1·8 pounds. Incidentally the area of heating surface has decreased from $4\frac{1}{2}$ to 4 square feet per indicated horse-power, that is to say remaining, as formerly, nearly 2 square feet per pound of coal burned per horse-power per hour; where, as in some cases, pressures of 100 and 125 pounds are adopted (seven to ten atmospheres, nearly), somewhat further gain may be expected.

Increased pressure has been accompanied by increased speed of piston—from 300 to 500 feet per minute—and both causes have combined to reduce greatly the size and weight of engines. Formerly 500 pounds per indicated horse-power was a common figure; to-day one half that weight is often noted, and in special cases in which, as in torpedo-boats, economy is not important, one fifth and even one eighth those weights have been reached.

Surface condensation is almost exclusively adopted, but the area of cooling surface is becoming less and less, and at the pressure soon likely to become general, the production of a vacuum may possibly cease to be desirable, as it is already known to be with unjacketed cylinders; and the non-condensing engine may yet displace the condensing engine at sea as it has on land, and on the Western rivers where this comparison was earlier made, and where the

evil effects of cylinder condensation were earlier perceived. A still for condensing exhaust and waste steam into feed-water has already been used, and it must remain in use in all salt-water navigation.

Among the most interesting events of the years 1880-'81 have been the trials of the steam-yachts Anthracite and Leila. The first is a small vessel, 86 feet long, 16 feet beam, and 9 feet draught, fitted with a three-cylinder compound engine, and carrying 300 pounds steam (twenty atmospheres, nearly) and upward. Trials in London show these engines to have required but 1·7 pounds of coal and 17·8 pounds of steam per hour and per horse-power. Cylinder condensation amounted to 30 per cent in the first cylinder, and of this nearly three fourths was re-evaporated before discharge from the third cylinder. The same engines tested in this country required 21·6 pounds of steam per hour and per horse-power, the cylinder condensation becoming over 50 per cent, of which four fifths was re-evaporated before reaching the condenser, the difference being probably due to a variation in the efficiency of the steam-jackets and in speed of engines. This little yacht is the smallest that ever crossed the Atlantic. The trial of the Leila, under the orders of the United States Navy Department, was even more instructive than that of the Anthracite. The Leila is a Herreshoff yacht, 100 feet long, 12 feet beam, and measuring 37 tons. With a "coil" boiler, steam at 120 pounds at the steam-chest (nine atmospheres), and driving the boat fifteen knots an hour (seventeen miles), the engines developed 150 horse-power, using but 16·4 pounds of steam per hour per horse-power. The cylinder condensation amounted to but 10 per cent.

An important deduction from the results of the trial of the Anthracite and the Leila is, that efficiency has little relation to size of engine when protection against cylinder condensation is secured. Some of the best work has been done, where non-condensing engines have been compared, by small portable engines. Steam-engines of five thousand horse-power are equalled in economy by engines of one fiftieth that power. A large difference in magnitude seems more than compensated by a moderate difference in steam-pressure. The highest pressure may prove least economical when the engineer neglects to provide against loss by cylinder condensation. It is found more and more necessary to discover some means of making the interior surfaces of steam cylinders of non-conducting material. That accomplished, the cost of power, in quantity of steam used, will be reduced from ten to fifty and more per cent, according to the kind of engine considered. Until that is done, superheating, steam-jacketing, and high speeds of piston must be relied upon to give high efficiency; but only perfectly adiabatic expansion can give maximum economy of steam. The

error of assuming that the condensation of steam due to transmutation of heat into work produces the principal part of the water observed in the cylinders of engines working dry steam, is becoming recognized. Later writers hold that the greater part of the water which collects in unjacketed cylinders is not produced by liquefaction of steam during its expansion, but that this latter amount is insignificant, and that this water comes of cylinder condensation, sometimes with considerable leakage, and often amounts to a half or more of all the fluid supplied by the boiler. This defect, existing in all heat-engines, will probably soon be remedied to such an extent as no longer to constitute the great obstacle to further advance. The trials of steam-engines, now often conducted by the Forey & Donkin method of measuring the heat rejected, afford a reliable means of measuring actual efficiencies. Recently, Eckart has applied the chronoscope of Hipp to the determination of the exact velocities of piston in mid-stroke. There is a prospect that the precise action of steam in the engine and the causes of variation in efficiency will be better understood. The progress which has been made in naval engineering during a generation illustrates the advances observed in nearly every other department. Naval works, whether in the civil or the military marine, have become almost purely the work of the mechanical engineer. The ship-builder constructs his ships of iron and steel; their lines are laid down by the laws of engineering science; their parts are formed in the machine-shop and put together by the same methods that are adopted in constructing their boilers. They are driven by steam-engines; and even their loading and the discharge of their cargo have become matters of engineering. The old-fashioned mariner is rapidly disappearing, and the engineer is likely to become the responsible officer on the voyage, as during construction. The daily advance noticeable in naval construction is a progress leading directly and rapidly toward bringing all naval warfare within the province of mechanical engineering. A generation ago, the French line-of-battle ship *Napoleon*, with her 100 guns and 600 horse-power engines, represented the most formidable of naval vessels. A little later, in 1856, the American *Wabash* class of screw-frigates, with fewer but much heavier guns, was thought to be the coming type. Then the modern ironclad came to revolutionize all naval warfare. The engineers Robert L. Stevens and John Ericsson, and the naval architect Edwin J. Reed, led the way to the construction of the war-ship of to-day, a craft carrying ordnance weighing from 25 to 160 tons, at speeds varying from twelve to sixteen knots; plated with from fourteen to thirty inches of armor, and yet penetrable by their own guns.

Navies are coming to be divided into three classes of ships, and an independent service of torpedo-vessels: 1. A class of vessels for service in time of peace, of moderate size and

speed, carrying a few heavy guns, unarmored and with great sail-power; 2. A class of unarmored ships of very high speed under steam and carrying a light battery, such ships as might be best calculated to destroy the commerce of an enemy; and, 3. A class for heavy fighting, carrying the heaviest of guns and the most impenetrable of armor, with as high steam-power as possible, and rendered, by division into compartments, as nearly unsinkable as possible. Owing to the introduction of the stationary, the floating, and the automatic classes of torpedoes and of torpedo-vessels, the attack by any navy of stationary defenses is now quite a thing of the past; and torpedo-ships of very high speed may yet drive all heavily-armored vessels from the ocean. The production of such craft as the *Polphemus*, making seventeen knots, and Ericsson's *Destroyer*, with its great submarine gun, and the self-propelling torpedo, guided from the shore, indicate that the day of cessation of all naval warfare is not far away.

In gunnery, stronger and safer ordnance metal, breech-loading in place of muzzle-loading, increased velocity of projectile, a flatter trajectory with less lateral drift, and with enormously increased range, are the changes now occurring. Whitworth's compressed steel, Krupp's breech mechanism and skillful design and construction, have given guns capable of driving shot at velocities of over 1,200 feet per second with small-arms, and nearly 2,000 feet with heavy ordnance. Whitworth, with a comparatively small piece, has attained a range of nearly ten miles. The machine-guns of Gardner, as built by Pratt and Whitney, and the Gatling and others, as constructed by the Colt Company and the Ames Manufacturing Company, firing a thousand shots a minute, have rendered the old methods of warfare, in which large masses of troops were deployed in the open, entirely obsolete, while the accuracy of sharp-shooting at ranges of 1,000 yards or more make the use of any unprotected ordnance at short ranges extremely difficult. Hollow cast guns, as made by Rodman, although the best cast-iron ordnance ever known, are now of the past; and even the Armstrong, the Woolwich, and other guns built up in the forge, fail, when made of eighty and one hundred tons weight, and must give place to solid steel guns. Improved methods of making explosives and better adjustment to the work by variation of composition, and especially size and density of grain, has enabled artillerymen to keep pressures much below twenty-five tons per square inch, while greatly increasing the energy developed per pound burned and correspondingly increasing the effectiveness of ordnance. The theoretical energy of good powder is about 250,000 or 300,000 foot-pounds per pound. In experiments, an actual result equal to two thirds is now obtained. There is still much to be done in perfecting ordnance, especially in its construction, and as yet ordnance officers

are completely at sea in respect to systems of construction of large guns. Treadwell and Woodbridge have pointed out one direction of progress by the application of the strongest known form of metal, hard drawn steel wire, in building up the barrel, and Whitworth has shown what can be accomplished with steel in masses. The gun is already a heat-engine of high efficiency, but thermodynamic investigations show that this gas-engine may be made still more efficient. A gun in which the charge expands twenty-five times should give to the shot an energy of 300,000 foot-pounds per pound of good ordinary powder, and such a standard must sooner or later be closely approximated. As the heat is generated and expanded in a very small fraction of a second, the gas expands adiabatically, and the loss of efficiency comes from incomplete expansion. The tendency of improvement is to have guns lengthened greatly, and carefully proportioned to their work. Recoil is considered to be in many cases often an avoidable evil with breech-loading guns. It is expected that with the improvements in progress guns can be held fast against recoil, and thus the defect in efficiency will be entirely avoided. Increased accuracy and power with flattened trajectory and reduced drift will come with these improvements, and the last will give much greater convenience and safety in working, and will aid still more in the effort to unite guns and supporting structure as closely and firmly as possible.

That feature of recent progress in engineering which is awakening most interest in the minds of the public as well as of the profession is the introduction of machine-made electricity, and of the electric light. The prospect of the use of the electro-dynamic machine as a distributor of power is a more momentous consideration than its use as a generator of light. The mean of several series of tests of a powerful dynamo-electric machine from Menlo Park gave, as a result, an efficiency of between 90 and 95 per cent.

This important advance in that field in which the mechanical engineer and the electrician have joined hands, will lead to the probable early success of the electrical railway, a promising scheme of simplifying the problem of transportation on elevated railways; and it is not unlikely that the rising generation may see the introduction of this method of distributing power from a central source in the great cities, and even from Niagara, with its 3,000,000 horse-power, to distant cities. The competition of this method of distributing light, heat, and power, with the already practical plan of steam distribution introduced by Holly, of Lockport, and now coming into use in New York city under the direction of Emery, will be watched with unusual interest.

The improvements in the control and application of electric energy render the prospects of aerial navigation far less problematical. In

the science of *aéronautics* progress, although slow, is still to be observed year by year. During the Franco-German War the French naval engineer, M. Dupuy de Lôme, succeeded in giving to the balloon a slow motion by means of a screw, and in directing its course by a rudder. His balloon was spindle- or cigar-shaped, and contained 12,000 cubic feet of gas. It could carry fourteen men, and the screw was worked by four or eight men. But the only hope of aerial navigation lies in the direction of flying-machines, lifted by their own power, not buoyed up by gas. Men of science, like Pettigrew, Marey, and De Lucy, have studied the motions of the wings of birds and insects, have learned the laws of fluid resistance, and have paved the way to a real advance. Weight is probably not objectionable in aerial navigation, but volume constitutes the impediment. Comparing the lady-bird, the stag-beetle, the pigeon, the stork, the sparrow, etc., De Lucy found the area of wing per unit of weight carried to be nearly as the cube root of their weights. A man of ordinary weight should, therefore, be able to fly with wings having an area of only about forty square feet. De Villeneuve states that a bat having the weight of a man would need wings only ten feet long. Marey has made birds in harness record graphically the motions of their own wings; and Houghton and Marey and others have determined the working power of muscles in proportion to weight and size, and the method of movement of muscles and wing. Henson, Stringfellow, May, and others have made self-impelling model flying-machines, some of which have actually lifted themselves in the air, and several of which have flown with great speed when once lifted clear of the ground. The most remarkable achievement is that of Henson in making a steam-engine, fragile to be sure, but still a working machine, producing a third of a horse-power, and weighing less than fifteen pounds. Still, there is as yet but little on which to base an expectation of finding a satisfactory yet powerful motor.

The introduction of the power-press and the gradual incorporation into one automatic machine of the web-perfecting press of Sir Rowland Hill and of Jephtha Wilkinson's, of Worms's cylindrical stereotype plates, of Richard Hoe's type-cylinder and double-acting fly-frame; of Applegarth's enlarged impression-cylinder, and of minor improvements, have led to the creation of the modern printing-press. To-day a daily paper can be printed at the rate of 30,000 impressions an hour, each paper printed on both sides, cut from the great roll in which it came to the press, pasted in shape and folded exactly to size, and then counted off by the machine as delivered to the carrier. The work of the compositor is likely to be greatly accelerated by the type-setting machine, which has attained extraordinary perfection. Paige's machine receives a column of "dead matter" from the press, distributes it automatically,

sets it up anew at the rate of 3,500 ems per hour, including setting, justifying, and distributing, which is five times the work of the unaided hand. Its type lasts longer than when set by hand, and every defective or turned type is thrown out by this mechanical automaton.

The cause of public technical education finds in the President of the Society of Mechanical Engineers an earnest advocate, as is seen from the following concluding remarks in Mr. Thurston's annual address:

But the individual must be taught, not simply permitted to learn as best he can. Education, directed effectively with the object of giving, in least time and at least cost, a preparation for all the duties coming to the learner, whether in daily toil or in social life, is called for; trade-schools must be incorporated into the common-school system, and technical and professional colleges and great universities of science and art must be placed beside the older academies of learning. And this need is most felt by our own colleagues, and by the people employed by them. He who would accomplish most in the profession of the mechanical engineer, or in the trades, must best combine scientific attainments—and especially experimental knowledge—with mechanical taste and ability, and with a good judgment ripened by large experience. He must be carefully, thoroughly, and skillfully taught the principles of his art in the technical school, and the practice of his profession in office or workshop.

We have been late in seeing this necessity, and must suffer for our dullness as a nation; but we are beginning to open our eyes and to move in this most vital of all the duties of citizenship. One and two and three centuries ago, wise men like Pascal and Worcester and Vaucanson saw this greatest, highest duty of governments and citizenship, but it is only recently that we, as a people, have come to see its importance.

But now, the magnificent trade and technical school system of Germany, the older if less complete educational system of France, the tardily begun but splendid later work of Great Britain, and the grand beginnings made in the United States, form a glorious commencement of a revolution that shall peacefully effect such changes during the next generation as, probably, no one can realize until after their actual accomplishment.

With trade-schools in every town, technical schools in every city, colleges of science and the arts in every State, and with a great technical university as a center for the whole system, we shall yet see all combined in a social organization that shall insure to every one absolute freedom to learn and to labor in any department of industry, with absolute certainty of a fitting recompense for all the zeal, intelligence, and good work that the worker, whether man or woman, may offer the world.

MEDICAL SCIENCE AND PRACTICE:
ITS PROGRESS. The meeting of the International Medical Congress, held in London during the first week in August, 1881, afforded a fitting occasion for the review of the progress that has been made in medical science and practice during the past generation. Several of the speakers at the Congress, accordingly, referred to the present condition and the prospects of the science, and represented them as very hopeful. The president of the body, Sir James Paget, said that "it will not be easy to match the recent past. The advance in medical knowledge within one's memory is amaz-

ing, whether reckoned in the wonders of the science not yet applied, or in practical results, in the general lengthening of life, or, which is still better, in the prevention and decrease of pain and misery, and in the increase of working power." Professor Virchow said that "we have reached the point which denotes the boundary between ancient and modern medicine"; and "we may now say with satisfaction, on looking back at a period which we have ourselves lived through, and which comprises little more than a generation, that there never before was a time when an equally great zeal in investigation, or anything approaching to a similar advance in knowledge and ability, has shown itself among physicians." Professor Huxley, remarking upon the disappearance of older definitions of life, observed that the connection of medicine with the biological sciences appeared to be more clearly defined. And Professor Volkmann, speaking of the changes which surgery had undergone within the past ten years, said: "Great and unparalleled in the history of medical science have been those changes. Problems, thousands of years old, have been solved, or are, at any rate, approaching a sure solution; the desires of our fathers have been fulfilled beyond their hope and expectation."

Medicine has been very slow in defining its position among the sciences, and can hardly yet be declared to answer a rigid definition of a science. It is, nevertheless, scientific both in spirit and doctrine; and if the existence of a real science of medicine can not yet be maintained, medicine is certainly rooted and grounded in science. It has become recognized as a part of the science of biology, and may be, in some sense, described as the applied science of biological doctrine. "It is so difficult," says Professor Huxley, "to think of medicine otherwise than as something which is necessarily connected with curative treatment, that we are apt to forget that there must be, and is, such a thing as a pure science of medicine—a 'pathology' which has no more subservience to practical ends than has zoölogy or botany. The logical connection between this purely scientific doctrine of disease, or pathology, and ordinary biology, is easily traced. Living matter is characterized by its innate tendency to exhibit a definite series of the morphological and physiological phenomena which constitute organization and life. Given a certain range of conditions, and the phenomena remain the same, within narrow limits, for each kind of living thing. They furnish the normal and typical characters of the species; and, as such, they are the subject-matter of ordinary biology. Outside the range of these conditions, the normal course of the cycle of vital phenomena is disturbed; abnormal structure makes its appearance, or the proper character and mutual adjustment of the functions cease to be preserved. The extent and importance of these deviations from the typical life may vary in-

definitely. They may have no noticeable influence on the general economy, or they may favor it. On the other hand, they may be of such a nature as to impede the activities of the organism, or even involve its destruction." In the first case, these perturbations are styled "variations"; in the second case, they are called lesions, states of poisoning, or diseases, and, as morbid states, lie within the province of pathology. No sharp line of demarkation can be drawn between the two classes of phenomena, and all that can be said is, that whatever change of structure or function is hurtful belongs to pathology. Hence, pathology is a branch of biology—the morphology, the physiology, the distribution, the etiology of abnormal life.

"The search," says Professor Huxley, "for the explanation of diseased states in modified cell-life; the discovery of the part played by parasitic organisms in the etiology of disease; the elucidation of the action of medicaments by the methods and the data of experimental physiology—appear to me to be the greatest steps which have ever been made toward the establishment of medicine on a scientific basis." Medicine, however, has presented two aspects—the scientific and the empirical—the difference between which lies in the very nature of things. While there is so much that is unknown in the study of medicine, there must be empiricism in its practice. Knowing little or nothing of certain processes of disease, it is guided by broad results, and that is empiricism. Knowing, from previous investigation, something of certain other processes, it is guided by its knowledge of their causation, and that is scientific medicine. The possible area of empiricism can be more circumscribed only with the advance of biology; and, with the better means thus afforded to test and investigate its assertions, they will be the more quickly reduced to scientific expression. Medicine thus can claim an independent existence as a practical science—not, of course, independent of biology, but taking rank as one of its distinct and integral divisions. Intimately related to its sister-divisions, and freely giving to and borrowing from them, it yet lives and works in a sphere of its own.

Pathology, in the sense that it is the morphology of abnormal life, is pronounced by Professor Huxley the analogue of the theory of perturbations in astronomy; and from this point of view therapeutics resolves itself into the discovery of the means by which a system of forces competent to eliminate any given perturbations may be introduced into the economy. And, as pathology is based on normal physiology, so therapeutics rests upon pharmacology, which is, strictly speaking, a part of the great biological topic of the influence of conditions on the living organism. Most hopeful indications of the progress of medicine are derived from a comparison of the state of pharmacology at the present day with that which

existed forty years ago. If we consider, Professor Huxley says, the knowledge positively acquired, in this short time, of the *modus operandi* of urari, of atropia, of physostigmin, of veratria, of cascra, of strychnia, of bromide of potassium, of phosphorus, "there can surely be no ground for doubting that, sooner or later, the pharmacologist will supply the physician with the means of affecting, in any desired sense, the functions of any physiological element of the body. It will, in short, become possible to introduce into the economy a molecular mechanism which, like a very cunningly contrived torpedo, shall find its way to some particular group of living elements, and cause an explosion among them, leaving the rest untouched."

The advancement of medicine within the last generation has been marked, first, in its development from within of its own art and science; secondly, in its adaptation and absorption of means and principles of other arts and sciences; and, thirdly, in the simple adoption and application of material from external sources, and may be considered under all of these heads. In the first branch of the subject absolute progress has been made in our time in pathology, or the knowledge of the nature of diseases, in the study of their signs and symptoms, or semeiology, and in their treatment, or therapeutics.

The most important step in pathology has been the adoption of Virchow's doctrine of cell-growth, to which the largest proportion of recent progress has been directly or indirectly owing. Great and important in itself, and in its influence on biology generally, it has little less than revolutionized pathological study. In its light pathological anatomy has been studied as affording the efficient explanation of morbid processes; the structure of the tissues and organs in which disease prevails has been exposed, and a distinct structural basis has been given to our knowledge, if not of the disease itself, of the morphological result of the disease, which has yielded a precision and definiteness such as no other conception could yield; new light has been thrown upon the clinical recognition of morbid processes; forms of disease which were semeiologically indistinguishable, but pathologically distinct, have been discriminated and individualized; specific varieties of the same type of disease have been recognized from their commencement, and distinguished throughout their course; constant phenomena previously remarked have been elucidated; large and important classes of morbid processes, before hardly recognized, have been demonstrated; the processes of every disease have been investigated, with general increase of knowledge; prognosis has been given certainty and definiteness, and it has been possible to make an exact interpretation of the morbid signs observed. A tendency has been manifested in late years to supplement the analytical method, which, useful and necessary as it is, had been carried to an extreme, and

had caused the direction of too great a degree of attention to details and single symptoms, with a synthetic or constructive method, under which a disposition has arisen to regard disease in a larger and more comprehensive manner; to view more prominently the relation of morbid tissues and functions to the organism generally; to emphasize less the variations than the constitutional form of the disease; and "to recognize, in some way or another, the indefinable 'life' which is hardly known to pathological anatomy." Under this synthetic spirit the study of the ancient doctrine of humoral pathology, which seeks for the causes of disease, or of its first effects, in the fluids of the body, has been revived. Recent progress in pathology has, therefore, been most largely due to microscopic study. Substantial and important aid has been given by organic chemistry, but that science has not probably fulfilled the expectations it excited some years ago, and seems hitherto to have occasioned some disappointment. Only the ultimate results of morbid processes can, as a rule, be recognized by chemical tests too far removed from the processes themselves to throw much light upon them, and their application to pathological conditions is so ambiguous that no safe deductions can be drawn from such tests. Pathology has also received little aid from therapeutics.

By the establishment of a common basis of elementary morbid lesions occurring in every part of the body, the same morbid processes are seen to take place in different structures of the body, with primarily the same effects, which are modified only by the function and character of the tissue of the part involved. The abnormal increase of connective tissue in the structure of any organ, for instance, ends in contraction, compression, and obliteration of the structural elements, with consequent loss of function. Inflammation occurring in any tissue leads to effusion, extravasation, and supuration. All the elementary processes of pathology may be seen in different tissues and organs, producing the same effects, only that the effects are manifested in a manner peculiar to each part; with the same fundamental lesion the disease is the same essentially, although wholly distinct in appearance. Since the great bulk of disease can be resolved into these fundamental processes, a scientific and durable foundation for pathology is established which is of the highest value and significance for philosophical medicine. Under this view, diseases of different organs, which, until their essential elements were demonstrated, appeared to have nothing in common, are now seen to be results of the same process. Thus, a great tendency may be observed at work toward the codification and unification of disease, and the resolution of complex forms into the simplest elements.

Pathology as a science has also made a great advance in the discovery of the microphytic origin of certain specific diseases. Several af-

fections of this class have been shown to be caused by the development of minute organisms within the system; and it is affirmed that septicæmia has been traced to *septic bacteria*, relapsing fever to the *spirilla*, ague to the *bacillus malaria*, leprosy to the *lepra bacilli*, tuberculosis to the *tubercle micrococcus*, splenic fever to the *bacillus anthracis*, and the condition termed "chyluria" is caused by a nematoid known as the *filaria*. The multiplication of such organisms in the blood, and their consequent aggregation in the spleen, supplies a satisfactory explanation of the salient phenomena of diseases of this class; and it is naturally inferred that other affections of a similar type have a like origin.

The more recent development of the microphytic or germ theory of disease is exemplified by the researches of Drs. Klebs and Tommasi Crudelli into the cause of the malarious properties of the Roman Campagna, which they have traced directly to an organism (the *bacillus malaria*) inhabiting the soil; and in the researches of Professor Klebs and Dr. Schüller, which have indicated a micrococcus spreading rapidly in the blood and tissues as the probable cause of tubercular and serofulous diseases. M. A. Laveran has made a report upon certain forms of organisms which he has found in the blood of patients suffering from malarial diseases, while he has not noticed them in other persons, the remarkable susceptibility of which to the influence of quinine may go far to account for the potency of that medicine in such diseases. Experiments made by Krebs, Tizzini, and Bruntlecht to determine a microphytic origin for typhoid fever have resulted in the discovery of organisms which they have associated with the cause of that disease, but they are not yet regarded as fully conclusive. Drs. H. C. Wood and Henry Formad, acting in co-operation with the National Board of Health of the United States, have made experiments in relation to the transmission of diphtheria, the results of which indicate that that disease is also caused by micrococci which may exist within the system in different degrees of activity—moderate in ordinary sore-throat, intense and malignant in diphtheria.

On the other hand, M. Bouchardat, acting under the direction of the municipal authorities of Paris, has examined the sanitary effects of some of the mephitic odors with which that city has been troubled, and has concluded that they are not seriously injurious in the absence of microphytic germs, unless the gases that occasion them are present in such bulk as to operate as poisons. A commission has also been engaged in Paris in the examination of the effect of cemeteries on the public health, and has found that under all ordinary conditions of good management they are free from the deleterious qualities that have been popularly ascribed to them. It is not denied, however, that cemeteries may be so carelessly kept as to become dangerous.

Other illustrations of the progress that has been made in the sedulous and laborious study of forms of disease are afforded in the case of nervous disorders, which are now traced to general changes taking place in other parts of the system; and those processes have been connected with certain signs by which they are recognized clinically. Even in psychological medicine insanity has been demonstrated to be the result of definite cell-change. The smallest degree of progress has been made in what are termed the general diseases of the system; but, among these, diseases of the blood-elements have received certain definite explanations—gout has been elucidated in its chemical results, and diabetes has been studied as a question of physiology but little as a disease, while of tetanus, chlorosis, and scrofula “but little more is known than the descriptions of Hippocrates tell.”

Great and wide progress has been made in the study of the signs and symptoms of disease. A definite value and explanation have been given to the symptoms, and the signs of disease have received their true meaning. A direct effect of disease has been observed as the natural center for a group of symptoms, which, without such explanation, were isolated and unintelligible. While local lesions have been clearly defined, the “constitutional” effects have been more observed; and these effects, always recognized as they have been by signs to which a purely empirical value was attached, are now measured with the certainty of scientific observation. The relations of the topical disease to the whole system—usually the main inquiry in each case—are thus determined.

The study of disease by the methods of investigation represented by the stethoscope, ophthalmoscope, thermometer, and by urinoscopy, has been elaborated and formulated to an extent which the authors of those methods did not dream of. Through them a certainty and precision are afforded to certain signs which must in all cases be inquired into, but which, before the use of such means, were most vague and undefinable. Electricity, also, has been made to contribute materially to the more precise determination of the general effects and conditions of disease; and other means, of smaller and more limited scope, have assisted to build up a broad basis of semeiology which is of the utmost value because it supplies a positive estimate of the vital powers and the constitutional relations of local disease that are fundamental factors in every case, and could otherwise only be vaguely guessed.

The study of children's diseases has been greatly accelerated by the multiplication of hospitals for children. Thirty years ago there was not a single hospital set apart for children in England and America, and investigation in this branch of the science could be pursued with any degree of success only in Paris. Now, London has several special children's hospitals, and similar institutions are established

in every large town in England, while children's wards have been provided in most of the large hospitals. Nearly the same is the case in the United States and Germany, and almost everywhere throughout Europe the opportunities for the study of the diseases of children are almost as numerous as for the diseases of adults. The fruits of the labors that have been pursued under the advantages thus afforded may be counted with satisfaction. The vague phraseology which served for years to conceal ignorance respecting the affections of childhood has been, to a great degree, done away with. Physicians no longer talk of worm fever, remittent fever, gastric fever, etc., as distinct diseases, but recognize under these names the one disease, typhoid fever, varying in severity, but marked always by its own characteristic symptoms. Half a page in a hand-book was all that was to be found, thirty years ago, concerning heart-disease in childhood; while at the present day the frequency of heart-disease has been fully recognized, and it has been studied with as minute a care in the child as in the adult. The various inflammations of the respiratory organs are no longer looked on as a whole, but each is referred to its proper class. That once almost unrecognized disease, diphtheria, has been studied with the greatest care; its relation to membranous croup has been investigated, and the close connection of the two has been demonstrated. Much light has been thrown on the various diseases of the nervous system. The so-called essential paralysis of infancy has been traced by the researches of Messrs. Roget and Damascino to its proper source, and the pseudo-hypertrophic muscular paralysis of Duchenne has been the means of affording a new and important addition to our knowledge of the pathology of early life. Corresponding advances have been made in the therapeutics of children's diseases.

Physicians and surgeons have gained knowledge concerning the relation of the various organs of the body and their affections, the value of which is beyond estimation, from investigations pursued on animals; yet the opposition to vivisection is maintained with unabated zeal. The duty of the state to encourage rather than discountenance researches of this kind was admirably presented at the International Medical Congress, by Mr. John Simon, who maintained that all that we know or can know of the causes of disease is, and must be, learned by experiment. He showed that the experiments that instruct us on the subject are of two kinds: scientific experiments, carefully pre-arranged and comparatively few, performed in pathological laboratories, and for the most part on other animals than man; and “the experiments which accident performs for us, and, above all, the incalculably large amount of crude experiment which is popularly done by man on man under our present ordinary conditions of social life.”

Thus, in regard to Asiatic cholera, we have the scientific infection experiments of Professor Thiersch, and others, performed on a few mice; and, on the other hand, the popular experiments which were performed on a half million human beings in London, during the cholera epidemics of 1848-'49, and 1853-'54, by the water companies. M. Villemin has gained information of incalculable value concerning the causes and nature of tubercle from his laboratory experiments on other animals than man, and has been followed by others who have extended and developed his discoveries. Professor Gerlach, of Hanover, has, in a similar manner, studied the transmissibility of tubercle from animals to man by eating their flesh and drinking their milk. The popular experiments, performed by milk-dealers serving their customers, which lead us to suspect that tuberculosis might be transmissible through milk, are performed daily upon thousands of human beings. The scientific experiments which have made us certain of the fact were conclusive when they amounted to half a dozen. Thus, without making any account of the relative value of human beings and animals, the scientific experiments are vastly more economical than the popular. They have the further advantage of being precise and exact, while the popular experiments very often have in their sources of ambiguity which lessen their usefulness for teaching. The principal problems to be solved in preventive medicine are how, by cross-breeding or otherwise, to convert a short-lived or constitutionally enfeebled stock into a long-lived or vigorous one, which has hardly yet become a practical question; and how to avoid or resist the extensive interferences which shorten life, on which much has been learned by vivisection, and much remains to be learned. Of the investigations in the latter line, which have led to results of momentous value, are cited the diversified researches of Pasteur and others on germs, and their specific applications to the diseases of domestic animals and man; Drs. Klebs and Tommasi Crudelli's examinations into the intimate cause of marsh-malaria; Dr. Grawitz's studies of the conversion of ordinarily harmless microphytes into agents of deadly infectiveness; Dr. Lister's applications of Pasteur's discoveries to the antiseptic treatment of wounds; Professor Semmar and Dr. Krajewski's discovery of inoculation against septicæmia; and Dr. Schüller's contributions to the treatment of tubercular and scrofulous affections, on the basis of their microphytic origin. No work has been performed of more promise to the world than these various contributions to the knowledge of disease, its cure and prevention; and they are contributions which, from the nature of the case, have come, and could only have come, from the performance of experiments on living animals.

The controversy about vivisection which is now going on, though at first sight appearing

like a retrograde movement, will, in all probability, end in a substantial advance of the interests of medicine. The public, including even the mass of the opponents of vivisection, have only to be properly informed of the immense service it has been made and may yet be made to render to the health and happiness of mankind, to be willing to give to suitably qualified experimenters all the liberty of research they require. The present contest is, in most of its aspects, a repetition of the old battle which was formerly waged against the dissection of human bodies. Many of the stock-arguments which were then employed in opposition to the direct study of human anatomy are now made to do duty over again against the study of physiology through the analogies exhibited in the structure of animals. Now, as then, discussion is destined to result in enlightenment, and vivisection will eventually be recognized as a legitimate method of investigation.

The most important step in therapeutics, and probably the most important in the whole history of that branch of the science, consists in the adoption of a definite physiological aim in the use of remedial measures, of the practice of administering medicines with a definite purpose to produce a distinct physiological effect, instead of employing particular drugs with a vague idea that general favorable results have been remarked from their use. This principle is the necessary result of the clearer definition of disease and of the action of drugs. When the aggregate symptoms presented by a disease were analyzed, one generally assumed a causal relation to the others which singled it out as the object of therapeutical attack. Or, again, the urgency of certain symptoms, or the irremediable character of the essential lesions, rendering other treatment of no avail, gave a purely symptomatic aim to the whole plan of treatment. The principle of this method is that no true progress in therapeutics can be made if more than one drug is employed, since a favorable result can be attributed to no single drug—so that only a single drug is to be administered for a single intention. Where no definite therapeutic indication can be observed no drug is to be used. This is the modern justification of "expectant" treatment. But disease is seldom a single pathological condition, with a single essential symptom, which a single remedy can relieve. The latest tendency in therapeutics is to revert cautiously and partially to the combination of remedies, still following pathological indications, but not submitting the whole plan of treatment to a single dominant symptom; and this tendency may be plausibly referred to the more constructive or synthetic mood which seems of late to have come over medicine. It may be illustrated in the modern treatment of consumption, in which, in place of the sedative treatment that sent sufferers to a moist, relaxing climate, a stimulating and bracing plan of open-air life has been adopted. The former method was

the treatment of symptoms—that is, of the cough; the latter is the treatment of the essential disease, by improving the constitutional powers. There can be no doubt of the value of the one-drug treatment of disease, nor that it is strictly scientific and has largely contributed to the advance of therapeutics. It is essentially the definite basis of therapeutics, and, in appropriate cases, gives the chief successes of medicine. But where disease is a complex condition, the treatment must also be complex; and, even where a single cause can be defined, its effects and results give to the affection a complex character.

Improvement in the methods of treatment of the insane has been manifested in the discarding of the system of mechanical restraint, and the substitution of judicious mental control; in the tendency to prefer for all classes of patients public to private institutions, which is illustrated by a bill that was introduced into the British Parliament in 1881, to facilitate the extension of the privileges of the public institutions to private patients; and in the increasing esteem with which the treatment of lunatics in private families is regarded.

The essential aim of therapeutics may be stated as being the induction of a physiological process for the remedy of disease. The more nearly this induced process assumes a definite chemical or dynamic form, the more positive and direct is its action; and recent advance has greatly tended toward the statement of many therapeutical problems in chemical or mechanical terms. At the same time, the influence of the nervous system is so constant and direct in every process of the body, that these problems must always be distinctly physiological, and can not be stated as purely chemical or mechanical. The nervous element is, however, neutralized as an interrupting element, in many cases, by its very constancy, by reason of which it is present alike on either side of the equation, both in cause and effect. But if therapeutics has been thus simplified in one direction, it has made use of more complicated physiological processes in another direction. Some of its most certain and remarkable effects are obtained by acting upon the nerve-centers in the brain and spinal cord, by which these effects are normally induced. Nervous influence is thus subordinated to, in place of disturbing, the therapeutic plans. Very striking in this connection are the results obtained by the precisely localized and measured action of heat and cold upon the central nervous system.

The growing identification of therapeutics with physiology is also seen in the hygienic treatment of disease. Not only are hygienic measures used for general purposes of advantage, but distinct applications of hygiene are employed for a distinct physiological effect. Schemes of dietetics, for instance, are not only used with negative precautionary aims, but with positive remedial intentions. By the

prevalence of certain climatic conditions, natural or artificial, physiological states of the body are induced, and may be calculated upon as distinctly curative. Exercise may be so ordered that particular secretions and processes shall be stimulated, while others are unaffected. This mode of treatment has largely displaced the use of drugs, and has greatly diminished the expectation of specifics, if not the desire for them.

The advance of chemistry has produced some new remedies of importance, which have not, however, been derived from the organic side of the science. No connection has been traced between the chemical composition of the essential principle of a secretion and a chemical remedy; and while chemical stimulants and depressants have been demonstrated for every organ, their action has not been explained by any law of chemical or physical constitution. The rule established by Rabuteau, that the therapeutic energy of soluble metallic salts is in direct ratio with the atomic weight of the metal contained in the salt, suggests probabilities of the enunciation of such laws in the future.

The relation of electricity and disease has been well investigated; a precise code of electro-therapeutics has been established, and clear results of considerable value have been obtained; but it can not be said that electricity has been as successfully applied in the remedial as in the diagnostic section, and a feeling of disappointment in regard to its influence on disease has been produced.

Important advance has been made in the principles of the administration of drugs, especially in the matter of their application to the part they are designed to affect as directly as possible. By the subcutaneous injection of the active principle of drugs, the effect is more localized and less constitutional disturbance is produced than when the administration is by the mouth. Moreover, the remedy acts more quickly, and enters sooner into the general circulation; and the risk of decomposition before absorption, which is incurred by admixture with the digestive fluids, is avoided. The method of direct application is also exemplified in the inhalation of suitable substances by smoking in a pipe or cigar. So much doubt has been cast by physiology upon the absorbing power of the skin, that external treatment by lotions and ointments has been greatly restricted.

Special study has been given to the employment of anesthetics. A considerable number of substances have been used more or less extensively, and their physiological effects have been closely compared. A smaller quantity of the inhalant has been found to be sufficient, and happier results—in view of the slight danger to life incurred in ordinary inhalations—have been obtained by the method of "mixed narcosis," or the subcutaneous injection of narcotics before the administration of the in-

halent. The more correct principle of local anæsthetization, in which the disturbance of the system is avoided, has been successfully adopted in the application of the freezing effect of the ether-spray. The physical and mental quietude induced by inhalation must, however, always keep a place for it in appropriate cases.

Modern surgery has shown a tendency to become more conservative—to dispense with the knife, and rely more upon the recuperative and compensatory capabilities of the body; and in this respect has distinctly approached medical practice. Medicine, on the other hand, is tending toward the adoption of manipulative measures; and thus the line of demarkation between the two branches of the healing art is becoming more and more faint. Such departments as obstetrics, and affections of the eye, ear, larynx, and skin, are both medical and surgical; and the two branches are inseparably blended in the general study of disease, as is exemplified in the introduction of instrumental means of diagnosis and treatment, the object of which is to bring diseased structures within manipulative reach. By the invention and improvement of means of this kind, our generation has made much disease of internal structures to be seen, felt, and handled. Thus has arisen a large body of special knowledge and practice around many organs. The eye, ear, and larynx, for instance, have respectively a peculiar art and science. It is not to be expected that specialisms of this character will die out of medicine. As the study of each organ increases in extent and profundity, and the treatment of its diseases and defects becomes more complex and delicate, special talent and culture will always be recognized. Recent progress in the "special" developments of practice has been sound and sure, in so far as it has traced its researches on sound pathological principles.

Of the relations of some of these special investigations to general medical practice, Dr. George Johnson said, in his address before the section on Diseases of the Throat, that among the most interesting and important of the scientific and practical gains which have resulted from the use of the ophthalmoscope and the laryngoscope, "is the fact that, by the inspection respectively of the interior of the eye and of the larynx valuable light is often thrown upon the diseases of remote but physiologically correlated organs. If, for example, the ophthalmoscopist sees in the eye a retinitis significant of renal disease, a neuritis indicating cerebral tumor, or an embolism the result of valvular disease of the heart, so, in like manner, the laryngologist is often led by the observation of the paralytic or spasmodic condition of one or more laryngeal muscles to the diagnosis of a general neurotic condition to which the term hysteria is often applied, or of a special local disease in the nervous center, or, it may be, of a tumor, cervical or intra-

thoracic, pressing on the pneumogastric nerve or its branches. It is obvious that all clinical facts of this kind, indicating, as they do, the interdependence and the close physiological relationship between various tissues and organs, are of great scientific and practical importance. There is reason for the belief that the more thorough and profound is the investigation of any disease or class of diseases, the more numerous and intimate will be found to be the relationship with other morbid states."

Of the modern development of surgery, Surgeon John Eric Erichsen remarked: "The continuous advance in our art is undoubted. The gain that thus results has been definitely secured to surgery and to mankind. It can never be lost. Every conquest that has been made has been permanent. Year after year some new position has been won—often, it is true, after a hot conflict of opinion. But, once occupied, it has never been abandoned. Thus our stand-point has ever been pushed on in advance."

Modern conservative surgery is marked by the care that is taken for saving blood in operations, which is strikingly in contrast with employment in former practice of bleeding to subdue or prevent inflammation attendant upon surgical treatment. By the new practice of the excision of diseased joints in cases where the whole limb would formerly have been removed, an arm or leg can be preserved with a degree of impairment of movement that makes it only less useful than the limb before it was diseased. Resection has of late years come to be extensively applied in the treatment of cases of articular disease which formerly were subjected to procedures of a less heroic character—a course the expediency of which, Dr. Erichsen suggests, should be well weighed before it is entered upon. The most important advance in surgery is the adoption of the antiseptic process and the rigid exclusion of the surrounding air from wounded surfaces. Whether all putrefactive processes in wounds are caused by the development of living organisms, as is generally believed, or partly result from other poisonous agencies, concerning which some differences of opinion may still exist, a substantial agreement prevails that the use of antiseptics renders innocuous certain poisonous matters which are met with in a wound exposed to the air. The effect is practically the same if the purification of the air is attained by thorough sanitary measures. Professor Volkmann said of the antiseptic method in his address before the International Medical Congress: "By rescuing from the domain of chance the results of our labors, . . . the antiseptic method has elevated surgery to the rank of the latest experimental science. Never has a discovery been made in surgery which has even approached this in its benefits to humanity in general. . . . To-day we may say, with the deepest conviction, that the surgeon is responsible for every disturbance which oc-

curs in a wound; that it is his fault if even the slightest reaction or redness is developed in it, or if an amputation is not healed by first intention"; and, speaking of the simplification of processes that has attended the employment of this method, he remarked that "it would appear that in association with anæsthetics and the bloodless method antiseptic surgery has deprived all important operations of their terrors." While for the forty years previous to the adoption of the antiseptic treatment fatal wound-diseases raged, patients with compound fractures most frequently died of them, and even those with the slightest injuries often succumbed to them, and erysipelas and abscesses were matters of daily occurrence, and during later years hospital gangrene became very prevalent and fatal, now, operations are conducted which would have been regarded then as madness, or as crimes; and even young doctors are able with impunity to venture upon operations which the most daring surgeon did not think of. While Dr. Volkmann and his predecessor in the hospital with which he is connected had experienced a loss of forty per cent of the cases of compound fracture that they had treated, and Dr. Volkmann's last cases before he adopted the antiseptic treatment had all died of pyæmia or septicæmia, he has since lost none from wound-diseases and only two from other causes out of 135 cases of compound fracture, and only four or five per cent in direct consequence of the operations out of 400 cases in which the larger limbs were amputated. Thus amputation of the larger limbs has become almost free from danger; certainly less dangerous than many small operations were formerly, the mortality of which was never discussed. The adoption of the antiseptic system has made it possible to counteract the noxious qualities of the "infected air" of hospitals, and to perform operations in the most crowded institutions of large cities almost as safely as in the open country. With the aid of the new method, operations of an increasingly formidable character are carried on with diminished mortality and almost assured safety, and are made to confer life and health upon thousands who must otherwise have suffered for years or have miserably perished. Among the most striking operations of this kind may be named the extirpation of deep-seated and important organs, such as the pancreas, spleen, kidney, and thyroid gland; the removal of a part of the stomach and pylorus by Billroth, and of a part of the small intestine by a surgeon of Strasburg, both with perfect recovery. The operation of cutting for stone has been practically abolished since the introduction of Bigelow's method for crushing the stone and securing its removal by natural ways, at a single operation, a method which Dr. Erichsen says has effected a complete revolution, and has wholly changed the character of lithotritry, and which, he adds, there is every reason to believe "constitutes one of those real advances

in a method which marks an epoch not only in the history of the operation itself, but in the treatment of the disease to which it is applicable." The larynx has been more than once successfully removed and replaced by an artificial voice-organ; and the use of the laryngoscope has made the easy removal of morbid growths and foreign bodies an every-day proceeding. In regard to the treatment of aneurisms, the ligature and compression still have their partisans, and improvements in either process seem to keep pace with those in the other. Compression was most in favor a few years ago. The invention of improved ligatures, made of various kinds of animal tissue and applied with antiseptic precautions, once more inclined the balance of professional opinion in their favor; but now again the practice of compression has received renewed strength from the employment of Esmarch's elastic bandage. Wounded joints are now freely opened and successfully treated. Among new operations in plastic surgery may be named skin-grafting, and the transplantation of the cornea of the eye.

In the category of the development of medicine by the adoption and absorption of means and principles of other arts and sciences, may be placed the adoption of new drugs whose action has been investigated, either by physiological experiments or by study of their chemical effects. The isolation of the active principle of a drug is a decided approximation to scientific precision; but the clinical gain from this source is not always indubitable, for the entire drug is often seen to act with more advantage than the simple alkaloid, even though the alkaloid is practically the therapeutic power of the drug. It is not yet clear whether this difference is due to the chemical or molecular condition in which the active principle is present in the plant, or to the modifying influence of other slightly powerful substances. The vegetable kingdom has supplied the great bulk of the recent additions to the list of drugs, and chemistry has given some most important remedies, but the animal kingdom, where many favorite remedies were formerly found, is now hardly regarded. A great power has always been recognized in the enlightened practice of hydropathy, but it can not be said that its therapeutic function has as yet been definitely established. Good results have been obtained in the application of gymnastics for its decided remedial value in particular affections as well as, and quite distinct from, its beneficial effect as exercise and in the culture of the physical powers. Many nervous and muscular disorders, and other disorders in which the main defect seems to be in the controlling power of the brain, are certainly benefited by such treatment; and the brain can often be thus educated so as to establish a normal functional action in the place of one that is aberrant or altogether wanting. The study of climatology has been carried on without yield-

ing definite results respecting the nature of the relations between climate and health or disease.

Under the head of development by the adoption and application of material from external sources, come the application of "drugs which are used with beneficial effect, but to which no particular place or value in medicine has been assigned; methods which have been employed with advantage, but have not received a distinct medical function to discharge; instruments of decided utility, but which have not been adopted as part of the regular procedure of practice; theories which look very like truth, but have not been positively demonstrated. The great characteristic of this category is its state of incessant flux and change."

Speaking generally, it may be said that the tendency of our generation in medicine has been constructive or synthetic, in contrast with the infinitesimally analytical spirit of its earlier years. In pathology the great mass of disease has been reduced to a basis of elementary morbid lesions, modified only by the function and structure of the organ in which they appear. In semeiology, the measurement of the extent of the impairment of the vital processes supplies the basis for a definite estimate of every case of disease. In therapeutics, general constitutional treatment increasingly supplants the tinkering of one or two symptoms only; and when the affection can be resolved into a single radical symptom, the remedy often attains the positiveness and completeness of a physiological demonstration; while still broader principles of hygiene frequently supersede entirely all other therapeutic measures. Medicine also recognizes more and more that its care is for health as well as for disease, to prevent as well as to cure, and, observing that the beginnings of disease are often in more or less avoidable violations of the conditions of health, seeks to prevent these violations. Under this policy, results of the most striking and important character have always been obtained in what is termed public hygiene. Even by the rudimentary practice of sanitation, which as yet alone obtains, the most terrible forms of disease have been banished. The plague and leprosy have practically disappeared in every civilized country, and other diseases have assumed a much milder form. With more efficient sanitary measures, the diseases caused by specific poisons, such as small-pox, typhoid, hydrophobia, etc., will, in all probability, entirely disappear.

From statistics of medical literature, which were presented to the International Medical Congress by Dr. John S. Billings, it appears that the contributions to medicine properly so called (excluding from the category popular medicine, pathies, pharmacy, and dentistry) form a little more than 1,000 volumes and 1,600 pamphlets yearly. The "Index Medicus," for 1879, shows that the total number of new

medical books and pamphlets, excluding periodicals and transactions, published in that year, was 1,643, divided as follows: France, 541; Germany, 364; United States, 310; Great Britain, 182; all other countries, 246. Besides these, 693 inaugural theses were published in France alone, to say nothing of those that appeared in other countries. Periodicals form about one half of the current medical literature, and constituted, in 1879, 655 volumes. Of these the United States produced 156 volumes, Germany 129, France 122, Great Britain 54, Italy 65, and Spain 24. This is exclusive of journals of pharmacy, dentistry, etc., and of journals devoted to medical sects and isms. The whole number of volumes of medical journals and transactions of all kinds was, for 1879, 850, and for 1880, 864. The total number of original articles in medical journals and transactions published in 1879, which were thought worthy of notice in the "Index Medicus," was a little more than 20,000. Of these, 4,781 appeared in American periodicals, 4,608 in French, 4,027 in German, 3,592 in English, 1,210 in Italian, 703 in Spanish, and 1,248 in all other periodicals. The number was nearly the same in 1880. It thus appears that more articles of this class are published in the English language than in any other, and that the number of contributions to journals is greatest in the United States. The actual bulk of periodical literature is, however, greatest in Germany, owing to the greater average length of the articles. The list of authors shows that the number of physicians who are writers is greatest in proportion to the whole number in the profession in France, and smallest in the United States.

METHODIST ŒCUMENICAL CONGRESS. An Œcumenical Methodist Congress, in which all the Methodist Churches of the world were represented by delegates, met in the Wesleyan Chapel in City Road, London, September 7th. The Congress was composed of four hundred delegates, consisting of ministers and laymen in equal numbers, of whom two hundred were allotted to the Methodist Churches of Great Britain and the colonial and mission churches immediately affiliated with them, and two hundred to the churches of the United States and Canada. The allotment among the churches severally was as follows: Wesleyan Conference (Great Britain), 88 delegates; Primitive Methodist Church, 36 delegates; United Methodist Free Churches, 22 delegates; Methodist New Connection, 12 delegates; Bible Christian Church, 10 delegates; Wesleyan Reform Union, 4 delegates; Irish Wesleyan Conference, 10 delegates; French Wesleyan Conference, 2 delegates; Australasian Wesleyan Methodist Connection, 16 delegates; Methodist Episcopal Church, 80 delegates; Methodist Episcopal Church, South, 38 delegates; African Methodist Episcopal Church, 12 delegates; African Methodist Episcopal Zion Church, 10 delegates; Colored Method-

ist Episcopal Church, 6 delegates; Methodist Protestant Church, 6 delegates; Evangelical Association, 6 delegates; United Brethren Church, 2 delegates; American Wesleyan Church, 4 delegates; Free Methodist Church, 2 delegates; Primitive Methodist Church in the United States, 2 delegates; Independent Methodist Churches, 2 delegates; Congregational Methodist Church, 2 delegates; Union American Methodist Episcopal Church, 2 delegates; Union African Methodist Protestant Church, 2 delegates; Methodist Church of Canada, 12 delegates; Methodist Episcopal Church of Canada, 4 delegates; Primitive Methodist Church of Canada, 2 delegates; Bible Christian Church of Canada, 2 delegates; British Methodist Episcopal Church, 2 delegates.

The Rev. George Osborn, D. D., President of the British Wesleyan Methodist Conference, presided at the opening meeting. A new presiding officer was appointed for each subsequent day. The introductory sermon was preached by Bishop Matthew Simpson, D. D., LL. D., of the Methodist Episcopal Church, and embodied a sketch of the rise and progress of Methodism. The regular discussions of the Congress were begun on the second day, September 8th, with the consideration of the general topic of "The grateful Recognition of the Hand of God in the Origin and Progress of Methodism," under which were included papers on "Methodism; its History and Results," by the Rev. N. Cooke, D. D., of the Methodist New Connection; "Some Statistical Results of Methodism," by the Rev. Arthur Edwards, D. D., of the Methodist Episcopal Church; "Methodism a Power, purifying and elevating Society," by the Rev. William Arthur, of the British Wesleyan Methodist Connection; and "The Influence of Methodism upon other Ecclesiastical Bodies, and the Extent to which they have modified Methodism," by the Rev. A. W. Wilson, D. D., of the Methodist Episcopal Church, South; with invited and voluntary addresses by various speakers on each of the topics. The subject of the "Evangelical Agencies of Methodism" was considered on the third day in papers on "The Itinerant Ministry," by the Rev. S. Antliff, D. D., of the Primitive Methodist Church; "Lay Preachers," by the Hon. J. W. F. White, of the Methodist Episcopal Church; "Women and their Work in Methodism," by the Rev. F. W. Bourne, of the Bible Christian Church; "Scriptural Holiness and the Special Fitness of Methodist Means of Grace to promote it," by the Rev. J. P. Newman, D. D., of the Methodist Episcopal Church. The general subject of the "Training of Children" was discussed on the fourth day with papers on "The Training of Children in Christian Homes, so as to bring them to Christ, and attach them to Methodism," by the Rev. Joseph Wood, of the Primitive Methodist Church; "The Training of Children in the Sunday-School and Church so as to secure the largest Evangelical Results," by Dr. H. A. Thompson; and "Sun-

day-Schools and Evangelical Denominational Results," by G. J. Smith, J. P. Papers were read on the fifth day on "The Relation of Methodism to the Sabbath," by the Rev. John Baker, of the Wesleyan Methodist Connection; "The Relation of Methodism to the Temperance Movement," by Bishop D. A. Payne, of the African Methodist Episcopal Church; "Juvenile Temperance Organizations and their Promotion through the Sunday-School and Church," by the Rev. Charles Garrett, of the Wesleyan Methodist Connection; and "Civil Measures to suppress Intemperance, and the Relation of the Church to such Movements," by the Rev. J. M. Walden, D. D., of the Methodist Episcopal Church. The papers read at the sixth day's session were on "The Probable Perils of Methodism from the Papacy, from Sacerdotalism, and its Connected Errors," by the Rev. J. Guttridge, of the United Methodist Free Churches; and on other perils to Methodism "From Modern Skepticism," by the Rev. Daniel Curry, D. D. (read for him in his absence), of the Methodist Episcopal Church; "From Formality, Worldliness, and Improper Amusements among our Members," by the Rev. J. W. McKay, D. D., of the Irish Wesleyan Church; and "From Innovation upon Established Methodist Usages and Institutions," by Bishop Joseph P. Thompson, of the African Methodist Episcopal Zion Church. The topic for the seventh day was "Education." The papers were on "The Higher Education demanded by the Necessities of the Church in our Time," by the Rev. J. G. Osborn, of the Wesleyan Methodist Connection; "The Duty of the Church to maintain Schools which are Christian in their Influence and Character," by C. G. Andrews, D. D., of the Methodist Episcopal Church, South; "The Education and Special Training of Ministers in Theological Institutions," by the Rev. W. B. Pope, D. D., of the Wesleyan Methodist Connection; and "Education and Special Training while engaged in Ministerial and Pastoral Work," by the Rev. E. J. Badgeley, of the Methodist Episcopal Church. Papers were read on the eighth day on "The Use of the Press for the Advancement of Christianity," by the Rev. T. S. Withington, of the United Methodist Free Churches; "The Newspaper and the Use to be made of it by the Church," by the Rev. C. K. Marshall, D. D., of the Methodist Episcopal Church, South; and "Methodist Hymnology," by the Rev. G. Osborn, D. D., of the Wesleyan Methodist Connection, the Rev. J. M. Buckley, D. D., of the Methodist Episcopal Church, and others. The subject for the ninth day was "Home Missions and Benevolent Work." The papers were on "The Maintenance of Home Missions among the most Degraded Populations," by the Hon. John MacDonald; "The Important Work the Methodist Laity have performed in the Direction of Home Missions, and the Great Opportunities which they have in the Future," by T. H. Bainbridge, Esq.; "The Best Means

of reaching the Unconverted Sections of the Richer Classes," by the Rev. S. B. Southerland, D. D., of the Methodist Protestant Church; and "Methodism and its Work for Orphans, for the Aged, and generally for the Dependent Classes," by the Rev. T. B. Stephenson. The tenth and eleventh days were devoted to the subject of "Foreign Missions." The papers were on "The Results of Methodist Missions in Heathen Lands," by the Rev. J. M. Reid, D. D., Missionary Secretary of the Methodist Episcopal Church; "How to avoid Waste, Rivalries, and Confusion arising from Different Methodist Bodies occupying the Same or Contiguous Fields," by the Rev. J. H. Rigg, D. D., of the Wesleyan Methodist Connection; "The Establishment and Support of Training-Schools for Native Converts and Native Ministers in the Foreign Field," by the Rev. W. H. Potter, D. D.; "The Use of the Press in Non-Christian Countries for the Promotion of the Gospel," by the Rev. J. S. Banks; "The Missionary Work required in Papal and Semi-Infidel Nations," by the Rev. A. Sulzberger; and "The Resources of Methodism for the Work of the World's Conversion, and the Duty of developing and employing those Resources," by the Rev. C. C. McKetchnie. The Congress was closed on the twelfth day, with the discussion of the topics: "How Christian Unity may be maintained and increased among Ourselves and made Manifest to the World," by the Rev. A. C. George, D. D., of the Methodist Episcopal Church; "The Catholicity of Methodism," by the Rev. J. Myers; and "Methodism as a Bond of Brotherhood among the Nations," by the Rev. David Allison, D. D.

The readings of the papers were all accompanied by a number of invited and voluntary addresses by members of the Congress, in which delegates from all the bodies represented took part; and the readiness of the representatives of the colored churches to participate in the discussions was particularly remarked.

Resolutions were passed during the meetings, recognizing the good which had resulted from closing the liquor-shops in England on Sundays; taking notice of the extraordinary opening in France for evangelistic work, and of the success which had already attended its prosecution there; expressing appreciation of the successful work of the Women's Home and Foreign Missionary Societies; commending all

well-directed efforts to substitute arbitration or other forms of amicable and peaceful reference instead of war in the settlement of all international difficulties; recognizing the usefulness of the Christian women who are engaged in providing orphanages and homes for the aged and worthy poor, and in other forms of philanthropic work; declaring the growth and manufacture of opium for sale in China "under the direct sanction of the British Government, and virtually as a Government monopoly," to be "a serious obstacle to the spread of Christianity in China, and injurious to the credit and influence of England throughout the civilized world"; and expressing sorrow for the death of President Garfield, of the United States. Replies were adopted to fraternal addresses of the United Brethren Church and of the General Council of the Presbyterian Alliance. Resolutions were passed favorable to the holding of a second Ecumenical Congress in the United States in 1889, and requesting the several Methodist bodies to create a joint executive committee, which should have power to determine the place and time of holding the meeting, the number of delegates, their allotment, and the programme of exercises to be followed. In addition to the regular meetings of the Congress, three evening meetings were held at Exeter Hall, at which representations and addresses were made on the condition and progress of Methodism in America, Australia, and the East; and a general temperance meeting was held. A call, bearing the signatures of a number of delegates of the several Methodist bodies represented at the Congress, has been published recommending the holding in 1884 of a meeting commemorative of the centennial of the organization of Methodism in the United States, to be composed of representatives (clerical and lay) from all the Methodist bodies in America.

METHODISTS. The following is a summary of the statistics of the Methodist Churches of the world, as given from the latest published reports in the "Methodist Year-Book" (Phillips & Hunt, New York) for 1882. The numbers for the Methodist Episcopal Church are to July 1, 1881; those for the Methodist Episcopal Church, South, are for 1880; those of the Canadian, British, and Affiliated Conferences, for 1881. In two or three of the churches the numbers of local preachers are estimated:

METHODIST ORGANIZATIONS.			
	Itinerant ministers.	Local preachers.	Lay members.
I. EPISCOPAL METHODISTS IN THE UNITED STATES:			
Methodist Episcopal Church.....	12,142	12,323	1,717,567
Methodist Episcopal Church, South.....	4,004	5,868	837,531
African Methodist Episcopal Church.....	1,582	9,760	391,044
Methodist Episcopal Zion Church.....	1,050	3,750	* 200,000
Colored Methodist Episcopal Church.....	633	638	† 112,300
Evangelical Association.....	912	611	118,871
United Brethren.....	2,196	157,585

Number of Sunday-school scholars.....	1,592,062	1,570,515	21,544
Number of officers and scholars.....	1,811,324	1,791,027	20,297
Number of presiding elders.....	445
Number of mission superintendents.....	16
Number of pastoral charges left to be supplied.....
Number of local preachers stationed as pastors.....

The "Minutes" of the conferences for 1881, the publication of which was completed in February, 1882, give the following totals for

the calendar year: 11,807 traveling preachers, with 1,218 preachers on trial; 159,764 probationers and 1,553,340 members, giving a total

of 1,713,104 members and probationers; 12,262 local preachers; 53,937 baptisms of children, 50,972 of adults; 21,007 Sunday-schools, with 221,240 officers and teachers and 1,597,007 scholars; 17,896 churches, valued at \$66,212,701; 6,103 parsonages, valued at \$8,901,425. Amount of benevolent collections: for missions, \$565,725; for the Woman's Foreign Missionary Society, \$89,931; for church extension, \$91,825; for the Tract Society, \$13,832; for the Sunday-School Union, \$17,228; for the Freedmen's Aid Society, \$48,014; for education, \$34,692; for the American Bible Society, \$27,314; for "conference claimants" (disabled ministers, widows and orphans of ministers), \$153,555.

The receipts of the *Freedmen's Aid Society* for the year ending July 1, 1881, were \$96,141. The society maintained twenty-one schools and institutions in the Southern States, six of which were chartered colleges, three theological schools, and one a medical school; with all of these institutions 89 teachers were connected, and they were attended by 3,158 students. Of the students, 479 were in the primary, 275 in the intermediate, 1,292 in the normal, 412 in the academic, and 195 in the collegiate departments; while 57 were medical, 18 law, and 410 biblical students. The report mentioned additions and improvements that had been made to the buildings of several schools, and represented the financial condition of the schools as improving. A college of carpentry had been established in connection with Clark University, Atlanta, Georgia. Several thousand dollars had been spent in aid of schools for poor whites in the South; and colleges for white people were contemplated at Little Rock, Arkansas, and near Chattanooga, Tennessee.

The *Church Extension Society* received for the ten months ending October 31, 1881, \$200,001, and disbursed during the same period \$160,322. Three hundred and fifteen churches had been aided by gifts, or loans, or both, and grants to 161 churches, and applications from 50 churches, remained on file. In all, 51 churches (thirty during the year) had been built on the frontier, under a plan contemplating a special gift of \$250 to each church, to be supplemented by an appropriation from the society.

The receipts of the *Board of Education* for the year ending October 31, 1881, were \$9,286, or more than 300 per cent more than were received during the previous year. Eight thousand dollars were disbursed in aid of 100 students in 45 institutions.

The sales of the *Book Concern*, for the year 1880-'81, amounted to \$1,576,783. The whole number of books and tracts issued (books, 630,000 volumes; tracts, 1,444,250 copies) was 2,074,250. The catalogue of publications embraces: books of the general catalogue, 1,375; books of the Sunday-school libraries, 1,800; Sunday-school requisites, 291; tracts not in-

cluded under the previous headings, 1,019; total, 3,985.

The receipts of the *Missionary Society* of the Methodist Episcopal Church for the year ending October 31, 1881, were \$625,663, and its expenditures were \$643,084. The treasury was in debt on the 1st day of November, 1881, \$130,922. The General Missionary Committee met in the city of New York, November 2d, and made the following appropriations to maintain the operations in the various mission-fields during 1882:

I. FOREIGN MISSIONS:	
Africa (Liberia and the interior).....	\$6,000
Central America.....	200
South America (Northeast South America, Southeast and Western South America).....	13,050
China (Foochow, Kiukiang, Peking, and Western China missions).....	70,857
Germany and Switzerland.....	24,000
Scandinavia (Denmark, Norway, and Sweden).....	45,926
India (North India and South India).....	62,759
Bulgaria and Turkey.....	11,754
Italy.....	25,000
Mexico.....	80,000
Japan.....	88,281
Total for foreign missions.....	\$327,327
II. MISSIONS IN THE UNITED STATES NOT IN ANNUAL CONFERENCES TO BE ADMINISTERED AS FOREIGN MISSIONS (including missions in Arizona, the Black Hills, Dakota, the Indian Territory, Montana, New Mexico, Utah, and West Nebraska).....	
	44,565
III. DOMESTIC MISSIONS:	
1. Welsh (Northern New York Conference)....	200
2. Scandinavian.....	17,600
3. German missions.....	40,000
4. French missions (in New England).....	200
5. Chinese missions (in California, New York, and Oregon).....	18,470
6. American Indian missions.....	3,550
7. English-speaking missions.....	167,550
IV. MISCELLANEOUS APPROPRIATIONS.....	75,000
V. FOR THE LIQUIDATION OF THE DEBT.....	60,000
Total of appropriations.....	\$752,262

The foreign missions included 99 missionaries; 70 assistant missionaries (or wives of missionaries); 39 missionaries of the Women's Foreign Missionary Society; 199 native workers of the Women's Foreign Missionary Society; 218 native ordained preachers; 1,152 native unordained and local preachers and teachers and other helpers; 28,127 members; 8,782 probationers; an average attendance on worship of 55,931; 331 day-schools, with 11,161 scholars; 1,002 Sunday-schools, with 48,516 scholars; 12 high-schools and colleges, with 39 teachers and 653 students; 8 theological schools, with 18 teachers and 79 students; 632 orphans under care; 271 churches, and 852 other places of worship. Of the members, 2,044 were in Liberia, 224 in South America (the Argentine Republic and Uruguay), 1,724 in China, 9,697 in Germany and Switzerland, 2,782 in Norway, 6,300 in Sweden, 607 in Denmark, 3,169 in India, 27 in Bulgaria, 708 in Italy, 507 in Japan, and 338 in Mexico.

In the *Domestic Missions*, 21 missionaries, 33 local preachers, 1,731 members and 421 probationers, with 21 Sunday-schools having 1,120 scholars, are registered as among the American Indians; and 5 missionaries, 26 teachers and 5 other helpers, 114 members and 46 pro-

bationers, with 8 day-schools having 619 scholars, and 6 Sunday-schools having 189 scholars, among the Chinese.

The reports of the *Woman's Foreign Missionary Society*, made at its annual meeting, May 12th, showed that its receipts for the year had been \$107,932, or \$31,656 more than the receipts for the previous year. It had 2,578 auxiliary societies, 65,662 annual members, and 3,623 life members. It had sent eight new missionaries to foreign fields, and now sustained 38 American missionaries in China, India, South America, Japan, Mexico, and Africa, and supported more than 200 Bible women and teachers, 6 hospitals and dispensaries, 15 boarding-schools, with more than 700 pupils, 125 day-schools, with nearly 3,000 pupils, three orphanages, with about 400 orphans, and two homes for friendless women, and had secured the systematic visitation of more than 1,000 zenanas. Five medical graduates were in the field.

The first session of a *Delegated Conference in India* was held at Allahabad, July 14th to 18th. Thirteen delegates were in attendance from the North India and South India Conferences. The Rev. J. M. Thoburn, D. D., was elected chairman. A constitution was adopted which declares that the delegated conference "shall have the management and control of such interests as are common to the Methodist Episcopal Church in the Indian Empire, and do not legitimately belong to a single annual conference, and may authorize such measures as are needful for promoting or conserving such interests, provided no action be taken contravening the organic law of the Methodist Episcopal Church."

Provision was made for holding sessions every three years—the next being appointed for January, 1884—to which delegates are to be chosen in the proportion of one to every five members of each annual conference, and one lay delegate to each presiding elder's district; and an executive committee of three was appointed to act during the interim between the sessions. A Board of Publication was created, and authorized to establish at Allahabad a Methodist publishing house for India, with an endowment fund of \$100,000. A Board of Education was appointed, whose office should be to promote harmony in the distribution and management of the schools of the Church. A resolution was adopted defining the relations of agents—such as the missionaries of the *Woman's Foreign Missionary Society*, missionary teachers who do not preach, and others, who are not members of the Annual Conference. A paper on the marriage and divorce laws of India was adopted to be sent up to the Government as the expression of the Church. A memorial was adopted for presentation to the Board of Bishops, asking that bishops who may visit the Indian churches in the future "may arrange to remain two years, or at least through two cold seasons in India during every four years, until such time

as they may deem it best to advise the residence of one of their number in this empire." Statistical reports were presented of which the following is a summary: Members of annual conferences (European and native), eighty; local preachers (European and native), 124; church-members (European and native), 4,668; native Christians, 6,500; secular schools (fifteen for Europeans), 355; scholars, 9,103; Sunday-schools (219 vernacular), 266; scholars (more than three fourths native), 11,386; church-buildings, forty-eight; probable value, \$175,452; parsonages, seventy-three; probable value, \$86,240.

II. METHODIST EPISCOPAL CHURCH, SOUTH.—The receipts of the *Board of Missions* of the Methodist Episcopal Church, South, for the year ending March 31, 1881, were \$108,344. The appropriations made by the board, in May, 1881, for the ensuing year amounted to \$182,750. Besides the home missions within the annual conferences, the board sustained a German mission conference, with which were connected sixteen local preachers and 1,189 members; an Indian mission conference, with 113 local preachers and 4,830 Indian members (besides white and colored members), and with a manual-labor school for boys in the Creek nation and a school for girls in the Choctaw nation; a mission to the French creoles in and around New Iberia, Louisiana, with one local preacher and seventy-two members; a mission in China (Shanghai, Nantziang, and Suchow), with seven foreign missionaries, two women-missionaries, eight native preachers, one local preacher, and 113 members; a mission in Central Mexico, with two foreign missionaries, thirty-four native preachers, twenty-three teachers, 710 members, and 600 day-scholars; the Mexican border mission, on the Rio Grande, with one superintendent, fourteen native preachers, and 699 members; and a mission in Brazil (Rio Janeiro and the province of São Paulo), to which five missionaries are attached.

III. METHODIST PROTESTANT CHURCH.—In the following table will be found a list of the Conferences, with the number of pastors, unstationed ministers, and members of this Church, as given in the "Methodist Protestant Year-Book" (Adrian, Michigan) for 1882. The statistics of the Alabama, Arkansas, Georgia, Georgia colored, Mississippi, North Arkansas, Oregon, South Illinois, and Texas conferences are for 1880; those of the other Conferences are for 1881. The tables give of additional items: number of probationers, 3,009; of Sunday-schools, 1,483, with 21,573 officers and teachers, and 76,409 scholars; number of churches, 1,599; of parsonages, 300. Contributions: for pastors' salaries, \$218,767; for home missions, \$4,210; for foreign missions, \$4,344; for ministerial education, \$1,814; for Sunday-schools, \$10,979; for general purposes, \$11,142. Total value of church property, \$3,062,975.

The General Conference of this Church meets every four years; the next meeting is appointed to be held in May, 1884. The general interests of the Church and its various enterprises between the sessions of the General Conference are placed in charge of the Annual Council, which consists of the Boards of Ministerial Education, Missions, and Publication, with their secretaries and agents, editors and publishers, and the presidents of the colleges, and meets in July of each year. The Board of Publication, which is elected by the General Conference, has two principal offices or directories—one at Baltimore, Maryland, the other at Pittsburg, Pennsylvania—at each of which a general weekly religious paper and a number of Sunday-school periodicals are published. Besides these, a general religious weekly paper is published at Greensboro, North Carolina, a semi-monthly paper at Magnolia, Arkansas, and a monthly missionary paper at Springfield, Ohio. The literary institutions of the Church include Adrian College, Adrian, Michigan; Western Maryland College, Westminster, Maryland; Yadkin College, Yadkin, North Carolina;

and Gittings Seminary, La Harpe, Illinois. The Board of Missions supports four "home missions," a mission in the Choctaw nation, Indian Territory, and a mission in Japan, where one woman missionary and an assistant are employed and a girls' school of twenty-eight pupils is taught. Its receipts for the year were \$4,761. A Woman's Foreign Missionary Society co-operates with this board. The Board of Ministerial Education received \$3,227, and gave assistance during the year to fourteen young men preparing for the ministry. The publication offices, colleges, boards, and benevolent societies have together property valued at \$402,550.

IV. WESLEYAN METHODIST CONNECTION.—The following is a summary of the statistics of the British and Affiliated Conferences of this Church:

CONFERENCES.	Local preachers.	Traveling preachers.	Members.
British Conference	24,400	2,571	501,800
Irish Conference	1,500	250	24,237
French Conference	29	1,544
Total	26,200	2,550	507,351

The statistics of the Sunday-schools are: in the British Conference, 6,426 schools, 121,493 teachers, 810,280 scholars; in the Irish Conference, 309 schools, 2,760 teachers, 24,500 scholars; in the French Conference, sixty schools, 340 teachers, 2,900 scholars; total, 6,795 schools, 124,593 teachers, 837,680 scholars.

The report of the *Chapel Committee* to the British Conference showed that 141 new chapels had been completed, at a cost of £299,912, which, with the enlargements that had been made to the other chapels, provided 27,669 additional sittings.

The committee of the *Metropolitan Chapel Building Fund* reported that thirty of the fifty churches contemplated by the plan of the fund had been constructed within the Metropolitan District, eleven others were in course of construction, and five more were contemplated.

The *Book-Room* had published forty-two distinct works and fifty-three new tracts, had sold 1,779,000 copies of periodicals and 4,976,572 tracts, besides hymn-books, catechisms, reward-books, etc., and returned £4,300 of funds for distribution to beneficiaries.

The annual meeting of the *Wesleyan Missionary Society* was held in London, May 2d. The Rt. Hon. William McArthur, M. P., Lord Mayor of London, presided. The total income of the society for the year had been £130,093, of which £10,162 had been received from the mission districts, and the expenditures had been £168,403, leaving a deficiency in the accounts of £38,310. The Ladies' General Committee for Education in Foreign Countries had also expended £3,166, besides furnishing school materials, clothing, etc., for the missions. The following is a general sum-

mary of the missions under the immediate direction of the committee of the society, and of the British Conference in India, China, South and West Africa, and the West Indies :

Central or principal stations, called circuits.....	411
Chapels and preaching-places.....	2,493
Missionaries and assistant missionaries, including supernumeraries.....	460
Other paid agents, as catechists, interpreters, day-school teachers, etc.....	2,011
Unpaid agents, as Sunday-school teachers, etc.....	7,906
Full and accredited church-members.....	83,132
On trial for church-membership.....	11,990
Scholars, deducting those who attend both the day and Sunday schools.....	88,867
Printing establishments.....	3

The *Wesleyan Conference* of Great Britain met in its one hundred and thirty-eighth session at Liverpool, July 19th. The Rev. George M. Osborn, D. D., was chosen president. More than one hundred candidates for the ministry who had completed their studies, thirty-six of whom were destined to the missionary stations, were ordained. Sixty candidates were proposed to be received on trial, in addition to a number who had been received in previous years and were waiting on the reserve list, while the number of applications for new ministers was very small. The Conference decided that it could not receive any of the new candidates except those from Wales (where new pastors were needed), and those who had offered themselves for foreign mission-work. The Conference resolved that no candidate who had failed to obtain the minimum number of marks in the preliminary examination of candidates should undergo the usual examination of the district committee, unless in the judgment of that committee he should possess such special gifts as would justify an exceptional procedure. A committee which had been engaged for seven years upon a revision of the liturgy of the "Book of Offices," presented a report recommending certain changes in the services, the operation of which would be to remove or modify passages susceptible of a construction in the direction of sacerdotalism. The recommendations of the committee in regard to the forms for the administration of the Lord's Supper, the solemnization of matrimony, and the burial of the dead, were adopted, and those in respect to the form for the administration of baptism were recommitted. The committee charged with the revision of the catechism was authorized to adopt at its discretion the renderings of the revised version of the New Testament in the proof-texts subjoining to the answers. The General Committee of the Missionary Society was authorized to prepare a plan of organization for the churches in South Africa, for the purpose of constituting them into a distinct, self-supporting church and an affiliated conference. A proposition was made to give a similar organization to the West Indian churches, but was deferred on the ground that those churches were not yet ready for autonomy. The schools for sons of ministers at New Kingswood and Woodhouse Grove were reported embarrassed in finances; and

the Conference decided, as the most effective measure of relief, to suspend the school at Woodhouse Grove and concentrate its support on the one at New Kingswood. The subject of the theatre was brought up by the publication of a pamphlet by a young minister, maintaining that theatres might be made moral and useful. The opinion of the Conference, as expressed by the president, being to the effect that such a transformation of the theatre could not be hoped for in England, the author of the pamphlet expressed regret for having published such views. The Home Mission Committee, having asked the Government to grant an allowance for the seat-rents of soldiers worshipping regularly in Methodist churches, the Government had replied that it never gave money in that form, but offered to provide the allowance under the form of head-money. After some debate as to whether acceptance would not commit it to the appearance of receiving a subsidy from the state, the Conference decided to accept the offer of the Government, and to instruct the committee to take such steps in relation to the money that might be received, as would secure a fair remuneration for provision for Wesleyan soldiers in the chapels, and the utmost efficiency for the religious work in the army.

The *French Conference* met in Paris, June 10th. The Rev. M. Cornforth presided. The statistical reports showed that the Conference had 166 chapels and other preaching-places, 29 ministers, 95 local preachers, 109 class-leaders, 1,775 members, with 104 on trial, 53 Sunday-schools, with 301 teachers and 2,655 scholars.

V. PRIMITIVE METHODIST CONNECTION.—The following is a summary of the statistics of this connection as they were reported to the Conference in June, 1881: Number of ministers, 1,149; of local preachers, 15,597; of class-leaders, 10,709; of members, 185,316; of chapels, 4,360; of other preaching-places, 1,863; of Sunday-schools, 4,097, with 69,279 teachers and 383,202 scholars. The increase in the number of members from the previous year was 2,625. The sum of £4,463 had been paid from the profits of the *Book-Room* to benevolent funds. The year's collections for the *Superannuated Preachers' and Widows' and Orphans' funds* amounted to £7,184, with which two hundred and sixty beneficiaries had been cared for.

The total receipts of the *Primitive Methodist Missionary Society* for missionary and other purposes were reported at its anniversary, May 7th, to have been £35,010. The whole number of home, colonial, and foreign stations was returned as 235, with which were connected 1,237 preaching-places and 309 ministers. Of these, 96 stations, having 8,056 members, were in the Australian colonies and New Zealand, and 92 stations, with 8,222 members, in Canada. The foreign mission at North Aliwal, South Africa, had been contin-

ued with some success, notwithstanding the disturbed condition of the country. The mission at Santa Isabel, West Africa, had suffered from the death of members.

The sixty-second annual *Primitive Methodist Conference* met at Hull, June 5th. The Rev. Charles Kendall was chosen president. New legislation was discouraged. A letter of sympathy with Mr. Gladstone in his parliamentary work and his efforts to remove the difficulties he had to encounter was agreed upon, and a petition was ordered prepared in the name of the Conference in favor of the "local-option" measure which Sir Wilfrid Lawson was urging in the House of Commons.

VI. METHODIST NEW CONNECTION.—The following is a summary of the statistics of this body as presented to the Conference of 1881: Number of chapels, 506; of churches, 465; of ministers, 183; of lay preachers, 1,245; of church-members, 27,770; of members on trial, 3,878; of schools, 452, with 11,093 teachers and 79,954 scholars. The increase of church-members during the year was 797.

The *Book-Room Committee* reported that the receipts of the publication office had been £2,939, and that it had £1,860 of stock on hand. The *Chapel Fund Committee* reported that eleven new chapels and two schools had been built during the year, at a cost of £9,500; that forty-one chapels had had their debts reduced or extinguished to the amount of £6,750; and that a total sum of £13,728 had been raised in connection with the fund. The *Connectional Aid and Extension Fund*, which had been established a year before to raise £12,000 in aid of the mission, chapel, loan, college, and paternal funds, had received subscriptions of £8,740, of which £3,550 had been paid. The receipts of the fund for *Home and Foreign Missions* had been £7,177, but those funds were in debt to the amount of £2,203; the expenditures for missions had been £7,461. The mission in China returned fifty-eight chapels, fifty-five churches, five missionaries, a large staff of native catechists and teachers, 1,091 members, 228 on trial, eleven schools, 140 students, and 19 baptized children. The increase of members during the year was 189.

The *Conference of the Methodist New Connection* met at Halifax, June 12th. The Rev. W. Stacey, D. D., was chosen president, and in his inaugural address called attention to the constitution of the coming Methodist Ecumenical Congress as a triumphant acknowledgment of the principle of equal lay representation, on which the government of the New Connection was based. A resolution was passed approving the reform and equalization of the marriage laws, and ordered to be sent to the Conference on that subject which had been called to meet in London. A resolution was passed approving the motives of the Irish Land Bill, uttering the hope that it might result in good, and expressing sympathy with Mr. Gladstone in his efforts to remove discontent in Ireland.

Especial attention was given to the consideration of the means of extending the influence of the Connection in London; and a deputation, in which the president of the Conference was included, was appointed to visit the metropolis and confer with the superintendents of circuits and with laymen on that subject. A question having arisen respecting the use of the revised New Testament in the chapels, the president suggested that it would be well to wait for a considerable time.

VII. UNITED METHODIST FREE CHURCHES.—The district returns of these churches for 1881 give the number of members as 65,064, and of persons on trial for membership as 6,817, and show a net increase in the home stations of 355. The foreign stations return an increase of 440, making the whole increase for the denomination, 795.

The chapel secretary reported to the Conference in July, as the result of special efforts made in view of the year being the year of the census to obtain returns on all questions relating to connectional property, that the number of chapels was 1,145, of which 662 had been built since 1860, that they cost £1,266,073, and were in debt £405,288; that the school-houses cost £139,000, and were in debt £26,097; that sixty ministers' houses, settled on trust, cost an average sum of £402 each; that the chapels afforded an accommodation of 359,961 sittings, of which 106,412 were let, at an average rent of £3 14s. each. The capital of the Chapel Loan Fund exceeded £10,000.

The *Book-Room* returned a profit of £1,200, available for distribution among the benevolent funds of the Connection.

The annual meeting in behalf of the *Home and Foreign Missions* was held in London, April 25th. The general income of the society for the year had been £17,325, and the expenditure had been £17,047. The Home Mission Chapel Extension Fund was in its fifth year; only a relatively small amount of the promised subscriptions remained unpaid, and the sum of £8,834 had been voted for the purchase of land and the erection of chapels and school-houses. Reports were made of the condition of the missions in East Africa; Sierra Leone, where the churches, in the absence of a European missionary, had been under the care of two colored ministers, and whence liberal contributions had been received to the General Mission Fund; and Jamaica, where the mission had been severely afflicted by the hurricane of August, 1880. The society has also a mission at Ningpo, China.

The *Annual Assembly of the United Methodist Free Churches* met in London, July 27th. The Rev. Richard Chew was chosen president. A resolution of thanks to the revisers of the New Testament was passed, and the work was commended to the study of ministers and people. A question was brought up on the application of a minister formerly of this connec-

tion, who had joined the Congregationalists, to be re-admitted to the Conference, as to whether it was expedient to re-admit ministers who had left the body, and then, presumably because they had not succeeded elsewhere, offered to return. With this was involved the question whether it was right and just to take the applicant when stations could hardly be found for ministers already recognized, and when candidates were obliged to stand over. The applicant was not admitted. A Sunday-school secretary was appointed, an annual day of prayer for Sunday-schools was set apart, and provision was made for the insertion of a column in the numerical schedule showing what scholars had joined the church during the year.

VIII. AUSTRALASIAN WESLEYAN METHODIST CHURCH.—This church includes the several annual conferences in Australia, Tasmania, and New Zealand, the Wesleyan South Sea missions, and local missions to the Chinese in Victoria, the Maories in New Zealand, and Scandinavian settlers. It embraces, according to the statistical reports presented to the General Conference in May, 303 ministers, with 42 supernumeraries, and 104 preachers on trial, 61,045 members, and 8,172 persons on trial for membership.

The receipts of the *Australasian Wesleyan Missionary Society* were reported at the annual meeting in Sydney, January 27th, to have been £14,677. This society has charge of the South Sea missions, including the missions in the Feejee and Friendly Islands, Samoa, and Rotumah, which were formerly under the direct control of the British Wesleyan Missionary Society, and also the newly established mission in New Britain, New Ireland, and the Duke of York Islands, and returned for them 18 English and 55 native ministers, with 33,033 native members and 5,641 persons on trial for membership.

The *General Conference of the Australasian Wesleyan Methodist Church* met at Adelaide, May 11th. The Rev. J. S. Waugh, D. D., was chosen president. An application was received from the New Zealand Conference, asking, on account of its remoteness from the other conferences of the connection, to be set off as a self-governing and independent body. The Conference judged the proposal premature, and invited the New Zealand Conference to submit a plan or constitution for the proposed organization before the change should be definitely pronounced upon. The churches in Tonga, or the Friendly Islands, were erected into a separate district. The resolution of the previous General Conference with reference to class-meetings was re-affirmed. It insists upon attendance at class-meetings as a test for membership in the church, but authorizes the recognition of devout persons "who can not be persuaded to attend the class-meeting" as communicants, and the issuing of communicants' tickets to them. A committee was ap-

pointed to prepare counsels and suggestions for a more efficient conduct of the society classes. A form of service for the public recognition of members was prepared. The subject of the conduct of the Rev. George Brown, missionary in New Britain and New Ireland, who had in 1878 conducted a military or police expedition against cannibal chiefs who had killed and eaten some of the missionary teachers, was reviewed, and Mr. Brown was heard in his own defense. A resolution which had been passed by the New South Wales and Queensland Conference, recognizing the dangerous position in which Mr. Brown had been placed, but regretting that no other course than the one he had taken was open to him which would insure the safety of those of whom he was regarded as the protector, was approved; and a resolution was afterward adopted, expressing sympathy with Mr. Brown, and intimating that he had not violated the regulations which governed the missionary work of the Church. A proposition from the English Wesleyan Missionary Society asking to be relieved from its engagement to assist the Australasian missions with funds, on paying £1,500 for the current year and £750 for the next year, was accepted, with the reservation of the right to review the subject in the next General Conference.

MEXICO (ESTADOS UNIDOS DE MÉXICO, or REPÚBLICA MEXICANA). The following table, reproduced from the "Anales," published by the Ministry of Public Works in 1881, exhibits the population of the different States, etc., of the republic, with their capitals, and the number (for the most part estimated) of inhabitants contained in these last:

STATES, ETC.	Popula- tion.	Capitals.	Popula- tion.
Sonora.....	115,424	Tures.....	8,000
Chihuahua.....	225,541	Chihuahua.....	12,000
Coahuila.....	130,026	Saltillo.....	26,000
Nuevo Leon.....	203,254	Monterrey.....	14,000
Tamaulipas.....	140,137	Ciudad Victoria..	6,000
Vera Cruz.....	542,913	Vera Cruz*.....	10,000
Tabasco.....	104,747	San Juan Bautista	6,000
Campeachy.....	90,413	Campeachy.....	14,000
Yucatan.....	302,315	Mérida.....	30,000
Sinaloa.....	186,491	Culiacan.....	8,000
Jalisco.....	983,454	Guadalajara.....	80,000

Lower California (Ter.)	80,203	La Paz.....	3,500
Total.....	9,908,011

* Until recently Jalapa was the capital of the State of Vera Cruz.

In the official report above referred to the area of the republic is set down at 1,921,240 square kilometres (741,791 square miles), while in statistical returns of an official character, published in 1869 and 1873, it stood at 761,640* square miles. Of the total population shown in the foregoing table, it is calculated that 52 per cent, or 5,130,597, are females. The classification by races appears as follows in the "Anales": Europeans and Spanish-Americans, 1,882,522; pure-blooded Indians, 3,765,044 (the Mexicanos and Cuiclatecos numbering together 1,626,511); and mixed races, 4,260,445. According to Humboldt, the population of New Spain in 1804 was 5,764,731; and Don Fernando Navarro y Noriega gave it (for 1810) at 6,122,354, distributed as follows:

Europeans and Spanish-Americans.....	1,097,928
Indians.....	8,676,281
Mixed races.....	1,833,706
Secular clergy.....	4,229
Regular clergy.....	8,112
Nuns.....	2,098
Total.....	6,122,354

Then the absolute increase of the Mexican population in seventy-two years has been a little over 50 per cent; but in order to determine the precise rate of increase, allowance should be made for the population of the former provinces of the republic—New Mexico, Texas, and (Upper) California. The numerical superiority of females over males among the native inhabitants of the hot lands (*tierras calientes*) of the intertropical regions is a curious fact observed in Mexico as, in general, elsewhere in tropical countries.

The President of the Republic is General Manuel Gonzalez, inaugurated December 9, 1881. The Cabinet was composed of the following ministers: Foreign Affairs, Señor Ignacio Mariscal; Interior, Señor Carlos Díez Gutiérrez; Finance, Señor F. Landero y Cos; War, General H. Treviño; Justice and Public Instruction, Señor E. Montes; Public Works, General C. Pacheco.

The President of the Supreme Court (and consequently, by the terms of the Constitution, Vice-President of the Republic) is Licentiate Ignacio L. Vallarta; and the magistrates are: Licentiates Pedro Ogazon, Manuel Alas, Miguel Blanco, José Maria Bautista, Juan de Mata Vazquez, Eleuterio Avila, Jesus M. Vazquez Palacios, Manuel Contreras, Juan Manuel Saldaña, Pascual Ortiz, and José Fernando Corona; with Señor José Eligio Muñoz, Attorney-General, and the Procurator-General.

The Governor of the Federal District (appointed by the President of the Republic for an unlimited term) is Señor R. Fernandez. The other Governors were as follows:

Aguas Calientes.....	Señor R. Avellanos.
Campechy.....	" Arturo Shielz.
Chiapas.....	" Miguel Utrilla.
Chihuahua.....	" Luis Terrazas.
Coahuila.....	" Evaristo Madero
Colima.....	" Francisco Santa Cruz.

* See "Annual Cyclopædia" for 1874, in which and in the volumes for 1875 and 1879 are interesting statistics concerning population.

Durango.....	Licentiate Francisco Gomez del Palacio.
Guanajuato.....	" Manuel Muñoz Ledo.
Guerrero.....	General D. Alvarez.
Hidalgo.....	" Rafael Cravioto.
Jalisco.....	Señor Fermín G. Kiestra.
México.....	" J. Zubietta.
Michoacán.....	" P. Dorantes.
Morelos.....	" Carlos Quaglia.
Nuevo León.....	" G. Garza Garcia.
Oaxaca.....	General Porfirio Diaz.
Puebla.....	" Juan N. Mendez.
Querétaro.....	Señor Francisco G. de Cosío.
San Luis Potosí.....	" Francisco Bustamante.
Sinaloa.....	" Mariano Martinez de Castro.
Sonora.....	" C. Ortiz.
Tabasco.....	" M. Foucher.
Tamaulipas.....	" Antonio Canales.
Tlaxcala.....	" Grajales.
Vera Cruz.....	" Apolinar Castillo.
Yucatan.....	" Aneona.
Zacatecas.....	" Jesus Aréchiga.
Lower Califor's (Ter.)	" Tibureio Montiel.

The State Governors are elected for a term of four years. The Governor of the Territory of Lower California is appointed by the Federal Government.

The Mexican Minister to the United States is Señor Don Matias Romero, accredited in April, 1882, and successor to Señor M. de Zamacona; and the Mexican Consul-General in New York is Dr. Juan N. Navarro. The United States Minister to Mexico is Hon. P. H. Morgan; and the United States Consul-General at the capital is Mr. David H. Strother. The Archbishop of Mexico is the Rt. Rev. P. A. de Labastida (1863).

The army in 1881 was composed approximately as follows: 20 battalions of foot: 12,200 men and 740 officers; 14 regiments of horse: 4,850 men and 518 officers; 6 brigades (of 5 batteries each) of artillery: 1,645 men and 180 officers; coast-guards: 71 men and 22 officers; 9 corps of rural guards (*guardias rurales*): 1,692 men and 192 officers; and Invalids: 280 men and 19 officers—total, 22,367 rank and file. The navy consists of five gunboats.

The national revenue for the fiscal year 1879-'80 was set down at \$21,936,165.39 in the returns of the *Tesorería General de la Federación*. In the budget for that year the revenue was estimated at \$16,303,455.

The amount and branches of the expenditure for the same year appeared as follows, in the same official returns:

EXPENDITURE.	
Legislative Power.....	\$901,897 69
Executive Power.....	42,170 48
Judiciary.....	319,915 91
Ministry of Foreign Affairs.....	235,290 88
" of the Interior.....	2,482,168 14
" of Justice and Public Instruction.....	1,057,153 00
" of Public Works, etc.....	2,179,088 57
" of Finance.....	4,565,519 87
" of War and Marine.....	8,678,562 66
Total.....	\$20,431,797 20

On comparing the total *actual* expenditure (as shown in the foregoing table) with the revenue, it will be seen that the year 1879-'80 was marked by a deficit of \$4,128,342, which, however, is below the usual standard of annual deficits* in Mexico.

* See "Annual Cyclopædia" for 1880, p. 511.

Of the \$1,057,183 expended by the Ministry of Justice and Public Instruction, \$636,811 was for the latter branch. It should be remarked, that the expenses of primary instruction, like those of the benevolent institutions, are defrayed out of the funds of the various municipalities. By far the heaviest drain on the Mexican Treasury is the War Department, the outlay for account of which in 1879-'80 amounted to \$3,678,562, or rather more than two fifths of the entire revenue. The Department of Public Works, etc. (*Fomento*), disbursed \$1,219,063 for railways (subsidies, etc.).

The following schedule presents the budget estimates for each of the four years commencing 1878-'79:

YEARS.	Revenue.	Expenditure.
1878-'79.....	\$16,123,507	\$22,108,046*
1879-'80.....	16,303,455*	23,334,636*
1880-'81.....	17,811,125*	23,128,213*
1881-'82.....	25,725,000*	25,221,696*

In the estimated revenue for 1881-'82 figures an item of \$4,000,000, the presumed yield of a "new impost on tobacco and a new stamp-tax"; and the lottery-tax (consisting of an impost of 10 per cent on the prizes drawn in the State lotteries) stands at \$60,000, against \$32,856 for the year immediately preceding.

To the statements given in the "Annual Cyclopædia" for 1880 (page 511), in relation to the national debt of the Mexican Republic, there is nothing of importance to add here, save the following declaration published by the Mexican Minister in Paris:

LEGATION OF THE UNITED STATES OF MEXICO IN PARIS, {
PARIS, January 17, 1881.

It has come to my knowledge that the name of the Mexican Government has been mixed up in a very recent speculation in Mexican bonds, under the impression that persons of American nationality were purchasing for its account. This report lacks all foundation. The Mexican Government has nothing whatever to do with them.

The name of the Government of Mexico is frequently being used with reference to the Mexican debt, with the evident object of bringing about rises and falls in the bonds. I am bound to declare that no person whatever has been or is authorized to use the name of the Mexican Government; and whatever telegrams may be supposed to come or may come from Mexico in reference to the debt should be received with the greatest mistrust from whatever sources they may proceed or by whomsoever they may be received. I do not know the intentions of my Government, but I can assert that, when the moment for the settlement of the Mexican credit shall be thought to have arrived, steps will be taken to give due publicity to all interested as to the intention of the Mexican Government; and that, therefore, all letters or telegrams (so frequently received from Mexico from persons in confidential communication with some member of the Government) on questions connected with our credit may be treated as wholly untrustworthy.

E. VELASCO.

The fifth annual installment (\$300,000) of the Mexican indemnity to the United States was paid in 1881 with equal punctuality as in the preceding years.

* From official publications.

The supineness of the Government in regard to the publication of commercial statistics renders it impossible to obtain any other information than that (very meager indeed, owing to the same difficulty) included in the consular reports to the Department of State. In an octavo volume of nearly 700 pages, issued from the *Ministerio de Fomento*, no allusion to the foreign trade of the republic is anywhere met with, notwithstanding some forty pages are taken up with Federal and State finance reports! Reference may be made to the "Annual Cyclopædia" for 1880 (page 512) for details concerning trade and industries. With greater facilities for the transportation of her varied products to the coasts and frontiers, Mexico finds her commerce with Europe and the United States already considerably extended; but the increase will be still more apparent when some of the new railways now in process of construction shall have been completed. Sincere well-wishers of Mexico have for some time past been urging upon the attention of both governments the necessity of a commercial treaty between that country and the United States. Such a measure could not fail to turn the tide of Mexican commerce from European shores to our own, with incalculable benefit to the countries on either side of the Rio Grande.

The great problem of the hour for Mexico is the execution of her numerous railway projects, due for the most part to American enterprise, but eagerly accepted and encouraged by the Mexican Government as the means of developing her unbounded natural resources, and elevating her to the place which Nature designed her to occupy among Western nations. The following extract from a circular issued by the Board of Directors of the Mexican Central Railway Company, and the remarks on railway concerns contained in President Gonzalez's message, of which a few paragraphs are also here transcribed, will throw some light on the progress already achieved in this direction:

MEXICAN CENTRAL RAILWAY COMPANY, LIMITED, {
BOSTON, April 12, 1882. }

Circular No. 3.

This company has constructed 218 miles of its main line from the city of Mexico north, and 136 miles from Paso del Norte south, and twenty miles on the Tampico line. Total amount of road constructed to date, 374 miles. The total interest on bonds issued and to be issued this year, including coupons due January 1, 1883, will amount to \$991,935. After a careful examination of the earnings of the road, as far as reported, and the estimates of General Manager Fink and General Superintendent Anthony, together with the information obtained from all other sources, I estimate the gross earnings of the road for the year 1882, exclusive of earnings on company's materials, at \$1,793,584; deducting 60 per cent for operating expenses (the company paying no taxes), the net earnings applicable to interest will be \$719,434. The company has reserved in the treasury \$2,000 of the first-mortgage bonds and \$2,000 of the stock per mile, which may be applied to the payment of interest during construction if required. When the main line is constructed, this reserve will amount to \$5,800,000 of bonds and \$2,500,000 of stock. The gross earnings

on the division of the road from the city of Mexico north have been up to date \$200,000, exclusive of company material. The amount of subsidy due the company on the line already constructed is about \$5,500,000, and certificates are now being delivered as fast as they can be executed. The cash collected on subsidy to date is \$97,500. This collection was principally made at Vera Cruz, no reports having been received from more distant custom-houses. Basing our estimate upon the amount of duties paid into the several custom-houses of the republic in the year 1881, the company expects to collect in cash the sum of \$800,000 during the present year. The board have resolved to construct the main line as fast as possible, and hope to complete the same during the year 1883; and, to justify them in making contracts for materials in season, so that the work shall not be interrupted, they have decided to raise the sum of \$6,032,500, and they now offer to subscribers, under circular No. 1, or their assigns, the first right to subscribe for that amount, each subscriber under said circular being entitled to subscribe for the same number of blocks which he now holds under circular No. 1. After payment of the first ten per cent no further calls will be made until the subscription under circular No. 2 is exhausted, which will probably be about September 1, 1882.

The total length of railway lines in operation throughout the country in 1881 has been given at 1,865 kilometres (1,166 miles), including 166 kilometres of tramways or horse-car lines. The aggregate passenger traffic for 1880 has been reported at \$8,196,161; the aggregate tonnage of freight at 272,809,729; and the excess of receipts over expenditures at \$4,670,208.

Among other important subjects referred to by President Gonzalez in his message on the occasion of the opening of Congress, April 1, 1881, were the following:

GENTLEMEN DEPUTIES AND SENATORS: To-day we inaugurate the second term of your sessions, which I am happy to say commences under the most favorable circumstances and amid the most flattering prospects. There is no portion of our national domain whose inhabitants are not at this time in the enjoyment of peace; and if, as there seems to be every reason to hope, the good sense of the Mexican people shall continue to develop and strengthen in this direction, at no distant day perhaps we, the people of the New World, changing characters and ceasing to be actors, may become the tranquil spectators of the social and political convulsions of Europe.

The Minister of the Interior, with the view of enlarging and regulating our facilities of intercourse, both external and internal, holds under advisement various proposals of contracts with steamship companies, having already concluded a contract with parties in Tabasco for regular lines of communication between the gulf ports and in the interest of the coasting-trade.

I do not doubt that you will hear with especial interest the report of the Department of Public Works, as the subject of internal improvements and their decisive influence on the future prosperity of the country is now the absorbing idea of the Mexican people as well as of its rulers. On the 10th of March last the submarine cable was completed connecting the ports of Vera Cruz and Tampico with Brownsville, Texas, thus putting our republic in direct telegraphic communication with the rest of the civilized world. Within the present month a telegraphic line between Sinavia and Guadalupe de los Reyes will be finished, and that uniting Culiacan with Alamos commenced. A branch line from Cuencamie to Villa Lerdo in Durango is finished, and the line from Caxaca to Tehuantepec prolonged to Iuchatan to unite with that

from the State of Chiapas, which has already reached Truxila Gutierrez. Contracts have been made for the construction of a line from Tacotalpa to San Christobal, which will unite Tabasco and Chiapas; and the necessary materials have already been ordered from abroad to construct a line which is to unite Yucatan and Campeachy with Tabasco, and, eventually, with Vera Cruz. Several important lines will also be commenced very shortly in the frontier States of the north. The Morelos Railroad Company has now constructed about sixty-three miles of track, which will be extended to Cuantla in a short time. The Government has accepted two and a half miles of the branch which is to unite this road with that from Mexico city to Vera Cruz. The State government of Guerrero has transferred to a company the concession of a railroad from Acapulco to this capital, and in the month of May next the work will be commenced in Acapulco. The different lines which are to unite Vera Cruz and Jalapa, Jalapa and San Andrés, Puebla and San Marcos, are also in course of construction. The Vera Cruz and Alvarado Company have also completed seven and a half miles of track. The line from Mérida to Progreso in Yucatan is about being finished; of the line from Mérida to Peto, the Government has accepted about nine miles; and work has been begun on the other line which is to connect that capital with Kalkin. The railroad of Hidalgo has in operation about seventeen miles, and that leading from Puebla to Izcirar has a branch extending to Cholula. Work is actively progressing on the line from Puebla to San Martín Texmelucan, as well as on the projected line from Matamoros to Monterey. The Central Railroad Company has laid its track nearly to Tula, widened the track from Celaya to Irapuato, and is pushing the work of reconnoitring and surveying on the lines from San Luis Potosí to Tampico, and from Chilmalma to Paso del Norte. The Mexican Construction Company is making its embankments from this city to Toluca, and has commenced the construction of the line of Pátzcuaro, Morelia, and Salamanca, as likewise that from Zacatecas to San Luis Potosí—all of which privileges it has obtained by transfer. The same company has exhibited its plans for over thirty miles of the route from Manzanillo to the interior, and has actually commenced reconnoitring the route from Nuevo Laredo to Monterey. Twelve and a half miles of completed track, constructed by the Sonora Company, and beginning at Guaymas, have been accepted; and, according to official information now in possession of the Executive, the road will have reached Hermosillo before the rainy season commences. The Tehuantepec Company, taking advantage of the dry season, has pushed its work with energy, drawing their laborers from the "Tierra Templada," and pushing their reconnoitring parties southward across the isthmus for the purpose of ascertaining the most convenient terminus on the Pacific. The Executive submits to the enlightened consideration of Congress the contract which he has entered into with Mr. James B. Eads for the construction of a ship-railway across the Isthmus of Tehuantepec. It is with peculiar satisfaction that I feel justified in announcing to Congress the favorable condition of the public Treasury, and the fact that it is evidently and progressively improving. From official data we are assured that during the first six months of the present fiscal year the Federal income, when compared with six months of the preceding year, exhibits an increase of more than \$400,000. It may be safely presumed that the second half year will show a proportionate increase, and in this case the total public income will reach \$21,000,000* per annum, while in former years, with the exception of the last, it fluctuated between \$17,000,000 and \$19,000,000. The state of the Treasury, it is to be hoped, may be still further improved by the labors of the various commissions which have been appointed for the purpose of suggesting a plan of assessment in

* Compare statement on page 561.

the Federal District—of amending as far as possible the tariff now in force, and consulting generally as to the easiest method of augmenting the public revenues and regulating the collection of the Federal taxes. The estimates of receipts and expenditures of the Treasury for the incoming fiscal year were laid before Congress on the day designated by the Constitution; and I can assure you that not only the Executive but the whole country will view with approbation the prompt and zealous action of both Chambers in giving this budget that timely attention which our fundamental law requires for it, without proposing to interfere with other important business.

Our infant navy has been increased by the addition of one vessel, bearing the honored name of Benito Juarez, and attached to the Pacific service.

Since the signing of the convention referred to in the article "Guatemala" in our volume for 1879, events have transpired of a nature to interrupt the cordial relations hitherto existing between Mexico and Guatemala. The estrangement, at first the outgrowth of misunderstandings concerning the question of boundaries long pending between the two republics, has been confirmed by the appeal on the part of Guatemala for the friendly intervention of the United States, which latter step provoked the publication by the Mexican Minister of Foreign Relations, Señor Don Ignacio Mariscal, of a pamphlet entitled "Difficulties between Mexico and Guatemala; Proposed Intervention of the United States; some Official Documents," and containing, besides, ex-Secretary Blaine's correspondence on the subject to Mr. Morgan, United States Minister to Mexico, a recapitulation of the more important phases of the question from colonial times to the present day. Here follow a transcript of Mr. Blaine's letter, and an extract of Señor Mariscal's exposition of facts:

MR. BLAINE TO MR. MORGAN.

DEPARTMENT OF STATE, WASHINGTON, }
June 18, 1881.

PHILIP H. MORGAN, Esq., etc., etc.

SIR: In my instructions of the 1st instant and today, I have so clearly amplified the spirit of goodwill which animates this Government toward that of Mexico, that I am sure no room for doubt can remain as to the sincerity of our friendship. Believing that this friendship and the frankness which has always distinguished the policy of this country toward its neighbors warrant the tender of amicable counsel when occasion therefor shall appear, and deeming such counsel due to our recognized impartiality, and to the position of the United States as the founder and, in some sense, the guarantor and guardian of republican principles on the American Continent, it seems proper now to instruct you touching a point upon which we feel some natural concern. I refer to the question of boundaries and territorial jurisdiction pending between Mexico and Guatemala. In the time of the empire the forces of Iturbide overran a large part of the territory of what now constitutes Central America, which had then recently thrown off the Spanish domination. The changing fortunes of war resulted in the withdrawal of Mexican forces from most of that region, except the important provinces of Soconusco and Chiapas, which remained under their control. Since that time the boundaries between the two countries have never been adjusted upon a satisfactory basis. Mexico, become a republic, did not forego claims based on the imperial policy of conquest and absorption; while Guatemala, resisting further progress of Mexican arms, and disputing

step by step the conquest already made, has never been able to come to a decision with her more powerful neighbor concerning the relative extension of their jurisdiction in the disputed strip of territory lying between the Gulf of Tehuantepec and the peninsula of Yucatan. Under these circumstances the Government of Guatemala has made a formal application to the President of the United States to lend his good offices toward the restoration of a better state of feeling between the two republics. This application is made in frank and conciliatory terms, as to the natural protector of the rights and national integrity of the republican forms of government existing so near our shores, and to which we are bound by so many ties of history and of material interest. This Government can do no less than give friendly and considerate heed to the representations of Guatemala, even as it would be glad to do were the appeal made by Mexico in the interest of justice and a better understanding. The events, fresh in the memory of the living generation of Mexicans, when the moral and material support of the United States, although then engaged in a desperate domestic struggle, was freely lent to avert the danger with which a foreign empire threatened the national life of the Mexican Republic, afford a gratifying proof of the purity of motives and benevolence of disposition with which the United States regard all that concerns the welfare and existence of its sister republics of the continent. It is alleged, on behalf of Guatemala, that diplomatic efforts to come to a better understanding with Mexico have proved unavailing; that under a partial and preliminary accord, looking to the ascertainment of the limits in dispute, the Guatemalan surveying parties sent out to study the land, with a view to proposing a basis of definitive settlement, have been imprisoned by the Mexican authorities; that Guatemalan agents for the taking of a census of the inhabitants of the territory in question have been dealt with in like summary manner; and, in fine, that the Government of Mexico has slowly but steadily encroached upon the bordering country heretofore held by Guatemala, substituting the local authorities of Mexico for those already in possession, and so widening the area in contention. It is not the present province of the Government of the United States to express an opinion as to the extent of either the Guatemalan or the Mexican claim to this region. It is not a self-constituted arbitrator of the destinies of either country, or of both, in this matter. It is simply the impartial friend of both, ready to tender frank and earnest counsel touching anything which may menace the peace and prosperity of its neighbors. It is, above all, anxious to do any and every thing which will tend to make stronger the natural union of the republics of the continent in the face of the tendencies of other and distant forms of government to influence the internal affairs of Spanish America. It is especially anxious, in the pursuance of this great policy, to see the Central American republics more securely united than they have been in the past, in protection of their common interests, which interests are, in the onward relations, identical in principle with those of Mexico and of the United States. It feels that everything which may lessen the goodwill and harmony so much to be desired between the Spanish republics of the Isthmus must in the end disastrously affect their mutual well-being. The responsibility for the maintenance of this common attitude of united strength is, in the President's conception, shared by all, and rests no less upon the strong states than upon the weak. Without, therefore, in any way prejudging the contention between Mexico and Guatemala, but acting as the unbiased counselor of both, the President deems it his duty to set before the Government of Mexico his conviction of the danger which would ensue to the principles which Mexico has so signally and successfully defended in the past should disrespect be shown to the boundaries which separate her from her weaker neighbors, or should the authority of force be resorted to in the establishment of

rights over territory which they claim, without the conceded justification of her just title thereto. And especially would the President regard as an unfriendly act toward the cherished plan of upbuilding strong republican governments in Spanish America, if Mexico, whose power and generosity should be alike signal in such a case, shall seek or permit any misunderstanding with Guatemala when the path toward a pacific avoidance of trouble is at once so easy and so imperative an international duty. You are directed to seek an interview with Señor Mariscal, in which to possess him with the purport of this instruction. In doing so, your judgment and discretion may have full scope to avoid any misunderstanding on his part of the spirit of friendly counsel which prompts the President's course. Should Señor Mariscal evince a disposition to become more intimately acquainted with the President's views after your verbal exposition thereof, you are at liberty to read this dispatch to him, and should he so desire, to give him a copy.

I am, sir, your obedient servant,

(Signed) JAMES G. BLAINE.

EXTRACT OF SEÑOR MARISCAL'S EXPOSITION.

... The complaints of the Guatemalans are not sincere, and the government of General Barrios knew very well how different are the facts of the case from the statements made to the Government at Washington. Even before consulting the President, he could assure Mr. Morgan that the good offices of his government were received with high esteem by the Government of Mexico. There is as yet, he added, no motive whatever for the fear that the latter will appeal to force to resolve the boundary question with Guatemala, which for many years has been under pacific and patient discussion, the Mexican Government having always been the promoter of the discussion, and of its solution by friendly measures. The recent events of which the Guatemalan Government complained had been the subject of discussions in which the arguments of Mexico had not been answered, the last notes of the Mexican Government having usually been left without reply. The tactics of the Government of Guatemala had consisted in appealing, for lack of reasons, to delays and evasions. The present state of the question is, that the survey of the frontier by commissions of engineers appointed by the two governments is still pending. The appointment of these commissions was made by virtue of a convention promoted by Mexico, in which was stipulated the suspension of negotiations upon boundaries until the said frontier could be surveyed, and certain points which formed the basis of discussion could be astronomically determined.

The Mexican Government positively desires to bring the question of boundary to a just and pacific conclusion, and it is not possible at present even to say whether this question, at least in part, may become a proper one for an arbitration. As to the perfect title of Mexico to the State of Chiapas, including the department or district of Soconusco, of which it has been in possession for so many years, the Mexican Government has several times declared that it does not and can not decorously admit any question. What it has consented to discuss among the claims of Guatemala, and for which it has been surveying and mapping out the frontier, is the matter of the boundaries of Chiapas and Soconusco, on the Guatemala side. But it may readily be seen that this can not yet give occasion to an arbitration, since the data have not yet been obtained which have been thought indispensable for the decision of the points at issue. Mexico is very far from absolutely refusing arbitration, but does not think it possible at present, for the reasons just mentioned, and reserves her decision as to accepting it in the future, concerning certain points on which it might be useful.

Mexico can never forget what was witnessed by the present generation of Mexicans as referred to by the Hon. Mr. Blaine—i. e., that the United States lent

their generous moral support, when, being invaded by a foreign army, her people struggled alone and without resources from abroad against a European monarch and his instrument in this country, who was supported by certain misguided elements at home. Nor will she forget that the sentiment of the American people during that crisis clearly showed that, if the United States had not been engaged in a civil war of vast proportions, the support given to Mexico would have been more than moral, and would have sufficed to terminate the struggle some years earlier.

In the same note (Secretary Blaine's) it is stated that the forces of the Emperor Iturbide having occupied a large portion of the territory of Central America, the fortune of war forced them to abandon all that territory except Soconusco and Chiapas, and that Mexico, after becoming a republic, did not desist from reclamations founded upon the imperial policy of absorption and conquest. In this there are some historical errors, and especially one which is due, as already stated, to one-sided allegations or to the fact that, unfortunately, the history of Mexico is not well known. Even during the empire of Iturbide it was not conquest but the free-will of the inhabitants of Chiapas and Soconusco which determined their annexation to Mexico, as well as that of all the provinces of Central America except Salvador. In the use of the same liberty, they afterward separated from this country and formed with Guatemala a republic; always excepting Chiapas and Soconusco, which, after Mexico became a republic, renewed their determination to remain incorporated therewith. As it is not possible here to recount the history of what occurred, it will suffice to mention that, on account of the ever-renewed claims of Guatemala, there have been published very sincere and carefully studied treatises with the object of proving the right which Mexico originally acquired to this portion of her present territory, basing it, not upon conquest, but upon the will of the inhabitants, the proofs of which may be found in unquestionable documents which have been published. Among these publications are those respectively made by Don Manuel Larrainzar and Don Matias Romero, persons well acquainted with the facts concerning Chiapas and Soconusco, since the former is a native of that State and the latter has resided in Soconusco, where he had to abandon his property, which was devastated by Guatemalan invaders. But, without alluding to the contents of the said publications, it will be understood how inaccurate are the attacks made upon the right of Mexico to these regions which form a State of the Union, by simply examining the long and weighty note which Señor Lafragua, as Minister of Foreign Affairs, addressed to the Minister of Guatemala in this capital, under date of October 9, 1876, adjoining to it several documents of a conclusive tenor. This note, which has been circulated in a printed form, and in which the original rights of Mexico to Soconusco and Chiapas, now placed beyond doubt by a possession of more than thirty and fifty years respectively, are victoriously illustrated and proved; this note, which should have given rise to a serious discussion, has remained up to the present time unanswered, as the Government of Guatemala habitually leaves those which it can not answer. The brief summary of that extended note will show by itself that the titles of Mexico have not consisted of absorption and conquest, as the Hon. Mr. Blaine has been led to believe by means of calumnies against this republic. The closing words of that document are as follows: "Summing up the argument of the present note, the following points have been demonstrated: 1. Chiapas was a province similar to the others which formed the captaincy-general of Guatemala. 2. Chiapas, on the 3d day of September, 1821, freely separated from Guatemala and united with Mexico. 3. Chiapas, on the 12th day of September, 1824, again joined the United States of Mexico by the free choice of a majority of her inhabitants (it having been previously

shown that the voting took place without the presence of Mexican forces in any part of the State, and that there was a large majority in favor of Mexico). 4. Soconusco, in 1821, was a *partido* of the Intendency of Chiapas, and as such united with the Mexican Empire. 5. Soconusco, in 1821, voted freely in favor of union with Mexico on the 3d day of May. 6. The act drawn up at Tapachula on the 24th day of July, 1824, was a revolutionary and illegal procedure. 7. Central America recognized the Supreme Junta of Chiapas, and agreed to respect its decision," etc. Without copying the entire summary, the preceding will convince the reader that the Mexican Government has never based its original rights to Chiapas and Soconusco upon conquest. As to recent events, the points of complaint against Mexico presented by the Government of Guatemala to the Government of the United States are four in number:

1. That the diplomatic efforts made to reach a settlement with Mexico have been fruitless.

2. That there exists a preliminary and partial agreement for the purpose of ascertaining what are the true limits; and that the Guatemalan commissions of exploration sent to survey the region in order to prepare the basis for a definitive settlement were imprisoned by the Mexican authorities.

3. That the agents of Guatemala charged to take a census of the territory in question were treated in the same manner.

4. That the Mexican Government has cautiously but constantly invaded the frontier district which had heretofore been in the possession of Guatemala, replacing the local authorities which were there existing by those of Mexico, thus augmenting the area of the disputed territory.

It will be convenient to reply to these points in the same order:

1. Diplomatic efforts for the settlement of limits with Guatemala have always and exclusively been initiated by Mexico. In 1832 the Mexican Government sent Don Manuel Díez de Bonilla as Envoy and Minister Plenipotentiary, and in 1853 Don Juan N. de Pereda with the same character, without obtaining any result. Señor Pereda remained in Guatemala until the year 1853. In the various interviews which he had with Don Manuel Pavón, Minister of Foreign Affairs of that republic, that gentleman constantly refused to celebrate a treaty of limits, and said that Guatemala proposed, in the pending negotiations with Mexico, to simply recognize the *status quo* of the frontier between the two countries without any alteration. Señor Pereda had to suspend his official relations with the Government of Guatemala on account of the refusal of the latter to treat concerning limits, and because the said Government, in a discourteous and offensive manner, refused to grant the internment of several *emigrados* from Mexico, who were conspiring against the peace of this republic. The question of limits was not again discussed until October, 1873, when Señor Lafragua, Minister of Foreign Affairs, addressed a note to Señor García Granados, *chargé d'affaires* of Guatemala, indicating the necessity that the question should be concluded. For that purpose he invited the Government of Guatemala to appoint a plenipotentiary to open the negotiations in this capital. Señor Uriarte, the new Minister of Guatemala, replied after some months, in July, 1874, after Señor Lafragua had asked him by note whether the said invitation was accepted, that he was provided with full power to enter upon negotiations. On the 21st of August Señor Uriarte presented a memorandum to serve as a basis for discussion. After various conferences, Señor Lafragua replied to the memorandum, by a note dated October 9, 1875, with which he inclosed a draft of a treaty of limits between the two republics. This important note, already alluded to, has remained without reply, as has also been previously remarked. In July, 1877, negotiations were resumed between Señor Vallarta, as Plenipotentiary of Mexico, and Señor Uriarte, Minis-

ter of Guatemala. The result was the convention of December 7th of that year.

2. The note of Mr. Blaine alludes to this convention. By it, as already indicated, there was created a mixed commission of Mexican and Guatemalan engineers, charged with making a survey, forming plans, and fixing astronomically certain points in order to advance the knowledge of the question at issue, and afterward continue the discussion upon the limits of the two republics. In Article X it was stipulated that, during the suspension of negotiations upon limits, the high contracting powers would religiously respect and cause to be respected the actual possession, not raising or allowing to be raised any question relative to boundary-marks, and preventing every act of hostility on the part either of the authorities or citizens of the two republics. The commissioners met at Tapachula, November 18, 1878, and began their operations. On the 26th of January, 1880, three engineers of the Guatemalan commission appeared in the vicinity of Cuicco Viejo, a village of Soconusco, accompanied by a number of Indians, and placed there a cross. The local authorities believed that this act was intended to advance the boundary-post of Pinabete, recognized as the limit between the two republics, and situated eight leagues farther north, as had been done years before by the inhabitants of Tacaná, a village belonging to Guatemala. Under this belief they questioned the said engineers, and not receiving satisfactory explanations of the act, nor being shown any document proving their character as commissioners, the said authorities arrested them and sent them to Tapachula. There they were immediately set at liberty by the political chief, who gave them the fullest reparations. This is the only case of imprisonment of engineers which Guatemala can cite, and as to this incident that Government appeared to be satisfied. The Mexican Government then believed that the local authorities had acted erroneously, but later acts of the Government of Guatemala show that it had really been intended to change the landmarks.

3. A motive similar to the foregoing occasioned the arrest of the agents of Guatemala, to which allusion has been made. In December, 1880, a commission, composed of the alcalde of Tacaná and four other persons, proceeded to register the inhabitants of some *rancherías*, which, although a league distant from the Mexican village of Cuicco Viejo, form an integral part thereof. They went—not, as alleged, to take a census in disputed territory, but—to exercise acts of jurisdiction in the place, in order afterward to adduce them as a proof of possession by Guatemala. It is to be noted that the inhabitants of Tacaná, whose alcalde is the present subject of discussion, were the same who at a former time advanced the boundary-post of Pinabete, and that the *rancherías* in question would have been on Guatemalan territory if the said landmark had remained where it was then placed, on which spot the cross was afterward raised by the Guatemalan engineers. The said commissioners, who thus violated the convention binding them to respect the actual possession, were therefore justly arrested, and turned over to the district judge, in order that he might act in accordance with the laws of Mexico. The Minister of Guatemala complained of this act, alleging that those *rancherías* belonged and had always belonged to his country. In the reply made to him, under date of the 27th of January last, the inaccuracy of his assertions was proved by showing that those *rancherías* were within the provisional limits of Mexico, and that they belong to this republic, even according to the official map of Guatemala. In refuting the charges made by Señor Herrera in his note, against the Mexican authorities, it was shown by recent facts that the abuses have been on the part of the Guatemalan authorities. As Señor Herrera based the title of his country to the said points on the fact that there were certain assistant alcaldes appointed by the authority at Sibinal, a village of Guatemala, the un-

dersigned showed that the appointment had been first made after the signature of the convention which bound the two countries to respect the *statu quo* in regard to limits, and that consequently it only proved that Guatemala had violated her engagement. Señor Herrera confined himself to stating that he would inform his government of this note, and it has thus far remained without reply.

4. The accusations against Mexico under this fourth heading—i. e., a general charge of continual Mexican invasions of Guatemalan territory—are not only entirely false, but inconceivably audacious. There exists a plan of Soconusco made by Don José E. Ibarra, carefully formed, as is shown by the geographical and statistical notices of that department given in the margin. On it are marked in red ink the ancient limits, and in green those which seem to be recognized in recent times. The space between the two lines marks the advances made by Guatemala, and at the end of the marginal notices the dates are specified when they were effected. These invasions have been continued recently; the archives of the Department of Foreign Affairs are full of data upon those which have occurred since 1870. Without being, perhaps, among the most notable, one of these invasions was for the purpose of destroying the property of Don Matías Romero, as already indicated. Señor Romero, who is well known in Washington, where he represented Mexico for several years, could not, with all his characteristic moderation and prudence, prevent Guatemalan Indians, by order of a prefect of that nation, from invading his lands within the Mexican territory, destroying his property, carrying away prisoner one of his employees, and maltreating others. In November, 1875, a complaint was presented to the Government of Guatemala for this act, but hitherto no reply has been made. On the other hand, that government has imputed to Señor Romero confagurations and other crimes within the territory of Guatemala—charges entirely improbable, and which that gentleman has, moreover, refuted at length. In the same month and year the engineer Don Alejandro Prieto, secretary of the Mexican legation in Guatemala, made a survey of the frontier by direction of Señor Garza, then Mexican Minister to that Government. He made the journey and the survey in company with General Barrios, President of Guatemala, as was stated by Señor Garza in a letter addressed to Señor Lafragua, and by the government of Chiapas in a dispatch dated November 26, 1875. From this visit originated the sketch-map drawn up by Prieto, which may be found in this ministry, and which, as well from having been prepared under the inspection of President Barrios as for other reasons, can not be an object of suspicion to Guatemala. Upon it is marked the line which is the boundary in fact, and on it are also marked the points in dispute. To this line, then, must be referred the *statu quo* stipulated in the Convention of 1877. Now, the very notes of the Minister of Guatemala prove that his government, far from having respected it, has violated it at Tonintaná, at Las Chicharras, Cuicelo Viejo, and other points. That Government has gone so far as to defend the misdeeds of the Alcalde Mecño, who attempted to assassinate a Mexican surveyor, and burned ranchos within the territory of Mexico. It has done more. In December of last year it sent, or permitted to be sent, a force under the orders of the Prefect of San Marcos (a department of Guatemala), which invaded our territory and destroyed the landmark of Pinabete, the same which was demolished by the residents of Tacaná, and which was reconstructed shortly afterward. The said prefect then hoisted the flag of Guatemala precisely upon the cross so mysteriously erected by the Guatemalan engineers near Cuicelo Viejo. Complaint being made at Guatemala of these acts, that Government refused to give explanations to our minister, under the pretext that the subject had to be treated in Mexico, because Señor Loacza had no instructions to receive them. The Minister of Foreign

Affairs, Señor Montúfar, being pressed by our representative, who sent him a copy of a note from the undersigned manifesting surprise at such conduct, replied that the ground where these events took place belonged to Guatemala, without giving any reasons for such allegation, and overlooking the fact that the undersigned, in his note of the 27th of January last, to which no reply has been given, had demonstrated the contrary. Meanwhile the term of the Convention of December 7, 1877, had expired on December 31, 1879, without the scientific commissions having concluded their labors. The Mexican Government proposed to that of Guatemala that the said convention should be renewed for a term long enough to attain the object desired, and ordered its engineers to remain on the frontier, as in fact they have remained, notwithstanding that the Guatemalan engineers were withdrawn by their government without the formality of advising that of Mexico. The President of Guatemala personally informed our minister that he was willing to renew the convention, and that instructions to that end had been sent to Señor Herrera, Minister of Guatemala in Mexico. Señor Herrera, however, considered himself for several months without sufficient instructions to negotiate, alleging that those received were not sufficiently explicit. It was only recently (July 11th) that Señor Herrera, having come to speak with the undersigned about the friendly step taken by the Government of the United States, and the observation having been made to him that the Government of Guatemala had not yet sent him the instructions offered, made known that he had received them in the desired form. This conduct of his government, not at all sincere, and seemingly incomprehensible, is now explained by the step which the President of Guatemala, through his representative, has taken toward the Government of the United States. President Barrios wished, as may be inferred from the facts, to gain time while he applied to a friendly government complaining of injuries supposed to have been committed by the Government of Mexico, whose conduct he depicted with false colors while soliciting the interposition of good offices. In this application, he apparently omitted, however, to state that, at the request of Mexico, the renewal of the convention for the survey of the frontier was under advisement, a survey absolutely necessary, as declared by both governments, in order to fix the international limits, whether by diplomatic negotiations or other pacific means. The omissions and inexactitudes of the government of General Barrios, in its statements to the President of the United States, as well as its other acts concerning the question of limits with Mexico, show its policy upon this subject to be entirely lacking in sincerity and frankness. The facts briefly noted in this memorandum, and others which can not here be mentioned, authorize the suspicion that the said government, in addressing the President of the United States, has not really desired, as was pretended, to obtain the decision of an arbitrator upon the question of limits. It is very certain that it can not be ignorant of the impossibility for Mexico to admit any discussion of the rights she has to Chiapas and Soconusco, forming as they have done for many years a State of the Union, an integral part of the republic, and that it also understands how impossible it is to fix the limits between this State and Guatemala, before surveying the region in dispute, whoever may be the arbitrator charged to render such decision. The object, then, in pretending to promote an arbitration, can not be other than to gain time, as on former occasions, to continue the partial invasions and enervate the action of the Mexican Government in the simple defense of the national territory. The undersigned, in order to place upon record the facts of the interview with the Hon. Mr. Morgan, and the observations to which the note of the Hon. Mr. Blaine gave occasion, has drawn up the present memorandum.

(Signed) IGNACIO MARISCAL.

MEXICO, July 25, 1881.

MICHIGAN. The Legislature convened in regular triennial session on January 5th, and adjourned, *sine die*, June 11th, the session being the longest ever held in the State. Number of general acts passed, 290; local acts, 432; joint resolutions, 34; concurrent resolutions, 9. The joint resolutions included one submitting the question of a general revision of the Constitution of the State to the electors, to be voted upon at the general election to be held November 7, 1882, pursuant to section 2 of Article XX of the Constitution; also four amendments of the Constitution, as follows:

1. Amending section 12, Article VI, so as to empower the Supreme Court to appoint its own clerk.

2. Amending section 6, Article VI, to authorize the Legislature to provide for the election of additional circuit judges in the judicial circuit in which the city of Detroit may be situated, and authorizing the board of supervisors of the county of Wayne to vote an increase of salaries to the judges of such circuit, to be paid from the Treasury of Wayne County.

3. Amending section 1, Article IX, so as to increase the salaries of circuit judges from \$1,500 a year to \$2,500.

4. Amending section 10, Article X, to authorize the Legislature to provide, by general law, for a board of county auditors in each county, with "exclusive power to prescribe and fix the compensation for all services rendered for, and to adjust all claims against, their respective counties," subject to the restriction "that no such board shall be established in any county, unless the board of supervisors of such county shall so direct by a majority vote of all the members-elect."

The first two amendments were voted upon and adopted at the election held April 4, 1881; the other two amendments will be voted upon November 7, 1882.

Liberal appropriations were made in aid of the several educational and other State institutions, including \$400,000 for an additional asylum for the insane (since located at Traverse City in Traverse County); \$100,000 for a new library-building at the university; \$33,775 for a laboratory, library, and other buildings, at the Agricultural College; \$25,000 for a new building, for a training and practice school, at the State Normal School; \$10,000 for a lecture hall at the Reform School for Boys; \$38,000 for new buildings at the State Prison; \$52,900 for new buildings, permanent improvements, land, etc., at the Michigan Asylum for the Insane, Kalamazoo; \$75,000 for two new wings at the Eastern Asylum for the Insane, Pontiac, and \$15,000 for working capital for the same asylum; \$87,500 for two cottages, chapel, and school-building, gas-house, furniture, and permanent improvements at the State Reform School for girls; and \$10,000 for the purchase of a building at Lansing for the use of the State School for the Blind.

The laws relating to public instruction and

primary schools were revised and consolidated, and numerous fragmentary, crude, and conflicting laws repealed. The principal change from prior statutes relates to the examination of teachers. In 1875 the Legislature abolished the office of county superintendent of schools (the incumbent of which office had a few years previous succeeded to a portion of the duties of the township school inspectors), and gave the examination and licensing of teachers to a township superintendent of schools, to be elected at the regular township election. This change having proved unsatisfactory, fruitful only of a large crop of incompetent (and even illiterate) school-examiners, the act under notice abolished that office, and created a county board of examiners, consisting of three members. The chairmen of the several township boards of school inspectors—officials having in charge the formation of school districts and some administrative duties—were to meet on the first Tuesday in August, 1881, at the office of the county clerk in each county, and elect three school-examiners, one each for one, two, and three years, and annually thereafter one for the term of three years. The board is to hold at least two public examinations in each year, is to examine all applicants, and grant certificates to teachers in such form as the Superintendent of Public Instruction shall provide, "but no certificate shall be granted to any person who shall not pass a satisfactory examination in orthography, reading, writing, grammar, geography, arithmetic, and the theory and art of teaching, and, after the year 1881, history of the United States and civil government." Three grades of certificates are to be issued: the first grade to those who have taught at least one year with ability and success, to be good for three years and valid throughout the county; the second grade to teachers who have taught six months, good in the county for two years; the third grade a one-year license, but covering the same territory. Certificates may be suspended or revoked for cause. The secretary of the board is the chief officer of the board. Other provisions of the law are designed to secure a better grade of schools, as well as teachers, with more systematic and uniform supervision.

The highway laws were revised and consolidated, also the drainage laws. A new provision in the highway act substitutes a money-tax, to be expended by the commissioner, in lieu of the old system of work done by the property-holder. The change is to be made by a vote by ballot, at an annual or special township meeting, on the written demand of twelve or more freeholders. The amount of money-tax is limited to one half of one per cent on the assessed valuation. Another provision permits twenty-five per cent of any person's highway tax to be paid by setting shade-trees along the highway, and the commissioner is required to see that a given number of shade-trees are planted in each year. Provision is also made

for erecting and maintaining at least one watering-trough in each road-district.

The liquor-tax law was so amended as to largely increase the taxes on the manufacture and sale of both distilled and malt liquors. The taxes prescribed are: Distilled liquors—manufacturing, \$500 a year; selling at wholesale or at wholesale and retail, \$500; selling at retail, \$300. Brewed or malt liquors—manufacturing, \$65 for 1,500 barrels, and \$25 for each additional 1,000 barrels; selling at wholesale, or at wholesale and retail, \$200. The stringency of the provisions of the tax law and of the police laws was also increased. In the same line of legislation is “an act for the protection of children,” which prohibits the employment of children under sixteen years old by showmen of various grades; their admission to bar-rooms, saloons, or other places where liquors of any kind are sold; the admission to or maintenance in any county poor-house of any child admissible to the State public schools; the giving of obscene books, pamphlets, prints, papers, police reports, etc., to any minor; employing minors to distribute such prohibited printed matter, or the exhibition on any public street or highway in view of passing children of obscene prints, pictures, or prohibited articles.

The game laws were amended and made more stringent. At least one section of Act No. 151 is of interest to non-residents of the State. Section 2 reads: “No person, corporation, or company, shall kill, or expose for sale, or have in possession, except alive, at any time, any deer, ruffed grouse, colin or quail, pinnated grouse, nor wild turkey, or any part of the carcass of the same, with the intention of sending or transporting, or having the same sent or transported, beyond the limits of this State.” The penalty for the violation of this provision is fifty dollars’ fine for each offense, or thirty days in jail if the fine is not paid.

Act No. 18 is in the interest of women the possessions of whose husbands consist largely in personal property, and is entitled “An act to restrict the disposition of personal property by last will and testament.” The first restrictive clause reads: “If the testator shall leave surviving him a wife, the testamentary disposition shall be subject to the election of such wife, to take any interest that may be given to her, by the testator in his last will and testament; or, in lieu thereof, to take the sum or share that would have passed to her, under the statute of distributions, had the testator died intestate, until the sum shall amount to \$5,000, and of the residue of the estate one half the sum or share that would have passed to her, under the statute of distributions, had the testator died intestate; and, in case no provision shall be made for her in said will, she shall be entitled to the election aforesaid.”

The statute under which persons on trial charged with crime have been permitted to make statements to the jury, not under oath,

was amended by Act No. 245, which provides that a defendant in a criminal case may be sworn as a witness at his own request. When sworn, he is to be subjected to cross-examination, the same as any other witness. His neglect to testify shall not create any presumption against him, nor be commented upon before the jury. Former conviction may be shown for the purpose of affecting his credibility.

By the provisions of Act No. 187, all that is necessary to constitute a written instrument a full warrantee deed of conveyance, is that it shall be worded in substance as follows: “A. B. conveys and warrants to C. D.” (here describe the premises) “for the sum of” (here insert the consideration), such conveyance to be dated and duly signed, sealed, and acknowledged. It shall not be necessary to use the words “heirs and assigns of the grantee” to create in the grantee an estate of inheritance. If any lesser estate is to be conveyed, it must be so expressed. A similar form is provided for a quit-claim deed, for a mortgage, and for the acknowledgment.

Provision was made for turning over the bodies of persons dying in the poor-houses and prisons of the State, not claimed by relatives, to the demonstrator of anatomy in the University of Michigan, for the use of the medical schools of the State in the advancement of anatomical science. Under the operations of this law, the provisions of which are well guarded, grave-robberies in the State have substantially ceased. Provision was also made “for the medical and surgical treatment of dependent children at the hospital of the Michigan University,” including board, lodging, nursing, and other proper care.

Several amendatory railroad laws were passed; also important amendments made to the insurance laws; a commission established to “provide for the adoption and use of a standard form of fire-insurance policy; an act passed for the incorporation of plate-glass insurance companies; one to prevent the soliciting or issuing of unauthorized fire or inland marine insurance policies in this State; and one for a millers’ insurance company. Acts were passed to prevent the adulteration of food, to prevent foul brood in bees, to prevent the spread of yellows in peaches, and to enlarge the powers of boards of health in villages and townships. A commission was provided to revise the tax laws of the State, and the Governor appointed as such commission Messrs. John Moore, E. O. Grosvenor, William Chamberlain, C. A. Kent, and H. H. Hatch. The commission has completed the labor assigned to it, and the several bills prepared will be submitted to the Legislature convened in special session on the 23d of February, 1882.

The three most hotly contested measures considered during the session, or for many sessions, were: 1. A bill providing for the purchase of a sufficient number of copies of a compilation of the general laws of the State, made

by Andrew Howell, to supply State and local officials. The bill was opposed as a violation of section 15 of Article XVIII of the Constitution, which prescribes the method to be pursued in compiling the laws; the appointment of a compiler by the two Houses, in joint convention; the approval of his work by two commissioners appointed by the Governor; and the printing "in such manner as shall be prescribed by law." The friends of the bill claimed that the State could purchase a compilation as it could any other book or books; that the compilation in question was a superior work, and that, therefore, no reprint of the general laws was necessary within the meaning of the cited section. The bill passed the Senate without discussion, and almost unanimously. The opposition in the House was severe and prolonged, but the bill was passed by a small majority. It was vetoed by the Governor as unconstitutional, though the Attorney-General of the State and many of the leading members of the bar had given written opinions holding it constitutional. The Senate promptly passed it over the veto; but the House laid the bill and veto-message on the table. Another bill was prepared, with a view to overcome the Governor's objections to some of the details, passed by both Houses, and again vetoed. So the vexed question will come up again at the next regular session.

2. A bill to confirm the action of the board of control of railroad lands, conferring certain lands, rights, franchises, powers, and privileges upon the Ontonagon and Brulé River Railroad Company. The lands in question were granted by Congress in 1856, to aid in the construction of a railroad from Ontonagon to the Wisconsin State line, and conferred by the State in 1857 upon the Ontonagon and State-Line Railroad Company. The time named in the original grant for the construction of the road expired many years ago, but Congress had taken no steps to declare the grant forfeited. The opponents of the bill held that the grant was forfeited years ago by non-compliance with its terms; that *bona fide* purchasers of large tracts of lands had acquired interests that could not be legislated away; and that homesteaders on the lands would be wronged if exception was not made in the bill in their favor. The Lake Superior Canal and Iron Company, which had located valuable lands within the territory covered by the railroad grant, under the canal grant to which it had succeeded, joined persistently in the fight against the bill. The friends of the bill contended that no forfeiture could be had without the action of Congress, and cited decisions of the United States and State courts in defense of that position; that the sales made and patents-issued were without warrant of law, the title having been all the time in the State; and that there were no *bona fide* homesteaders on the lands. The discussion before the committee and also in the sessions were prolonged and heated, and charges of bribery and corruption were exchanged be-

tween the contestants. The bill finally passed the House by a vote of 69 to 23—two more than the necessary two thirds; and the Senate by a vote of 23 to 8—a single spare vote.* The bill was approved by the Governor, and the company named has already constructed and put in operation twenty miles of road. Bills are now pending in Congress to declare the grant, with other old railroad grants, forfeited.

3. A bill to authorize the incorporation of companies for the construction of union depots. Though a general act, it had a special purpose—the erection of a union depot at Detroit. The bill, as at first presented, met decided opposition in certain railroad quarters, but a compromise was finally agreed upon, and an amended bill was passed into a law.

The election of United States Senator for the full term of six years, from the 4th day of March, 1881, took place on Tuesday, January 18th, and the vote in each House was as follows:

	Senate.	House.	Total.
For Omar D. Conger, Republican	23	84	112
For George O. N. Lothrop, Dem.	2	13	15
Majority for Conger.....	97

In the Republican caucus held the week preceding the election a spirited contest was had, the candidates being ex-Governor Henry P. Baldwin, successor to the deceased Senator Zachariah Chandler, by appointment by the Governor; ex-Governor John J. Bagley, and Hon. O. D. Conger, then just closing his sixth successive term as Representative in Congress, and who, at the preceding November election, had been the successful candidate for a seventh term. After several ballots the name of ex-Governor Baldwin was withdrawn, when Mr. Conger received the nomination by a majority of one vote. On the same day Senator Baldwin, by a vote of 29 in the Senate, and 84 in the House, was elected for the term ending March 4, 1881, his own successor. The vote of the Democratic Senators was equally divided, one of them voting for Hon. Orlando M. Barnes, and the other giving his vote to the Republican candidate. The 13 Democratic votes in the House were given to Hon. George P. Sanford.

An election was held on the first Monday of

* On the day of this vote the legislative correspondent of the Detroit "Post and Tribune" wrote: "Thus ended the severest and most prolonged contest of this or any recent session. Not a stone was left unturned by the friends or foes of the bill, and pressure was brought to bear from every direction upon Senators and Representatives—from members of Congress familiar with the legislation attempted last winter at Washington, and from constituents at home who can not be supposed to have better knowledge of the merits of the bill than the Senators or Representatives whom they attempted to instruct. Only to-day one Senator received about half a dozen telegrams from his constituents advising him of the views of his friends and political partisans. The passage of the bill certainly can not be styled hasty or ill-considered legislation. Your correspondent takes no stock in the charges that votes have been bought and sold. The defeated parties interested in the bill have the courts open to them if the bill interferes with their legal rights."

April for Justice of the Supreme Court and two Regents of the University, with four party tickets in the field. There was nothing noteworthy in the platform of either party, no animation in the campaign, and the total vote polled was 106,008 short of that given for presidential electors at the preceding November election. The result was as follows:

FOR JUSTICE OF THE SUPREME COURT.

For Isaac Marston, Republican.....	127,536
" Augustus C. Baldwin, Democrat.....	73,869
" John B. Shipman, National Greenbacker.....	38,259
" Charles B. Hyde, Prohibitionist.....	12,525
Scattering and defective.....	57

Total..... 247,076

Marston over Baldwin, 54,167; over all, 8,003.

FOR REGENTS OF THE UNIVERSITY.

For James F. Joy, Republican.....	127,532
" Austin Blair, Republican.....	126,617
" George O. N. Lothrop, Democrat.....	73,750
" Henry Fralick, Democrat.....	74,193
" Charles J. Willett, National Greenbacker.....	32,614
" David Parsons, National Greenbacker.....	32,480
" Isaac W. McKeever, Prohibitionist.....	13,266
" Edward C. Newell, Prohibitionist.....	12,850
Scattering and defective.....	552

At the same election judges were chosen for the full term of six years in twenty-six of the twenty-eight judicial circuits. Party lines were loosely drawn in the larger number of circuits, and in eight circuits only a single candidate was placed in nomination. The judges elected are, with their majorities: 1. Andrew Howell, no opposition; 2. Andrew J. Smith, no opposition; 3. F. H. Chambers, 816; 4. G. Thompson Gridley, 1,481 plurality, with 3,269 votes for a third candidate; 5. Frank A. Hooker, 2,036; 6. William W. Stickney, 988; 7. William Newton, 1,321; 8. Vernon H. Smith, 2,589; 9. Alfred J. Mills, 230 plurality, with 1,447 for a third candidate; 10. Chauncey H. Gage, 761; 11. Joseph H. Steere, 469; 12. William D. Williams, no opposition; 13. Reuben Hatch, 111; 14. Frederick J. Russell, no opposition; 15. Russell H. Pealer, 913; 16. Herman W. Stevens, 624 plurality, with 703 for a third candidate; 17. Robert M. Montgomery, 872 plurality, with 1,248 for a third candidate; 18. Sanford M. Green, no opposition; 19. J. Byron Judkins, 1,788; 20. Daniel J. Arnold, no opposition; 21. Henry Hart, 4,146; 22. Chauncey Joslin, 257; 23. Jonathan B. Tuttle, 543; 24. Levi L. Wixon, no opposition; 25. Claudius B. Grant, 492; 28. John M. Rice, no opposition.

Three constitutional amendments were also voted upon and adopted. The first, amendatory of section 12, Article XIII, so that penal fines, heretofore devoted to library purposes exclusively, may be in whole or in part applied to the support of schools, when so ordered by the township board of any township or the board of education of any city. Vote for, 51,471; against, 8,370. The other two amendments (see a preceding paragraph) were adopted—the first by a vote of 53,840 to 6,628, and the second by a vote of 62,593 to 6,640. Each of the

amendments became a part of the Constitution January 1, 1882.

The annual report of the State Treasurer for the fiscal year ending September 30th shows the financial condition of the State at that date as follows:

Cash balance, September 30, 1880.....	\$1,375,643 01
Receipts for fiscal year.....	2,607,288 07

Total.....	\$4,183,931 08
Payments during the year.....	2,392,569 01

Balance, September 30, 1881..... \$1,791,362 07

The demands against the Treasury then due or to mature before the 31st day of December, 1881, were \$581,208.68. To this amount add the indebtedness to the trust funds as follows:

To sinking fund.....	\$559,000 00
" canal fund.....	66,543 62
" primary-school interest fund.....	606,552 45

Total..... \$1,161,696 07

Combining this last amount with that stated due and to become due for current expenses, the demands upon the Treasury aggregate \$1,742,904.75, leaving a net surplus of \$50,457.32, or \$215,474.22 short of the net surplus of the preceding year.

Of the interest-bearing bonded debt but \$1,000 have been paid during the year, leaving due:

Two-million loan, 6s, due January 1, 1883.....	\$590,000 00
War-bounty loan, 7s, due May 1, 1890.....	299,000 00

Add non-interest-bearing bonds: \$889,000 00

Adjusted bonds due Jan. 1, 1883.....	\$3,000 00
Part-paid bonds, adjusted at 57s 57	
per \$1,000.....	12,149 97

Total bonded debt..... \$904,149 97

Sufficient funds are held in the Treasury, and applicable for that purpose, to extinguish this debt. During the year the State has received interest on surplus funds, specific taxes, United States bonds, and tax-sales, to the amount of \$63,475.78, and paid interest on bonded debt, \$55,920. Surplus of interest received, \$7,535.78.

The trust-fund indebtedness has increased during the year from \$3,564,556.02 to \$3,752,476.84, and the interest paid on the same from \$226,889 to \$247,946.86. This interest was paid as follows:

Primary-school interest fund.....	\$183,550 49
Primary-school five per cent fund.....	16,481 01
University interest fund.....	35,083 77
Agricultural College interest fund.....	11,426 93
Normal School interest fund.....	3,454 66

The primary-school fund was increased from the above amount in the sum of \$305,395.27, transferred from the sinking fund pursuant to the decision of the Supreme Court made in January, 1881, and the amount disbursed to the school districts of the State in May, 1881, was increased from 47 cents per capita allowance to each child of school age (the rate for 1880) to \$1.20 per capita. The transfer from the specific tax fund to the same fund made for distribution in May, 1882, aggregates \$406,675.06.

The specific taxes which form so large an item in the receipts into the Treasury from year to year, and all of which, except the mining taxes collected in the Upper Peninsula, are set apart by constitutional provision—first, to the payment of the interest on the State's indebtedness to the educational funds; second, to the payment of the interest on the State debt; and, third (the principal of the State debt being now provided for), to the primary-school interest fund, for annual distribution, amounting in 1881 to \$750,039.29—came from the following sources:

Railroad companies.....	\$618,984 89
Street railway companies.....	8,195 63
Freight, sleeping, and palace-car companies.....	1,169 27
Fire-insurance companies.....	59,774 41
Life-insurance companies.....	20,269 02
Plate-glass insurance companies.....	51 28
Mining companies.....	89,428 22
Telegraph companies.....	4,067 70
Express companies.....	1,628 94
Plank and gravel road companies.....	285 66
River improvement companies.....	1,276 77
Musical societies.....	4 50
Total.....	\$750,039 29

The receipts from the same sources last year amounted to \$619,542.58. Increase, \$140,546.71.

According to the late United States census the local indebtedness (county, city, town, and school district) was, September 30, 1880, as follows:

Bonded debt of counties.....	\$570,303
Floating debt of counties.....	26,393
Bonded debt of townships.....	849,843
Floating debt of townships.....	279,357
Bonded debt of cities and villages.....	6,338,401
Floating debt of cities and villages.....	52,599
Bonded debt of school districts.....	1,298,501
Floating debt of school districts.....	96,051
Total.....	\$9,351,577

On the 6th day of October the Auditor-General apportioned the State taxes for the year for the following purposes:

For University of Michigan.....	\$115,000 00
" State Normal School.....	44,500 00
" State Agricultural College.....	50,969 50
" State Public School.....	41,650 00
" Michigan School for the Blind.....	13,500 00
" Institution for the Deaf and Dumb.....	41,600 00
" State Reform School for Boys.....	51,250 00
" State Reform School for Girls.....	93,550 00
" State House of Correction.....	3,565 32
" Eastern Asylum for Insane.....	96,000 00
" Michigan Asylum for Insane.....	52,900 00
" New Asylum for Insane.....	50,000 00
" Repairing Capitol.....	5,000 00
" Fish Commission.....	8,000 00
" State Board of Health.....	2,000 00
" Military purposes.....	57,271 73
" General State purposes.....	404,675 00
Total State taxes.....	\$1,142,734 55
Add indebtedness of counties to State.....	243,303 00
Total apportionment.....	\$1,391,037 55

The apportionment was made on the basis of the new equalization established by the State Board in August, which increased the valuation of the real and personal estate assessable from \$630,000,000, as determined in 1876, to \$810,000,000. The tax is a fraction over \$1.41 on each \$1,000.

Accompanying the annual report of the

State Treasurer is found a statement of resources and liabilities of the fifteen State banks, as shown by their official reports made July 2, 1881. Resources: Loans and discounts, \$3,-414,221.49; bonds, \$105,498.02; cash and cash items, \$479,366.39; real estate and fixtures, \$83,597.97; due from banks and bankers, \$679,291.51; expenses, \$12,175.31; over-drafts, \$35,564.03. Total, \$4,809,714.72. Liabilities: Capital, \$1,014,285.40; surplus, \$218,545.99; due banks, \$8,414.75; due depositors, \$3,443,-106.29; profit and loss, \$75,365.69; rediscounts, \$49,996.60. Total, \$4,809,714.72. The increase of capital over that reported July 1, 1880, is \$140,535.40; also of amount due depositors, \$909,173.29. The total resources exceed those of the previous year, \$1,035,585.34, and the loans and discounts fall short, \$50,-426.96. Increase in number of banks, two.

Fourteen savings-banks reported under date of October 3d. Resources: Loans and discounts, \$7,653,973.76; bonds and mortgages, \$1,806,-403.38; cash and cash items, \$921,391.54; real estate and fixtures, \$360,479.71; due from banks and bankers, \$1,169,931.85; expenses, \$34,111; over-drafts, \$40,949.73. Total resources, \$11,987,240.97. Increase over resources reported October 4, 1880, \$2,214,299,-78. The increase in item of loans and discounts was \$3,148,257.86, while the bond and mortgage securities decreased \$926,085.17. The liabilities were: Capital, \$1,165,000; surplus, \$118,952.29; due banks, \$177,520.99; due depositors, \$10,295,025.36; profit and loss, \$97,510.89; interest and exchange, \$133,-231.34. Total, \$11,987,240.47. Increase of amount due depositors, \$2,058,931.36; and of combined capital and surplus, \$7,821.05. Decrease in number of banks, one.

The preliminary report of the Commissioner of Insurance is made for the year ending December 31, 1881, and sets forth the financial condition of each stock, fire, and fire-marine insurance doing business in the State, and making the annual statement required by law. The commissioner summarizes the reports and tables: "The entire capital stock represented amounts to \$51,019,280; the admitted assets to \$138,512,491; surplus as regards policy-holders, \$88,974,649; and the surplus over capital and all other liabilities amounts to \$38,108,728. In making up the exhibit of both home and foreign companies, all deposits of funds made in States for the exclusive benefit of policy-holders in such States have been deducted from the available assets. A deduction has also been made of the liabilities in such States. The companies of foreign governments are each rated as having a capital stock of \$200,000, and their financial condition given on the basis of their assets and liabilities in the United States in accordance with the provisions of Act No. 71, Laws of 1879. The fire and inland marine risks written in Michigan during the year 1881 amount to \$181,740,666.-30; premiums received, \$2,256,644.19; and

losses incurred, \$1,490,366.24, as shown by the companies that have reported."

Comparing the business of the year with that of 1880, the commissioner says: "The results of the Michigan business show about the same in amount of risks written. The premium receipts in 1881 exceed those of 1880 by about \$225,000, but the losses incurred during 1881 will exceed those of 1880 in the sum of \$500,000.

The statistics given cover the business of 2 Michigan companies, 86 companies incorporated under the laws of other States, 1 Canadian company, and 23 foreign companies. The details for the two Michigan companies are: capital, \$500,000; admitted assets, \$831,307.19; liabilities, including reinsurance fund and capital, and excluding liabilities on special deposits, \$613,945.80; surplus, as regards policyholders, \$717,361.39; surplus over capital and all liabilities, \$217,361.39; risks written on Michigan, \$12,420,945; premiums received, \$148,547.27; losses incurred, \$76,924.62; losses paid, \$66,622.03.

The estimated amount of merchantable timber standing May 31, 1880, was as follows in the Lower Peninsula:

WHITE PINE (<i>Pinus strobus</i>).	No. of feet (board-measure).
Basins of streams flowing into Saginaw Bay, including Saginaw River and tributaries....	7,000,000,000
Basins of streams flowing into Lake Huron....	8,000,000,000
Basins of streams flowing into Lake Michigan....	14,000,000,000
Total.....	29,000,000,000
Cut for the census year ending May 31, 1880 (including 2,938,600,000 shingles and 428,445,- 000 laths, but exclusive of 36,000,000 staves and 8,330,000 sets headings).....	4,068,773,000

The pine remaining on the Lower Peninsula is distributed over about 6,500,000 acres. Little remains in large bodies south of latitude 44° north, though south to latitude 43° north, pine is still to be found covering small areas.

An estimated amount of 575,500,000 cords of hard-wood is distributed over some 20,000,000 acres.

In the Upper Peninsula it was as follows:

WHITE PINE (<i>Pinus strobus</i>).	No. of feet (board-measure).
Basin of Menominee River and tributaries (Marquette and Menominee Counties).....	1,600,000,000
Ontonagon, Houghton, Keweenaw, Baraga, Marquette (west and north of Menominee basin), and Menominee (east of Menominee basin) Counties.....	2,400,000,000
Schoolcraft, Chippewa, Mackinac, and Delta Counties.....	2,000,000,000
Total.....	6,000,000,000

Cut for the census year ending May 31, 1880
(including 106,482,000 shingles, and 34,260,000
laths)..... 828,488,000

An estimated amount of 124,500,000 cords of hard-wood is distributed over some 10,000,000 acres.

From "Michigan and its Resources," a pamphlet issued by the Commissioner of Immigration, the following table is prepared, showing State and United States lands subject to entry October 1, 1881:

COUNTIES.	Swamp- lands.	Public- school lands.	Agricul. College lands.	United States lands.
Alcona.....	14,095	5,923	25,785	9,360
Allegan.....	840	2,760
Alpena.....	45,960	6,480	6,060
Antrim.....	1,055	5,161	6,148	571
Baraga.....	11,774	62,000
Barry.....	40	111
Bay.....	1,118	2,183
Benzie.....	8,928	2,720	8,750
Berrien.....	40
Branch.....	46
Calhoun.....	160	120
Charlevoix.....	1,612	2,475	8,405	154
Cheboygan.....	20,749	10,697	5,728	10,748
Chippewa.....	57	84,098	292,610
Clare.....	1,779	3,744	2,075
Clinton.....	125
Crawford.....	18,187	5,504	22,457
Delta.....	271	15,508	185,240
Eaton.....	219	40
Emmett.....	6,086	6,059	2,344
Genesee.....	40
Gladwin.....	4,517	1,652	1,588
Grand Traverse.....	2,973	2,125	720	1,588
Gratiot.....	400	1,120	120
Houghton.....	13,548	59,000
Huron.....	8,177
Ingham.....	500	40
Ionia.....	80
Iosco.....	17,209	6,291	27,115	28,000
Isabella.....	40	720	40
Isle Royal.....	3,787	3,876	14,640
Jackson.....	80	400
Kalamazoo.....	40
Kalkaska.....	4,583	5,006	1,718	4,100
Keweenaw.....	2,211	4,000
Lake.....	1,348	4,485	8,120
Lapeer.....	178	860
Leelanaw.....	1,638	1,855	2,985
Livingston.....	200	40
Mackinac.....	120	84,423	18,000
Manistee.....	2,726	3,283	8,050	14,883
Manitou.....	2,002	1,923	15,393
Marquette.....	200	42,405	228,000
Mason.....	1,052	1,828	4,766
Mecosta.....	80	1,088
Menominee.....	3,177	13,814	45,500
Midland.....	403	8,656
Missaukee.....	11,142	3,547	1,759	2,883
Monroe.....	140
Montcalm.....	40	200	40
Montmorency.....	26,796	6,600	9,118	45,907
Muskegon.....	4,128	1,166
Newaygo.....	148	4,474	888
Oakland.....	80	40
Oceana.....	40	1,200	1,111
Ogemaw.....	3,518	4,602	1,500
Ontonagon.....	9,658	85,230	368,000
Osceola.....	458	2,012	160
Oscoda.....	2,544	5,800	17,065	67,150
Otsego.....	9,686	5,121	4,050	4,074
Ottawa.....	1,218	80
Presque Isle.....	55,574	10,955	1,239	31,563
Roscommon.....	24,730	4,194	11,443
Saginaw.....	1,994	2,074
Sanilac.....	123	2,720
Schoolcraft.....	75	88,191	187,500
St. Clair.....	1,970	440
St. Joseph.....	80
Tuscola.....	565	2,855
Van Buren.....	40	320
Wexford.....	1,197	4,280	28,040	1,006

There are, besides those enumerated, 200 acres of "University land" in Kalamazoo, 30 in Berrien, and 67 in Ottawa; and 280 acres of "asset land" in Lapeer, and 40 in Genesee.

In addition to the above lands held by the State, the several land-grant, railroad, and canal companies held lands at the same date, as follows:

	Acres.
Flint and Pere Marquette Railroad Company.....	146,100
Grand Rapids and Indiana Railroad Company.....	537,037
Jackson, Lansing and Saginaw Railroad Company.....	884,403

	Acres.	ROADS AND THEIR BRANCHES.	Length (1881) miles.
Detroit, Mackinac and Marquette Railroad Company.....	1,326,963	Lake Shore and Michigan Southern.....	531
Chicago and Northwestern Railroad Company.....	657,220	Michigan Central.....	908
Lake Superior Ship Canal, Railway and Iron Company.....	210,000	Grand Trunk.....	320
St. Mary's Canal and Mineral Land Company.....	127,000	Chicago and Grand Trunk.....	80
Michigan Land and Iron Company, successor to Marquette, Houghton and Ontonagon Railroad Company.....	400,000	Wabash, St. Louis and Pacific.....	258
		Detroit, Lansing and Northern.....	88
		Chicago, Saginaw and Canada.....	159
		Detroit, Grand Haven and Milwaukee.....	315
		Flint and Pere Marquette.....	15
		Flint and Pere Marquette (Saginaw and Mount Pleasant Branch).....	313
		Grand Rapids and Indiana.....	854
		Chicago and West Michigan.....	65
		Canada Southern.....	46
		Fort Wayne and Jackson.....	57
		Toledo, Ann Arbor and Grand Trunk.....	10
		Lake George and Muskegon.....	20
		Pinconning.....	24
		Tawas and Bay County.....	10
		St. Joseph Valley.....	100
		Port Huron and Northwestern.....	18
		Paw Paw.....	8
		Toledo and South Haven.....	10
		Muskegon River and Rose Lake.....	
		Hobart and Manistee.....	

The lands held by the four corporations first named are in the Lower Peninsula, and may be classed as pine and farm lands. The lands of the five other corporations are all located in the Upper Peninsula, and include both mineral and pine lands.

The last published report of the Commissioner of Railroads covers the year ending December 31, 1880, and the business of fifty corporations, under the control of thirty-six managements. These corporations operate 6,427.54 miles of road, 3,824 being in Michigan, an increase over 1879 of 166 miles. The capital stock of the fifty corporations, paid in and invested in the roads, is \$160,580,320.06, or \$27,376.48 per mile. The debt is: funded, \$142,212,896.73; floating, \$11,159,412.17; total, \$153,372,308.90, or \$26,147.63 per mile. Total stock and debt, \$313,952,628.95, being \$53,524.11 per mile of road, while the commissioner puts the total cost of roads and equipments at \$297,388,917.13, or only \$51,149.95 per mile. The total investment in Michigan he puts at \$204,673,520.43, and the cost of the Michigan roads at \$195,594,851.30. The excess of stock and debt over cost of road-bed and equipment is \$9,078,665.13, arising largely from the fact that "the resources of the corporations have not been sufficient to meet interest on the bonded debt and expenses, thereby incurring a floating debt, which is included in the account of indebtedness." But seven corporations failed to earn enough to pay operating expenses—four of them being "log-roads"—the deficiency being \$64,418.64. In 1879 ten companies were deficient in the sum of \$246,926.82. The total earnings of the roads were \$56,650,054.10, against \$45,942,860.23 in 1879. The expenses, \$32,268,996.74, against \$26,906,685.44. Earnings above operating expenses, \$24,381,057.36, an increase over 1879 of \$5,345,882.57. But six companies paid any dividends—the aggregate being but \$8,300,952.57. The total number of passengers carried during the year, 13,507,200, an increase of 2,541,583 over 1879. The number carried one mile was 114,580,292, at a cost of \$0.269 per mile. The freight tonnage was 55,122,240, exceeding the freight carriage of 1879 by 30,873,350 tons. The number of tons carried one mile was 4,789,420,773, an increase over 1879 of 1,190,744,288. The average charge per mile for each ton of freight hauled was $\frac{1}{100}$ of a cent per mile, against $\frac{1}{100}$ in 1879.

The following table shows the number of miles of railroad in Michigan on the 31st day of December, 1881, a year later than the commissioner's report:

UPPER PENINSULA.	
Chicago and Northwestern.....	202
Detroit, Mackinac and Marquette.....	152
Marquette, Houghton and Ontonagon.....	90
Mineral Range.....	12
Ilecla and Torch Lake.....	4

* Total..... 4,144

From tables in the "Lumberman's Gazette," published at Bay City, giving the total production of white-pine lumber in the Northwest for two years past, the following figures are taken, giving the cut at principal Michigan points for 1881:

	Feet.
Saginaw district.....	1,294,000,000
Manistee.....	250,000,000
Muskegon.....	632,500,000
Ludington.....	120,000,000
Grand Haven and Spring Lake.....	191,000,000
Cheboygan.....	92,000,000
Detroit and Lansing Railroad and Lake Huron Shore.....	320,000,000
Grand Rapids and Indiana Railroad.....	196,000,000
Chicago and West Michigan Railroad.....	65,000,000
Northern Railroad.....	84,000,000
Flint and Pere Marquette Railroad.....	95,000,000
Michigan Central Railroad, Mackinaw and Detroit and Bay City divisions.....	85,000,000
Miscellaneous.....	92,000,000
Total.....	8,516,500,000

The products of Bay and Saginaw County mills are definitely given as follows:

Lumber manufactured, feet.....	972,320,317
On dock at close of season, feet.....	232,120,029
On dock, sold, feet.....	118,605,117
On dock, unsold, feet.....	163,515,812
Laths manufactured.....	65,983,750
Shingles manufactured.....	354,925,500
Staves manufactured.....	47,480,959
Headings manufactured.....	5,440,947
Logs in mill-boom.....	46,498,590

The journal quoted says: "During the last three years the annual increase of production (in the Northwest) over each preceding year has been about 1,000,000,000 feet, yet, notwithstanding this enormous increase, the amount in manufacturers' hands is probably less at the present time (January 1, 1882) than during either of the three previous years."

The annual report of the salt inspector shows

* Increase over 1880, 320 miles.

92 steam-blocks in operation, 29 pan-blocks, 2 kettle-blocks; total number of blocks 121, and 4,500 salt-covers. Estimated annual capacity, 3,400,000 barrels. The following is a comparison of the amount and kind of salt produced in 1880 and 1881:

SALT.	1880.	1881.
Fine.....	2,589,037	2,073,910
Packers'.....	16,091	18,885
Solar.....	22,237	9,983
Second quality.....	45,623	52,321
Total.....	2,676,588	2,750,299
Increase.....		73,711

The total amount inspected in each salt district is as follows:

	Barrels.
District No. 1, Saginaw County.....	1,037,050
" No. 2, Bay County.....	1,112,529
" No. 3, Huron County.....	326,952
" No. 4, Iosco County.....	147,579
" No. 5, Midland County.....	74,537
" No. 6, Manistee County.....	16,042
Total.....	2,750,299

While the average depth of the Saginaw wells is about 900 feet, the Manistee salt deposit was reached at a depth of 1,964 feet, when 32 feet of solid salt-rock was found. A single Saginaw well has yielded 26,000 barrels in a manufacturing season of eight months.

A "Lumberman's Gazette" writer says: "The salt interest of Michigan can be safely pronounced a permanent source of wealth. Subterranean explorations are being made in widely scattered parts of the Lower Peninsula—in Berrien, Gratiot, Muskegon, Alpena, Cheboygan, and other counties—with promising prospects. Under a general enabling act passed by the last Legislature, an underground pipeline, nine inches in bore and twelve miles in length, was laid between the salt-wells of East Tawas and the lumber-mills at Oscoda; it is expected that it will supply brine enough for the daily manufacture of one thousand barrels."

Also: "The best qualities of Michigan salt sell promptly for dairy and family use, and are especially adapted to the wants of packers of meats and fish. The inferior grades are branded as such, and sold for salting stock and hides, and similar purposes, while an increasing market has opened for refuse salt as a fertilizer. Shipments in bulk and in sacks have recently begun."

In 1880 the average price of Michigan salt was 75 cents per barrel, and in 1881, 83½ cents—Saginaw salt averaging 90 cents.

The Marquette "Mining Journal" gives full statistics of the product of the Upper Peninsular iron-mines for 1881, and also a table of the aggregate production of the mines and furnaces, in gross tons, since 1856, and the value of the same. The product for the last five years is appended, and also the total for the twenty-six years:

YEARS.	Ore.	Pig-iron.	Ore and pig.	Value.
1877.....	1,025,129	29,685	1,054,814	\$5,299,598
1878.....	1,125,093	17,404	1,142,497	6,884,482
1879.....	1,418,182	39,583	1,457,765	11,413,114
1880.....	1,957,598	48,523	2,006,121	19,457,427
1881.....	2,321,815	52,953	2,374,268	20,498,618
26 years.	17,642,443	843,251	18,485,694	\$188,592,275

The value of the quartz product of 1881 was \$75,713, giving a total production for the year of \$20,573,713.

Six mines raised ore exceeding \$1,000,000 each, as follows: Republic, \$2,337,860; Lake Superior, \$2,185,578.50; Cleveland, \$1,886,405.50; Champion, \$1,454,270; Chapin, \$1,076,168; Indiana, \$1,024,500.50.

The following table, from the same paper, shows the product of the Lake Superior charcoal-furnaces in 1881, with its value in market:

NAME OF FURNACE.	Gross tons.	Value.
Pioneer.....	17,030	\$510,900
Menominee.....	8,336	250,080
Florence.....	714	21,420
Carp River Iron Company.....	10,253	307,590
Jackson.....	4,680	140,400
Deer Lake.....	7,881	234,930
Martel.....	4,109	123,270
Total.....	52,953	\$1,588,590

Concerning the out-put of the copper-mines of Lake Superior for 1881, the "Portage Lake Mining Gazette," of January 5th, said: Below will be found the yield of the leading mines of this district for the year ending December 31, 1881:

MINES.	Tons.	Pounds.
Calumet and Hecla.....	19,462	432
Quincy.....	3,407	1,455
Oscoda.....	2,408	880
Atlantic.....	1,815	1,995
Franklin.....	1,614	190
Pewabic.....	1,123	1,550
Allouez.....	969	1,845
Copper Falls.....	459	810
Hancock.....	446	508
All other sources, including Central, Phenix, Conglomerate, and St. Clair mines, the Ontonagon district and tributaries, about.....	2,400
Total.....	34,102	1,195
Product in 1880.....	31,500
Excess in 1881.....	2,602	1,195

Estimating the mineral yield for 1881 at 80 per cent ingot, the "Northwestern Mining Journal" (published at Hancock) tabulates the total production of mines named since the beginning of mining operations:

MINES.	Tons, ingot.
Atlantic.....	10,537
Calumet and Hecla.....	142,127
Franklin.....	16,843
Hancock.....	1,760
Huron.....	3,970
Oscoda.....	9,928
Pewabic.....	12,419
Quincy.....	29,475
Total.....	226,559

The writer adds: "At twenty cents per pound, the united product of the above-men-

tioned mines has amounted to nearly ninety-one million dollars, and every one of them today is in better condition to produce plentifully and profitably than ever before."

In advance of his annual report the Secretary of State furnishes the following crop and farm statistics. The first table compares the products of 1879 and 1880; and the second, 1880 with 1881:

PRODUCTS.	1880.	1879.
Wheat, acres harvested.....	1,768,475	1,695,636
Wheat, bushels raised.....	30,603,075	30,983,340
Wheat, average bushels per acre.....	17-80	19-30
Corn, acres harvested.....	741,404	742,559
Corn, bushels raised.....	45,505,111	42,764,128
Corn, average bushels of ears per acre.....	61-38	57-57
Oats, acres harvested.....	466,245	440,728
Oats, bushels raised.....	13,914,738	15,089,855
Oats, average bushels per acre.....	29-85	34-25
Clover-seed, acres harvested.....	71,492	194,399
Clover-seed, bushels raised.....	82,324	813,063
Clover-seed, average bushels per acre.....	1-16	1-61
Barley, acres harvested.....	34,302	44,007
Barley, bushels raised.....	652,698	991,659
Barley, average bushels per acre.....	19-08	22-53
Peas, acres harvested.....	27,533	33,079
Peas, bushels raised.....	406,793	537,732
Peas, average bushels per acre.....	14-60	15-95
Potatoes, acres harvested.....	88,298	69,441
Potatoes, bushels raised.....	8,815,757	8,025,475
Potatoes, average bushels per acre.....	98-84	89-13
Hay, acres harvested.....	945,426	949,371
Hay, tons raised.....	1,140,754	1,051,115
Hay, average number of tons per acre.....	1-21	1-11
Sheep, number sheared.....	1,965,952	1,928,530
Wool, pounds sheared.....	10,724,107	9,552,034
Wool, average number lbs. per head.....	5-45	5-23
Apples, bushels sold.....	1,831,910
Peaches, bushels sold.....	229,570
Grapes, pounds sold.....	2,956,437
Cherries, currants, plums, and berries, bushels sold.....	161,316

Fruit statistics not compiled at date of Secretary's communication, but the product of 1880 was much larger than that of 1879.

FARMS, STOCK,* ETC.	1881.	1880.
Farms, number of.....	119,769	113,941
Farms, acres of improved land in.....	6,374,885	6,217,209
Farms, acres of unimproved land in.....	4,703,393	4,761,058
Farms, total number of acres in.....	11,077,165	10,977,105
Farms, average of acres in each.....	92-40	92-19
Wheat, acres now on the ground.....	1,783,819	1,832,366
Horses, number of.....	905,591	293,210
Milk-cows, number of.....	311,800	304,142
Cattle, other than milk-cows, No. of.....	322,231	344,791
Hogs, number of.....	424,795	465,629
Sheep, number of.....	2,095,408	1,892,311
Apple-orchards, number of acres in.....	Not complete.	226,849
Peach-orchards, number of acres in.....	13,901

Varnum B. Cochran, appointed by the Governor to be Superintendent of Public Instruction, *vice* Superintendent Gower, resigned, to accept the superintendency of the State Reform School for Boys, furnishes the following school statistics from the advance-sheets of his annual report:

Number of districts, September, 1881.....	6,524
Increase over previous year.....	172
Number of school-houses.....	6,573
Increase over previous year.....	173
Number of children between five and twenty years of age.....	518,317
Increase during the year.....	12,096
Number of children attending public schools.....	371,613
Increase over previous year.....	9,057

* Does not include live-stock in cities, except in a few cases.

Number of sittings in public schools.....	454,514
Increase over 1880.....	8,485
Number of private and select schools.....	252
Number of teachers employed, male.....	4,024
Number of teachers employed, female.....	10,445
Increase over 1880.....	520
Wages paid teachers.....	\$2,024,626 99
Increase over 1880.....	106,648 00
Estimated value of school property.....	9,883,951 00
Amount on hand from previous year.....	637,035 50
Amount received from one-mill tax.....	507,111 88
Amount received from primary-school fund.....	512,209 44
Library moneys.....	18,818 95
Amount received as tuition of non-residents.....	35,119 02
Amount received from district taxes.....	2,283,823 97
Amount received from all other sources.....	283,200 66

Total receipts of the year.....	\$4,301,818 92
Amount carried forward to next year.....	884,215 44
Expenditures, including wages of teachers, payments on debts, buildings, etc.....	3,417,598 48

Total expenditures of the year..... \$4,301,818 92

The attendance of students at the State Normal School during the school year 1880-'81 was 492; number of graduates in 1881, 90; number of instructors, 12. Ordinary receipts, \$23,835.02; expenditures, \$24,066.62. Additional buildings and permanent improvements, \$24,066. Students thoroughly prepared to take work in the higher classes can complete the professional course in one year, though the authorities advise that the courses marked out for the last two years be pursued in the school.

The President of the State Agricultural College gives the number of students in attendance during the year as 228, classified: Resident graduates, 4; seniors, 35; juniors, 33; sophomores, 53; freshmen, 90; in select studies, 13. The number of graduates, 13. An additional professorship was created and filled—that of History and Political Economy. A library and museum-building, an enlargement of the chemical laboratory, and several farm-buildings are in process of construction, appropriations having been made by the Legislature of 1881. The appropriations for buildings and current expenses were \$50,969.50. The trust fund, September 30th, was \$173,478.88, having increased during the year \$20,341.18. The interest from the trust fund and on the part-paid lands amounted for the fiscal year to \$20,000.30; 6,528-97 acres of Agricultural College lands were sold, during the year ending September 30th, for \$26,007.25. The number of acres remaining unsold at same date was 146,803-97. The price of the college lands has been increased to \$5 per acre.

The annual report made by the acting president to the Board of Regents of the Michigan University chronicles a very prosperous year. The number of students registered and catalogued was 1,534, an increase of 104 over the preceding year. These students are classified: Department of Literature, Science, and the Arts, 521; Department of Medicine and Surgery, 380; Department of Law, 371; School of Pharmacy, 88; Homoeopathic Medical College, 88; College of Dental Surgery, 86. In the Department of Literature, Science, and the Arts, there were 7 candidates for the degree of Civil Engineer, 28 for that of Bachelor of

Letters (English), 58 for Bachelor of Science, 15 for Bachelor of Philosophy, 77 for Bachelor of Letters (Latin), and 240 for Bachelor of Arts. Of the 210 new students in this department, 75 were admitted on diplomas given by the high-schools of the State, the standing of which schools is yearly passed upon by the faculty, on the recommendation of committees appointed to visit and examine the schools. During the year 431 degrees were conferred on examination: 96 upon the graduates from the Department of Literature, Science, and Arts; 33 from the School of Pharmacy, 99 from the Department of Medicine and Surgery, 145 from the Department of Law, 21 from the Homœopathic Medical College, and 37 from the College of Dental Surgery. Eight honorary degrees were conferred. During the year a School of Political Science was organized, and is now in full operation. The first announcement contained a list of ten professors and lecturers, and the following curriculum of instruction, subject to changes and additions as experience shall make necessary:

1. Theories of political economy.
2. General political history of Europe from the Renaissance to the French Revolution.
3. Political and social history of England from Henry VI to Charles I.
4. Political history of America before the adoption of the Constitution of the United States.
5. The laws of public health.
6. The elements of constitutional law.
7. The science of forestry, and its relations to national economy.
8. Political history of England from Charles I to George III.
9. Practical questions in political economy.
10. General theories of international law.
11. Theories of taxation and public revenue.
12. History of political forms and political methods.
13. Constitutional history of the United States.
14. The political history of England from George III to the present time.
15. The management of reformatory and penal institutions.
16. Practical questions in social science.
17. Political ethics.
18. Political theories and methods of the English Government.
19. The constitutional history of England.
20. Civil service in Europe and in the United States.
21. The government of cities.
22. The history of financial theories and financial methods.
23. The history of political ideas.
24. The history of modern diplomacy.
25. Comparative politics of the larger nationalities of Europe.
26. Comparative constitutional law of Europe and the United States.
27. Comparative administrative law of the several states of Europe and of the American Union.

Several additions were made to the faculties, and the library liberally increased during the year. The Legislature made, in addition to other liberal appropriations, an appropriation of \$100,000 for a library-building. Plans for the same have been adopted, the contract let, and the work is in progress. The receipts for the year, including balance on hand, October

1, 1880 (\$19,067.24), were \$231,338.90. Expenditures, \$224,076.12. Cash balance, September 30, 1881, \$7,268.78.

The statistics of the Michigan Asylum for the Insane show:

PATIENTS.	PATIENTS.		
	Males.	Females.	Total.
Patients in Asylum, October 1, 1880....	800	357	657
Patients admitted during the year.....	113	57	170
Whole number treated during the year.....	413	414	827
Discharged during the year.....	47	46	93
Died during the year.....	23	23	51
Remaining September 30, 1881.....	385	345	683

Amount received for the support of patients during fiscal year, \$150,728.77. Disbursed for same purpose, \$138,632.64. The cost per week per capita was \$3.92½.

In a personal letter covering these statistics, the medical superintendent says: "The type of insanity within the last twenty years has materially changed in those admitted to this institution. While the number suffering from mania, or the more active forms of disease, has diminished, the number brought to us afflicted with obscure nervous disorders has largely increased. The same is true of those of defective organizations. These are facts having an important bearing upon the welfare of the race, and suggest that other agents more potent in their depressing effects are acting upon the nervous system, which at first produces functional disturbance, but if continued, ultimately, by impairing nutrition, produces organic changes that yield but imperfectly to treatment. In brief, we may say that these fatal forms of nervous disorders are due, in a great measure, to our fast and intense way of living."

The statistics received from the Eastern Asylum for the Insane cover the same period, the fiscal year ending September 30, 1881, and are:

	PATIENTS.		
	Males.	Females.	Total.
Under treatment October 1, 1880.....	231	212	443
Admitted during the year.....	85	72	157
Whole number treated.....	316	284	600
Discharged, recovered.....	29	18	47
Discharged, improved.....	20	18	38
Discharged, unimproved.....	22	13	35
Temporarily absent.....	8	8	16
Under treatment September 30, 1881.....	240	231	471

Receipts for the fiscal year..... \$127,720 04
Expenditures for the fiscal year..... 122,149 50

The acting medical superintendent adds: "In regard to predisposing causes, heredity is much greater than any other. The following figures will illustrate this point, and may not be without interest. Of the 833 patients treated here, 362, or 43·457 per cent, have insanity in family, either direct or remote. One hundred and twenty-nine cases, or 15·486 per cent, have no insane relatives. It is often impossible, however, to obtain any information concerning the ancestry of a patient further back than one generation. Three hundred and sixteen cases, or 37·935 per cent, are unascertained, and 26 cases, or 3·121 per cent, are un-

classified. If the histories of the patients included in the last two classes could be ascertained, no doubt a large number of them would show an inherited tendency to mental disease."

In his recent annual report, the Auditor-General discusses the financial workings of the law which commits to county authorities the determination of the indigence of insane persons, the expense of their support at the asylums being paid by the State after the counties shall have supported them at the asylums for two years. That officer concludes that, if the State is to pay the bills, its officials should have something to do with making them, and that county officials would use more care in pronouncing insane persons indigent if their support was to devolve upon the counties for an indefinite term of years. He says:

Perhaps the results of this law can be more forcibly illustrated by comparison. For twenty years, from 1859 to 1878, inclusive, the receipts of the Michigan Asylum, for all purposes other than building, were, from private sources, eighteen per cent, and from State and counties, eighty-two per cent. For three years, 1879 to 1881, inclusive, the receipts of the same asylum for the same purposes were, from private sources, ten per cent, and from State and counties, ninety per cent. Indicating that under the new law, where the counties bear the expenses of the indigent insane for only two years, nearly twice as many insane persons are declared indigent by the county authorities as there would have been during the same period had the old law remained in force.

Owing to its recent organization, the same comparison can not be made with the Eastern Asylum. But the receipts for the years 1880 and 1881 for all purposes other than building were, from private sources, only six per cent, and from State and counties, ninety-four per cent.

Copious quotations are made from the reports of the State Asylums for the Insane, and the Auditor-General continues by drawing the following conclusions from what has been here given, and from other data necessarily omitted:

That the tendency is toward bringing all the insane of the State into State asylums.

That if this were an accomplished fact to-day, the biennial tax levy for their support alone would be, in round numbers, \$600,000.

That ten years hence (1891) the number of insane will have increased to 4,170, and the biennial tax levy for their support alone will then be upward of \$1,000,000.

The Superintendent of the State Public School, at Coldwater, furnishes the following statistics for the fiscal year ending September 30, 1881:

Received during the year.....	137
Placed in families during the year.....	112
Died during the year.....	2
Discharged during the year.....	24
Remaining September 30, 1882.....	884
Average attendance during the year.....	804
Operating expenses of the year.....	\$35,887 90
Cost per capita.....	\$116 42

Whole number of inmates during the seven and a half years since the school was opened, 1,081. Of this number 637 have been indentured, seven are out in families on trial, 112 have been returned to their counties, five have absconded, and 30 have died. A large percentage of those returned to their counties

were diseased or of feeble intellect, and should not have been sent to the school. Of the whole number placed in families but 63 have run away, many of whom are reported doing well and caring for themselves. Recent reports from 300 of those remaining in families are exceedingly encouraging, and the superintendent says, "It may be safely assumed, therefore, that leaving out those who were improperly admitted, being either diseased, mentally defective, or more properly subjects for the Reform School than for this institution, from 85 to 90 per cent will become in time respectable citizens."

The Principal of the Institution for the Deaf and Dumb, at Flint, reports for the fiscal year ending September 30, 1881: Number of pupils in attendance during the year, 279; completed course or discharged, 30; remaining in institution September 30, 1881, 249. Receipts from State Treasury, \$44,893.39; from earnings of shops, \$4,762.81; total, \$46,656.20. Expenditures: for current expenses, \$44,862.81; for improvements, \$1,793.39; total, \$46,656.20.

For the same period the new School for the Blind, now permanently located at Lansing, reports: Number of inmates or pupils enrolled during year, 55; number instructed in vocal music, 32; in instrumental music, 33; in literary studies, 55; in mechanical employments, 46. Teachers employed, six, classified: in literary department, two; in vocal and instrumental music, one each; in work department, two. The studies, aside from music, are: geography, arithmetic, object-lessons, reading and spelling, memorizing, writing, grammar, analysis, history, civil government, botany, natural philosophy, and geology. In the work department, the girls were instructed in knitting (by hand and machine), all kinds of plain sewing, crochet-work, a variety of fancy-work, and bead-work; and the boys in broom-making. Disbursements on account of current expenses, \$15,536.93.

The Michigan Reform School for Girls, located at Adrian, was opened for the reception of inmates in August, 1881. Two cottages have been completed, which will accommodate thirty-two inmates each, with the necessary officers and attendants. Three other buildings, two cottages and a school-house and chapel, for which the Legislature of 1881 appropriated \$54,250, are now being erected, and will be ready for use in the spring and summer of 1882. Girls between the ages of seven and seventeen years are to be sentenced to this school, on conviction before any court or magistrate "of being disorderly persons, or of any offense not punishable by imprisonment for life," unless "deemed incorrigible." Though a certificate of conviction is necessary to admission, the school is classed as strictly reformatory rather than penal, and provision is made for educating the inmates in house-keeping and needle-work, as well as in the primary studies of a school course; also for

placing girls in private families or apprenticing them until twenty-one years old, to which age all warrants of committal run. Number of inmates, forty, with a monthly increase of from five to ten. The experiment is yet a new one, and, though some most unpromising material has been received, the officials in charge of the school report satisfactory results "beyond all expectation." The governing board of the school consists, under the law, of "three women and two men."

C. A. Gower, the new Superintendent of the State Reform School (for boys), furnishes personal and financial statistics, as follows: Inmates of school, September 30, 1880, 316; received during year, 158; released, 165; remaining, September 30, 1881, 309.

Receipts—current expense fund..... \$54,932 42
special appropriations..... 17,556 06

Total..... \$72,788 48
Paid from current expense fund..... \$50,161 52
special appropriations..... 11,279 29

Total payments..... 61,441 11

Unexpended September 30..... \$11,347 37

Annual legislative appropriations for each year, 1881-'82, \$35,500. During the year a chapel has been erected, and in connection with the same a large reading-room has been fitted up, which the boys are permitted to use evenings. A "play-shed" has also been built, in which the boys engage in active sports during stormy weather.

The Warden of the State House of Correction and Reformatory reports:

Number of prisoners September 30, 1880..... 837
" received on sentence..... 836
" discharged by expiration of sentence..... 792
" discharged by order of court..... 26
" pardoned..... 8
" died..... 5
" escaped and not recaptured..... 5
" sent out as witness..... 1
" remaining September 30, 1881..... 856

The earnings of the prisoners for the year were: On contracts, \$22,212.39; on prison-work, \$18,252.81; total, \$40,495.19. The receipts for the year were: On account of building and special appropriations, \$8,618.18; on account of current expenses, \$53,968.82; total, \$62,587. Disbursements: On account of building and special appropriations, \$5,899.84; on account of current expenses, \$54,053.74; total, \$59,953.58. Excess of receipts over expenditures, \$2,633.42.

The following statistics of the State Prison are collected from the manuscript of the Warden's unpublished report:

Number of prisoners September 30, 1880..... 773
" received during the year..... 216
" discharged by expiration of sentence..... 261
" discharged by order of the Supreme Court..... 2
" pardoned by the Governor..... 13
" died..... 9
" escaped..... 4
" transferred to Detroit House of Correction..... 1
" remaining in prison September 30, 1881..... 699

Average length of sentence received during the year, three years, ten months, eight days.

Net earnings of prisoners..... \$91,767 75
Net expenditures..... 88,445 65
Net income..... \$3,322 10

Number of prisoners at work on contracts, September 30, 1881:

On wagon contract..... 110
" shoe contract..... 51
" barrel contract..... 52
" cigar contract..... 65
" agricultural-tool contract..... 171
Total..... 449

The remaining 250 prisoners are employed under the direction of the officers. The coal used in the prison (not in the shops, contractors furnishing their own power and fuel) is mined on the prison-grounds.

The sentences for the year were for the following offenses:

Against life and person..... 56
" chastity and decency..... 18
" property..... 147
Total..... 216

The offenses against life, both for the year and since 1847, the date of the abolition of capital punishment, are classified:

CRIME.	The year.	Since 1847.
Murder in first degree.....	3	97
Murder in second degree.....	1	103
Manslaughter.....	4	104
Assaults with intent to murder.....	12	256
Totals.....	20	560

There are now confined in prison:

For murder in first degree..... 36*
" murder in second degree..... 27
" manslaughter..... 18
" murderous assaults..... 57
Total..... 168

Or 25 per cent of the whole number sentenced for the offenses named.

The average term served by life-convicts is seven and a half years, or lower than the average term of service of men received on sentence of fifteen years.

The prison history of life-convicts is summarized:

Died in prison..... 43
Discharged by courts..... 17
Sent to Detroit House of Correction..... 5
Pardoned..... 88†
Escaped..... 4
Remaining in prison..... 50

At the last session of the Legislature a bill was passed by the House restoring capital punishment, which was indefinitely postponed in the Senate as soon as received in that body, without a word of debate, by a vote of eighteen to eight.

The population of the State, by counties, in 1880, as compared with 1870, was as follows:

* Includes one sentenced in 1848.
† The pardons were, with scarcely an exception, given to prisoners whose lease of life was about to expire.

MICHIGAN FIRES. On the 5th day of September, and several following days, destructive fires swept through the forests and fields of Huron and Sanilac Counties, in Michigan, burning dwellings, barns, churches, saw-mills, fences, orchards, farm-crops, etc. So rapidly did the flames spread that live-stock could find no place of refuge, and the loss of human life was great. A number of small villages were completely wiped out. In several townships houses enough were not left standing to give temporary shelter to the homeless; and the suffering of men, women, and children was great before temporary relief could reach them. The smoke was so dense that day was turned into night, even at a distance from the burning forests, while at other times the whole heavens seemed in flames. Eye-witnesses described great sheets of fire rolling over their heads, jumping from forest to forest, leaving here and there a house or barn as a landmark and a wonder. In some sections high winds prevailed, and acres of forest had every tree turned up by the roots, while other acres, near by, showed the blackened trunks erect. Men and women fought desperately to save their homes, and in some instances succeeded for the second and third time, to be baffled at last. In the town of Paris, Huron County, settled largely by Poles, the one which suffered the heaviest, both in life and buildings, reporting twenty-three lives lost and one hundred and seventy-two families burned out, it was said that the inhabitants, impressed with the conviction that the last day had come, gave up in despair, and made little effort to save their homes. The fire broke out simultaneously in many places, and everywhere from the same

cause, the setting fire to brush and log heaps, the settler's mode of clearing up his farm, and ran through twenty-two townships in Huron County and twenty-six townships in Sanilac, working greater or lesser devastation, according to the material it found to feed upon. The adjoining counties of Lapeer, St. Clair, and Tuscola, suffered from similar fires, but with no loss of life, and, in comparison, a limited loss of property.

Nearly eighteen hundred square miles of territory, or full one million acres, were burned over, being principally included in a belt sixty miles in length north and south, and from ten to thirty miles in width; the fires in Lapeer and Tuscola Counties lying west of that belt.

When the first relief agents penetrated the burned region the thousands of homeless people were found massed in the unburned school-houses, dwellings, or barns; at Bad Axe, the county-seat of Huron County, in the courthouse; in improvised buildings, constructed of the planks from half-burned bridges, logs, or rails, thatched with cornstalks, and in some instances in dug-outs, or without any shelter. With the living were found the charred remains of the unburied dead, with men, women, and children so badly burned, though yet alive, that they could scarcely be recognized. A general relief committee was organized at Detroit, and another at Port Huron, with independent or sub-committees in almost every city and town in the State, and but a few days passed before the wants of the suffering were temporarily relieved, the dead buried, the burned and sick provided for in hospitals, and the work of permanent relief systematically entered upon. The citizens of other States also entered generously and earnestly upon the work, and poured money, goods, clothing, and provisions into the store-houses and treasury of the local committees with an unsparing hand. The Southern States vied with the Eastern, and

The third table (recapitulation) gives the losses by counties, including the estimated losses in Lapeer, St. Clair, and Tuscola Counties. These statistics vary but little from those gathered by the State Commission. In addition to the above, forty school-houses were burned, twelve in Huron County and twenty-eight in Sanilac; also eight churches, six in Huron and two in Sanilac.

In the matter of relief, the Port Huron Committee report receipts up to February 11, 1882:

Cash subscriptions.....	\$192,831 44
Produce, clothing, and other supplies.....	255,960 26
Total.....	\$448,791 70
The Detroit Relief Committee reported receipts to Oct. 10, 1881:	
Cash subscriptions.....	\$207,274 89
Produce, clothing, and other supplies.....	74,736 83
Total.....	\$282,010 72
State Relief Commission—successor to Detroit Relief Committee, by appointment of the Governor—to February 11:	
Cash subscriptions.....	\$199,300 05
Estimated supplies.....	76,000 00
Total.....	\$275,300 05
Total cash and supplies.....	\$1,006,102 47

In addition, Bay City, the Saginaws, and other cities of the State sent large contributions, both in money and supplies, to the local committees at different points.

The Commissioner of Insurance says in his preliminary report for 1881 that the losses were but slightly covered by insurance. Also, "the two mutual companies of those counties had about \$80,000 of losses, none of which have been paid. Only twenty stock companies had losses in the burned district, aggregating \$101,942.66. This amount was promptly paid, nearly one half by a single company, the Agricultural Insurance Company, of Watertown, N. Y."

The matter of further relief will be laid before the Legislature at an extra session, to be held February 23, 1882, and it is estimated that an appropriation of \$300,000 will be needed to meet the taxes levied upon the property of the sufferers under assessments made or ordered before the fire, and to furnish the seed for spring crops, and other supplies necessary, until the harvest of 1882 can be gathered. The unusually mild winter has proved exceedingly

favorable, as the hastily constructed houses—many of them rude shanties—were naturally not fire-proof.

MINNEAPOLIS AND ITS MILLS. Minneapolis, Minnesota, situated at the Falls of St. Anthony, of the Mississippi River, has become the most important milling center of the Northwest. Power of immense capacity is supplied from the Mississippi River, which is nearly one thousand feet wide at this place, has a fall of seventy-five feet within the space of a mile, and has been utilized to the supply of twenty-eight flouring-mills and several saw-mills. With the help of a grant from the Government of the United States, the gradual recession of the falls from the wearing away of the soft sandstone which forms part of the river-bed has been arrested by the construction of a subterranean wall of concrete across the river behind the falls, and for a distance of fifty feet into the banks on either side, and by covering the falls themselves with heavy crib-work filled with stones, and a flooring of timber. At a short distance above the falls, the water is turned into a canal sixty feet wide and fourteen feet deep, by which it is carried in a course parallel with the river to the mills. The mills have a capacity which demands twenty million bushels of wheat in a year, a quantity representing an area of 1,250,000 acres of land in cultivation. The grain is purchased by agents representing an association of the millers, who canvass the tributary wheat-growing districts for three months after the harvest of each year, to secure the bulk of the year's supplies, and forestall the competition of Eastern speculators. The wheat is distributed among the several mills in proportion to their capacity for grinding. While waiting to be ground it is stored in the mills, which can take care of about 2,500,000 bushels; in the elevators of the city, which can hold about half that amount; and at outlying stations on the various lines of railway. The hard spring varieties of wheat are most sought after for making into flour, and this has raised the value of those varieties over that of winter wheat, which formerly commanded the highest price.

The total productive capacity of all the mills is computed at 28,000 barrels of flour a day. The three mills of Messrs. Washburne, Crosby & Co. possess a motive force of 3,550 horse-

* Not in Port Huron district—losses estimated from best sources available.

power, have a capacity for making 6,500 barrels of flour daily, and employ 281 persons. Their new A mill of seven stories is carried up in two distinct buildings, communicating by wrought-iron fire-proof doors, and is fitted with thirty run of stone, sixty sets of rollers, and machinery for making the largest possible quantity of flour of the best quality attainable from a given quantity of wheat. The old-fashioned, rude grinding of wheat and separating the flour is replaced by methods that have been elaborated with great skill, and which involve many processes, employing varied machinery and ingenious appliances. The chief objects sought to be attained are the gradual breaking and bruising of the grain so as to keep the broken particles rough and "alive"; repeated reductions of the middlings, or that part of the grain that lies immediately below the husk, which, formerly treated as of inferior quality, is now made to yield the strongest and best flour; the separation of every part of the flour from the bran; and the judicious blending of the flour obtained from the several reductions. The wheat, cleaned by blasts, is separated into lots of similar sizes; the fuzzy tails are removed by ending-stones. The grain is then passed through corrugated, chilled-iron rollers, the corrugations of which range from eight to forty to the square inch, which bruise the grain without grinding it. This is on the ground-floor. The bruised grain is thence raised to the bolting-machines, where it is passed through gauze cloths of different textures, and whence it is sent down between finer corrugated rollers running at a speed of from one hundred and fifty to three hundred revolutions per minute. These processes of reduction and sifting are repeated six or seven times, the third giving more flour than the first two reductions, and the fifth giving the best rising flour and the strongest in albuminoids. About ten different grades of flour are produced by these reductions, some of them being mixed grades. As precautions against accident, electric bells are connected with different parts of the machinery, to give the alarm on the occurrence of any choking or other misadventure; and suction-pipes pass from the stones and rollers to prevent heating of the rapidly revolving surfaces, and to carry the dangerous explosive dust into the upper stories, where it is received by webs of flannel, and is swept off and driven into a discharge-tube by the automatic working of a traveling brush. The warm air, thus separated from dust, is returned to the mill and made to aid in reducing the cost of heating. An electric process has been tried for separating the flour from the bran, but was found not to be effectual; and a cleaner is used, consisting of iron disks fitted with pegs, one set of which is stationary, the other revolving at the rate of two thousand revolutions in a minute, which strips every particle of flour from the woody husk. The bran is packed, while still fresh, in bags containing two hundred pounds each, and is sold

generally to dairymen, at prices ranging from \$6 at the mill, to \$12 for two thousand pounds at other places.

C. A. Pillsbury's A mill will be, when finished, the largest mill in the world, and when fully equipped will require a daily supply of 25,000 bushels of wheat. It is 180 feet long, 115 feet wide, and 117 feet high to the wall-plate. The foundation side-walls, of limestone, are eight and a half feet thick, and the walls even as high as the seventh story are two and a half feet thick. In the basement are the massive fore-bay to convey the water from the canal especially built for this mill, the flumes, and provision for the turbine-wheels. Seventeen thousand cubic feet of water rush every minute with a fall of fifty-three feet down each flume, and communicate to each turbine-wheel an estimated force of 2,400 horse-power. The mill is intended to contain, when completed, twenty pairs of stones, with Behem's patent exhausts; three hundred sets of rollers, half of them corrugated, half smooth, for finishing work; two hundred purifiers, fitted with Hardenberg's dust-catchers; dust-machines and separators of various kinds. Mr. Washburne, of Washburne, Crosby & Co.'s mill, says that, with skillful management of the modern machinery, he is able to procure as fine flour from No. 3 or No. 4 wheat as was formerly obtained from No. 1 or No. 2. A varying proportion of different kinds of flour is made, according to the demand and the quality of wheat used. The ordinary out-put is forty per cent of patent, fifty per cent of baker's, and ten per cent of low-grade flour. The foreign export trade did not exist five years ago. The Washburne mills now send thirty per cent of their product abroad, chiefly as baker's flour. Belgium and Germany have hitherto taken large consignments, especially of low grades; but it is anticipated that the increased duties will now shut inferior brands out of Germany. Mr. Pillsbury sends nearly half of his flour to Europe, the most of it as baker's flour. Many English bakers are said to use a mixture of three parts of St. Louis flour with one part of the stronger Minneapolis flour. From two hundred and eighty to three hundred pounds of wheat, according to the quality, are used to make a barrel of flour. The bran, which is estimated to constitute from eighty to ninety per cent of this quantity, is expected to pay the expense of the grinding, etc., and will do so when it can be sold for its full price.

Besides the extensive system of flouring-mills, seventeen lumber-mills are in operation at Minneapolis, producing about 2,500,000 superficial feet of lumber during the season. The timber that is used is got chiefly from around the lakes and the river-banks three hundred miles up the Mississippi and its tributaries, and is nearly all white pine. Some oak and maple are brought by railroad from the Eastern States, and walnut and cedar are brought in small quantities from Missouri. The logs are drift-

ed or rafted on the spring floods to the main boom, a few miles above the city, where 100,000,000 feet may be stored, and whence they are taken, when needed, according to the owners' marks upon them, to the several mills. When at full work, the mills on the two sides of the river cut up a million feet a day.

The whole number of mills and their capacity have more than doubled since 1870, and the population of the city has increased from 18,079 to 60,000.

MINNESOTA. The Legislature, consisting of 29 Republicans, 11 Democrats, and 1 Greenbacker in the Senate, and 86 Republicans, 16 Democrats, and 4 Greenbackers in the House, assembled at the beginning of the present year and adjourned on the 9th of March. On the 19th of January S. J. R. McMillan, Republican, was re-elected United States Senator. The most important act of the session was the one providing for the settlement of the old railroad bonds at fifty cents on the dollar. The history of these bonds was summarily as follows:

In March, 1857, Congress granted to Minnesota six alternate sections of land per mile to aid the construction of six different lines of railroad. This grant was divided among four different railroad companies. The sanguine expectations excited by this liberal grant were suddenly cut short by the financial crisis of 1857, followed by the general suspension of Western railroad enterprises. In this emergency the railroad companies applied to the Legislature for aid. After a winter of active discussion a constitutional amendment was submitted by the Legislature to the people for a loan of State credit to the several companies. On April 15, 1858, the amendment was adopted by a vote of about 35,000 for to 8,000 against. It authorized the bonds of the State to be issued to the four companies (not to exceed \$1,250,000 to each company, or \$5,000,000 in all) as construction advanced, at the rate of \$10,000 per mile for each mile of graded road, and \$10,000 for each mile of completed road. The amendment pledged the faith and credit of the State for the payment of the bonds in the event that the companies should make default in the payment of the interest or principal, and as security therefor exacted certain securities from the companies. Among others, first, a conveyance to the State of the first two hundred and forty sections of land to which each road was entitled prior to construction; and, second, a first mortgage on all the lands, franchises, etc., of the several roads, and to this was added a general penalty of forfeiture. The companies proceeded to grade the roads, and bonds therefor were issued to the amount of \$2,275,000, when further construction was suspended. The companies found themselves unable to negotiate the bonds at prices sufficient to enable them to go on with the work. They defaulted in the payment of the interest on the bonds—when in 1860 the State, through its then Governor, foreclosed its mortgage on the lands, franchises, road-bed, etc., and took possession of the same. Though the constitutional amendment provided that these securities should be devoted to the payment of the interest and principal of the bonds, the Legislature proceeded soon after to turn over these lands and franchises to other companies free of all lien. The Legislature of 1860 proposed two constitutional amendments which were adopted in November of that year, one of which provided that there should be no further issue of bonds under the loan amendment, and that it should be expunged from the Constitution, reserving to the State all rights, remedies, and forfeitures accruing thereunder. The other was an amendment to section 2, Article IX, of the Constitution, in the following words:

"But no law levying a tax or making other provisions for the payment of the bonds, denominated Minnesota State railroad bonds, shall take effect or be in force until such law shall have been submitted to the people and adopted by a majority of the electors voting for the same."

Immediately following the adoption of these amendments, the public attention was engrossed by the war for the Union and the Indian war. It was not till 1866 that any further action was taken by the Legislature. In that year an act was passed for the appointment of three commissioners to ascertain what the bonds cost the holders, and on what terms they would surrender them to the State.

At the next session of the Legislature, 1867, an act was passed to provide a sinking fund for the adjustment of the bonds, from the proceeds of the internal improvement lands. The minimum price of the lands was fixed at \$3 per acre, and they were to be appraised and sold in the same manner as school lands. The act provided that whenever the sinking fund should amount to \$20,000, but not oftener than once a year, the State Treasurer should advertise for proposals from the bondholders for the surrender of an amount of bonds in exchange for said money; the person offering his bonds at least price to be entitled to the money. This act, submitted to the people in November, was rejected.

In 1870 the Legislature passed an act ostensibly setting apart the proceeds of the 500,000 acres of internal improvement lands, but really the lands themselves, for the payment of the bonds. The act required 2,000 of the bonds to be deposited with the State Auditor on or before the first Wednesday in September—with all unpaid coupons attached, with a written contract on the part of the owner agreeing to purchase such lands to the extent of the bonds so deposited, and in case of failure to purchase, authorizing the Auditor to set apart an amount of lands which, at the minimum price, fixed at \$8.75 per acre, would equal the bonds and coupons so deposited. In other words, each bondholder was required to be on hand to select and purchase, for the sum of not less than \$8.75 per acre, an amount of lands equal at that price to the amount of his bonds and coupons, or, if he could not do it himself, to allow the State Auditor to do it for him.

This proposition was ratified by the people, but when the first Wednesday of September came it was found that less than 2,000 of the 2,275 bonds had been deposited with the State Auditor, and this adjustment fell through. Selah Chamberlain and other bondholders accepted this proposition and deposited their bonds, but a minority either refused or failed to accept.

At the next session of the Legislature in 1871 another act was passed to test the validity and provide for the adjustment of the bonds so deposited. Under this act the Governor was empowered to appoint three disinterested persons learned in the law, either residents or non-residents of the State, to constitute a board of commissioners to determine whether the bonds were a legal and equitable obligation of the State, and if so to ascertain and award the amount due upon such bonds upon the basis of the cost of such bonds to the holders thereof, with interest upon the cost at the rate of 7 per cent per annum, and to file their determination with the Governor before July 1, 1871.

In case the commissioners decided that the bonds were a legal obligation against the State and should award the amount thereof on the basis of the cost to each holder, new bonds were to be issued in lieu thereof at the rate of 2 per cent the first year, 3 per cent the second, 4, 5, and 6 respectively for the subsequent three years, and 7 per cent thereafter. The tax on the gross earnings of the railroad companies was set apart to pay the interest and principal of the new bonds. This proposition, the only one ever made by the Legislature for a quasi-judicial determination of the legal validity of the bonds, was rejected by the people. In March, 1878, the Legislature passed

another act providing that the 500,000 acres of internal improvement lands, and the funds arising therefrom, should be exchanged for the bonds and unpaid coupons and other claims, at a rate which should make the whole amount of lands equal to the whole amount of bonds and other claims, each bondholder to have a preferred choice of lands in the order in which his bonds were deposited—the funds derived from the sale of the lands or stumpage to be treated in the same way. This act was submitted to the people in November, 1878, and was rejected by a majority of the popular vote.

The act under consideration is the fifth attempt at adjustment, and provides for submission to the people only in the event that the tribunal of five judges to which the question is submitted shall decide that the constitutional amendment providing that no law for the payment of the principal or interest of the bonds shall take effect until approved by a majority of the popular vote thereon is valid.

The questions involved were submitted to the Supreme Court during the summer, which decided the act to be void, on the ground that it contained a delegation of legislative power to the tribunal, whereas the Legislature should itself have taken the responsibility of deciding upon the validity of the amendment. But the Supreme Court at the same time held the amendment of 1860 invalid, as contravening that clause of the Federal Constitution which prohibits any State from impairing the obligation of contracts. The court held that the requirement that all acts on the subject should be submitted to the people affected, not merely the remedy, but the obligation. This decision left the Legislature free to settle the question of these bonds without submitting its acts to the people. The Governor accordingly called an extra session, which began on the 11th of October, and continued for thirty-nine days. The Governor, in his message to this session, says as follows:

My individual preference is that every dollar of the debt represented by the Minnesota State railroad bonds should be paid in full, principal and interest. I believe that no course short of this is consistent with the honor and integrity of a sovereign State, so far as relates to its own voluntary action. But inasmuch as the holders of the bonds have upon their own motion proposed an adjustment upon more favorable terms, an opportunity is presented for discharging the whole debt by partial payment, without any necessary compromise of our good name.

The practical question simply is whether we shall now save some \$4,000,000 to the State without loss of honor, or incur the reproach of repudiation, keeping going a source of constant annoyance and an opportunity for political jugglery, and in the end pay the debt in full; for it can not be possible that an intelligent and progressive people, with moral and religious convictions, can refuse the final payment of an honest debt. An individual who does this while able to pay, justly incurs the scorn of his honest neighbors. What must be thought of a prosperous State that does it, using its sovereignty as its shield?

The holders of more than \$2,000,000 of the whole issue of \$2,275,000 have deposited their bonds with the State Auditor, accompanied with a written agreement to accept, in new bonds or cash, 50 per cent of the nominal amount of such surrendered bonds and coupons, in accordance with the act of last March. Many of the bondholders have demanded the return

of their bonds since the decision of the Supreme Court, which demand has been refused on the ground that the contract remains binding upon the parties, the decision having affected only the means of performance, and that the bonds can not fairly be withdrawn until the Legislature shall have taken action in the matter. Others, while still offering liberal concessions, express their unwillingness to adhere to their original proposition in view of the decision of the Supreme Court and the marked enhancement of the value of their bonds; but Mr. Selah Chamberlain, the holder of about one half of these bonds, has adhered to his contract and renewed his proposition to accept 50 per cent of the amount in full satisfaction of his claim, on the express condition that the adjustment be consummated during the present year; and there is reason to believe that most of the other bondholders will adhere to similar terms of settlement if speedily concluded. We have thus an opportunity to honorably settle this debt upon terms of rare liberality; and it is because the soundest expediency and the imperative demands of justice thus unite to require prompt action that I have felt it my duty to convene you in extra session.

The act of the last Legislature, proposing an amendment to the Constitution devoting the proceeds of the internal improvement lands to the payment of the adjustment bonds has been rendered inoperative by the decision of the Supreme Court. It will, therefore, be necessary to promptly readjust and re-enact its provisions to conform to the new action to be taken, in order to submit the proposed amendment to the people at the approaching general election. The average price realized thus far for the lands sold is about \$7 per acre, and the fund from such sales already amounts to \$800,000. In view of the rapid settlement of the country it is believed that the total sum which will be finally realized from the sale of these lands will reach \$4,000,000, a sum nearly or quite sufficient to pay the whole indebtedness without recourse to taxation. That there may be no wrong impression on your minds regarding the whole amount due on these bonds, I would say that by a former decision of our Supreme Court, past-due coupons draw interest, as well as the bonds to which they are attached, and should interest be computed in accordance with this decision, the whole debt would amount, on December 1, 1881, to about \$8,200,000, and should the pending proposition be consummated, the saving to the State will thus be about \$4,000,000.

The Legislature promptly passed an act in accordance with the Governor's views, the first two sections of which are as follows:

SECTION 1. Any holder of said Minnesota State railroad bonds who desires to avail himself of the provisions of this act, must deposit his bonds and coupons with the State Auditor, accompanied by an agreement in writing, obligating himself to accept in lieu of said bonds and coupons and in full payment and satisfaction thereof, fifty per cent of the amount nominally due upon said bonds and coupons, less any deductions hereinafter provided for, in cash, or in new bonds of the State, as provided for in this act: *Provided, however,* That where there has been a compliance with the requirements of section one (1) of the act entitled "An act providing for the adjustment of the Minnesota State railroad bonds," approved March 2, A. D. 1881, the same shall stand and be considered as a compliance with the provisions of this section.

SEC. 2. It shall be the duty of the Governor and State Auditor to cause to be prepared new bonds of the State, which new bonds shall be styled Minnesota State railroad adjustment bonds, and bear date July first (1st), one thousand eight hundred and eighty-one (1881), and shall be of the denomination of one thousand dollars (\$1,000) each, and shall be, and on their face shall be made payable after ten years and not more than thirty years from their date, at the option of the State of Minnesota, in the city of New

York, with interest, after January first (1st), one thousand eight hundred and eighty-four (1884), payable semi-annually in the city of New York, at a rate not exceeding five per cent per annum, and shall have coupons attached for such interest, and shall pledge the faith and credit of the State to the payment thereof. Said new bonds shall be signed by the Governor and attested by the Secretary of State, under the great seal of the State, and the coupons shall have the names of the Governor and Secretary of State thereto, and the bonds shall be countersigned and registered by the State Auditor, and, upon being so executed, countersigned and registered, and as soon as practicable after the passage of this act, the Governor shall deliver to the several owners of the Minnesota State railroad bonds, their heirs or legal representatives, who shall have deposited their bonds with the State Auditor as aforesaid, such an amount of the new bonds as shall be equal to fifty per cent of the par value of principal and interest of said Minnesota State railroad bonds and the coupons thereto attached, on the first (1st) day of January, one thousand eight hundred and eighty-four (1884), less any deduction resulting from other provisions of this act, said interest to be computed at five per cent per annum after the passage of this act, and take from said several owners and holders of said Minnesota State railroad bonds so deposited as aforesaid, a release under seal, reciting the number and denomination of the State railroad bonds, which said new bonds are taken in payment and settlement for, and acknowledging full satisfaction from the State of all liability on said Minnesota State railroad bonds so owned and deposited by such person, which release shall be filed in the State Auditor's office. The first coupons shall be made payable on the first (1st) day of July, one thousand eight hundred and eighty-four (1884), and thereafter on the first days of January and July in each year, until the maturity of said bonds; provided that at its election the State may, and in case said bonds shall draw a less rate of interest than five per cent shall, in lieu of said bonds, pay cash (less any deduction as aforesaid) to the several holders of said Minnesota State railroad bonds so deposited as aforesaid, or any of them, a sum equal to fifty per cent of the par value of principal and interest of said Minnesota State railroad bonds and coupons on the day when said payment is made, taking the release under seal from the holder as in the case of delivery of bonds hereinbefore provided; and to that end the Governor, Auditor, and Treasurer of State are hereby empowered in their discretion to negotiate, at not less than par, the bonds to be issued under the provisions of this act, and apply the proceeds to the payment of said holders of Minnesota State railroad bonds, as hereinbefore provided. And for the purpose of carrying out the provisions of this proviso, said bonds may be made to bear interest from January 1st, A. D. 1882, payable semi-annually thereafter, and in case of the delivery of said new bonds, any fractional sum less than one thousand dollars may be paid in cash; and whenever any of said Minnesota State railroad bonds or the coupons thereof, or any bond of the State is paid, under the provisions of this act or otherwise, the Treasurer or officer paying the same shall stamp, or cause to be stamped, thereon in large letters the words "Canceled and paid," and on the first Monday in each month the State Treasurer shall in [the] presence of the Governor and State Auditor burn up all bonds and coupons that shall have been canceled and paid by him during the preceding month or any previous time, and said Treasurer shall keep the number and description of the bonds so destroyed, which shall be certified to be correct by said officers present at their destruction, and be included in the annual report of the State Treasurer.

The act also provides for the settlement on similar terms of certain judgments, and of certain claims against the railroad companies. By the close of the year nearly all of the bonds

had been taken up and settled in accordance with the terms of this act. An act was also passed providing for the application of the moneys of the internal improvement land fund to the payment of the principal and interest of the Minnesota State railroad adjustment bonds, which is to take effect if ratified by the people at the next general election. Another act provides for organizing the county of Kanabec, and fixes the county-seat at Brunswick. Acts were also passed for the assessment and taxation of telegraph and telephone lines, and for the uniform taxation of mining property and products. The State was divided into five congressional districts, as follows:

1. The counties of Houston, Fillmore, Mower, Freeborn, Steele, Dodge, Olmsted, Winona, and Wabasha constitute the first congressional district.
2. The counties of Faribault, Blue Earth, Waseca, Watonwan, Martin, Cottonwood, Jackson, Murray, Nobles, Rock, Pipestone, Lincoln, Lyon, Redwood, Brown, Nicollet, Yellow Medicine, Lac-qui-Parle, Sibley, and Le Sueur constitute the second congressional district.
3. The counties of Goodhue, Rice, Dakota, Scott, Carver, McLeod, Meeker, Kandiyohi, Renville, Swift, and Chippewa constitute the third congressional district.
4. The counties of Washington, Ramsey, Hennepin, Wright, Pine, Kanabec, Anoka, Chisago, Isanti, and Sherburne constitute the fourth congressional district.
5. The counties of Mille Lacs, Benton, Morrison, Stearns, Pope, Douglas, Stevens, Big Stone, Traverse, Grant, Todd, Crow Wing, Aitkin, Carlton, Wadena, Otter Tail, Wilkin, Cass, Becker, Clay, Polk, Beltrami, Marshall, Kittson, Itasca, St. Louis, Lake, and Cook constitute the fifth congressional district.

In March, United States Senator Windom, having been made Secretary of the Treasury in President Garfield's Cabinet, resigned, and the Governor appointed Alonzo J. Edgerton to fill the vacancy until the meeting of the Legislature. After President Garfield's death Mr. Windom resigned his position as Secretary, and on the 25th of October he was again elected United States Senator by the Legislature.

The product of lumber for the year on the upper Mississippi was 339,162,197 feet; also 128,432,250 shingles, and 70,380,750 laths.

The estimated amount of merchantable pine standing May 31, 1880, according to the returns of the census, was as follows:

WHITE PINE (*Pinus strobus*).

STANDING PINE.

	No. of feet (board-measure).
Rainy Lake and Rainy Lake River.....	800,000,000
Shore of Lake Superior.....	600,000,000
St. Louis River and tributaries.....	1,500,000,000
Mississippi River and tributaries.....	2,900,000,000
Red Lake River and other tributaries of the Red River.....	600,000,000
Total.....	6,100,000,000

Cut for the census year, ending May 31, 1880
(including 187,886,000 shingles, and 88,088,000
laths)..... 540,997,000

The pine-forest gradually changes in character and decreases in productiveness as it reaches northward. Lakes, and tamarack and cedar (*Thuja occidentalis*) swamps, are common, and cover large areas; the pine-trees are

small and scattered, furnishing lumber of an inferior quality.

In the belt of hard-wood extending west and south of the pine region, and consisting of white, red, and burr oak, sugar-maple, poplar, etc., it is estimated that 3,840,000 acres of forest remain, capable of yielding an average of fifteen cords of wood to the acre, or 57,600,000 cords.

The cut for the census year ending May 31, 1880 (exclusive of 7,825,000 staves and 547,000 sets headings), was 36,884,000 feet.

The birch-lands are interspersed with tamarack swamps, and, besides the prevailing birch (*Betula papyracea*) and scrub pine (*Pinus Banksiana*), contain patches of white pine covering, in the aggregate, probably one tenth of their area.

There are 3,100 miles of railroad in the State. The State Reform School had 166 inmates during the year. The following is a summary of the condition of the banks of the State for the year 1881, as compared with the previous year :

No.	BANKS.	1881.	1880.	Increase.
SURPLUS FUND.				
27	National banks.....	\$981,725 88	\$937,003 67	\$44,722 21
9	State banks.....	104,421 84	69,931 89	34,489 95

THE AGRICULTURAL PRODUCTS OF 1881.

Cultivated hay, tons.....	175,595
Wild hay, tons.....	1,263,472
Butter, pounds.....	15,698,283
Cheese, pounds.....	417,994
Honey, pounds.....	221,255
Maple-sugar, pounds.....	49,577
Maple-sirup, gallons.....	18,418
Apples, bushels.....	147,893
Grapes, pounds.....	141,731
Tobacco, pounds.....	45,437
Wool, pounds.....	923,170

The greatest wheat-producing counties in 1880 were as follows, only those producing more than 1,000,000 bushels being given :

COUNTIES.	Acres.	Bushels.	Average yield.
Blue Earth.....	98,623	1,258,076	13.43
Dakota.....	115,197	1,489,469	12.49
Fillmore.....	138,844	1,079,551	7.75
Freeborn.....	111,461	1,444,527	12.96
Goodhue.....	191,373	2,740,962	14.32
Olmsted.....	134,923	1,167,531	9.65
Otter Tail.....	67,577	1,200,117	17.65
Polk.....	63,135	1,085,428	16.40
Rice.....	74,084	1,130,256	15.25
Stearns.....	75,453	1,111,650	14.73
Wabasha.....	101,497	1,159,935	11.42
Waseca.....	70,798	1,023,073	14.45
Winona.....	100,682	1,096,017	10.89

The following counties show a slight decrease in wheat-acreage for 1881: Blue Earth, Brown, Cottonwood, Dakota, Dodge, Faribault, Fillmore, Freeborn, Houston, Jackson, Martin, Mower, Murray, Nobles, Olmsted, Redwood, Rock, Steele, Wabasha, Waseca, Washington, Watonwan, and Winona.

The acreage devoted to flaxseed in 1881 is more than double that of the previous year, and the yield per acre—nearly ten bushels of seed—is greater than it has been for many years previous. The prominent flaxseed-raising counties are as follows:

COUNTIES.	Acres.	Bushels.
Cottonwood.....	7,503	62,903
Jackson.....	3,575	34,352
Murray.....	2,613	23,192
Nobles.....	8,857	80,543
Rock.....	8,924	44,497
Watonwan.....	8,950	50,500

Following are the statistics of forest-trees, planted and growing:

YEARS.	No. of acres planted in the season.	No. of acres growing.	Rods planted and growing on highways and farms.
1878.....	4,863	13,029	239,265
1879.....	3,220	21,249	280,945
1880.....	4,052	25,331	329,309
1881.....	3,656	23,159	258,447

COWS AND DAIRY PRODUCTS IN 1880.

Number of milch-cows.....	228,955
Pounds of butter produced.....	15,693,283
Pounds of cheese produced.....	417,394
Number of milch-cows, 1881.....	222,062
Number of cheese-factories, 1881.....	31

SHEEP AND WOOL IN 1881.

Number of sheep.....	215,453
Wool produced, pounds.....	925,170

The wheat-crop of 1881 was about 34,000,000 bushels.

The following statistics of Sunday-schools were reported to the State Sabbath-School Convention:

YEARS.	Total number of counties.	Total schools in the State.	Scholars.	Money expended in Sunday-schools.
Report of 1880....	74	1,187	64,931	\$22,760
Report of 1879....	64	794	41,367	12,416
Increase.....	10	393	23,564	\$10,344

The census of 1880 furnishes the following figures:

Whites, native to the State.....	299,530
Colored, native to the State.....	2,541
Whites, natives of other States and Territories.....	212,084
Colored, natives of other States and Territories.....	1,153
Total native population.....	613,097
Total foreign population.....	267,676
Total population.....	750,773

Of the foreign-born population, the Scandinavian countries contribute the greatest number, showing a total of 107,770: Norway, 62,521; Sweden, 39,176; Denmark, 6,071. The next largest portion is from German Europe, whence come 78,460 souls. From the Canadian provinces there are 29,789; Ireland sends 25,942; Great Britain, 12,609; Bohemia, Hungary, and Poland, 10,333; France, Spain, and Portugal, 1,888; China, 32; Japan, 1; South Africa and Australia, 63; Asia and East India Islands, 82; South and Central America, 45; and from the islands of the Atlantic Ocean, 46.

The Republican State Convention, consisting of 308 delegates, met in St. Paul on the 28th of September. The following ticket was nominated: For Governor, Lucius F. Hubbard; Lieutenant-Governor, Charles A. Gilman; State Auditor, W. W. Braden; Secretary of State, Frederick von Baumbach; Treasurer of State, Charles Kittelson; Attorney-General, W. J. Hahn; Clerk of Supreme Court, Samuel H. Nichols; Railroad Commissioner, James H. Baker; Supreme Judges, William Mitchell, D. A. Dickinson, and Charles E. Vanderburg.

The platform adopted is as follows:

The Republicans of Minnesota, in convention assembled, declare the following as the principles on which the Republican party has hitherto conducted the government wisely and economically, and which will continue to distinguish its policy:

1. The true interests of the people demand the maintenance of the broad constitutional distinction between the duties of the Executive to nominate to official position, uncontrolled by senatorial dictation, and the exercise by the Senate of the right to confirm or reject all appointments uninfluenced by Executive interference; the continuance of the policy of a metallic currency, based on the standard of the gold dollar; the fostering and encouragement of the commerce and manufactures of the country by such incidental protection as a necessary and discriminating tariff will afford; the just protection of the agricultural interests by such national legislation as will reduce to the minimum the cost of transportation of the products of the farm to the markets of the world; the continuance of the high standard of national credit which we as a nation enjoy, by the preservation untarnished of the public faith, and the prompt payment of all honest obligations; the enactment and rigid enforcement of laws prohibiting the imposition of assessments upon clerks and employes of the Government for the purpose of defraying election expenses, and the establishment of a permanent system of examination which shall secure the highest efficiency in the public service.

2. That the continuance of a free government under republican forms is dependent upon the preservation of the fullest and most perfect right to the untrammelled and independent exercise by every elector of the right to express his opinions upon men and measures, by means of a free and secret ballot, and to that end we denounce, as a blow aimed at the permanency of free institutions, every attempt, whether by force, intimidation, or fraud, to control, coerce, or defeat the independent action of the electors at any election, whether State or national.

3. That, recognizing the high importance of pre-

serving the purity, independence, and integrity of the judiciary, we deem it a sentiment in which all men must agree, that it should at all times be the aim and desire of every good citizen to elevate it as far as possible above the domain of party politics, and that eminent learning, purity of public and private character, and fearlessness in the discharge of duty, should be the only passports to a seat upon the judicial bench.

4. That the Republicans of Minnesota behold with natural pride the eminently wise and successful administration of the national Treasury by a citizen of our own State, and most heartily commend and indorse the brilliant financial policy which has distinguished that department since the accession of the present Secretary, as well as the uniform financial policy of the national Republican party, which, having had a continuous control of the national finances during a war unprecedented for the magnitude of the forces brought into the field, and the enormous expenditure incident thereto, and from its termination to the present hour, and by the rapid reduction of taxation and diminution of the national debt, has so demonstrated its marked ability to administer the government in both peace and war, that it has continued to command and deserve the suffrages of the people of this country to a degree for which there are few, if any, precedents in the history of political parties.

5. The watchfulness with which the interests of our frontier settlers have been cared for and protected; the inflexible firmness with which improvident legislation has been checked; the sound business ability which has been a conspicuous characteristic of the administration of his Excellency John S. Pillsbury command it to the hearty approval of his contemporaries, and will stand forth in the history of the State as one of the most illustrious in our annals.

6. That it is deemed eminently fitting that the first Republican Convention which has assembled since his death should express the deep sense of the public loss which is everywhere felt at the lamented demise of the late Associate Justice F. R. E. Cornell, of station so exalted, of intellect so luminous, and of public and private character so pure that it would be difficult to find his peer.

7. That, for the second time, the ruler of a free nation has been stricken down by assassination. In both cases men conspicuous for their public virtue have fallen, the first a victim of the fierce animosities of the hour; the last, let us hope, by the purposeless act of a madman. In his early death, however, President Garfield has left the nation the rich inheritance of the auspicious dawn of an administration which gave an abundant promise of the most glorious results, the firm maintenance of the constitutional prerogative of the Executive, the overthrow of a gigantic conspiracy against the public revenue. Enthroned in the innermost official circles, the inauguration of a most wise and statesmanlike financial policy, the era of good feeling, which, for the first time since the civil war, was beginning to steal across the whole land, and gave promise of the speedy burial of past sectional animosities in oblivion.

Resolved, That in Chester A. Arthur, upon whom has fallen the mantle of this illustrious man, we hope to find a successor who will in no wise disappoint the just expectations of the Republican party or of the country. Chosen by the National Convention as the associate of General Garfield on the presidential ticket, and expected by the people to be his successor in any emergency which might render such succession necessary, the Republicans of Minnesota, with due appreciation of the peculiar embarrassments surrounding his assumption of the office, and in full expectation of his faithfulness to the principles of the party, and his devotion to the best interests of the country, pledge to him their cordial, considerate, and united support.

The Democratic State Convention was held

in St. Paul on the 6th of October. The following nominations were made: For Governor, R. W. Johnson; Lieutenant-Governor, E. P. Barnum; Auditor of State, Rudolph Lehmiecke; Secretary of State, A. J. Lamberton; Treasurer of State, John F. Russell; Attorney-General, G. M. Baxter; Clerk of Supreme Court, J. J. Thornton; Railroad Commissioner, B. S. Cook.

On the subject of judicial nominations the following resolutions were adopted:

Resolved, That in the selection of judges of the highest judicial tribunal of a State, the question of personal fitness for the office rather than mere political affiliation is of paramount importance.

Resolved, That in Messrs. Mitchell, Clark, and Dickinson, present members of our Supreme Court, we recognize gentlemen eminently qualified for that important position, and we cheerfully recommend their indorsement by all who desire an able and untarnished judiciary.

Resolved, That the refusal of Judge Clark to permit his name to be mentioned for the nomination before this convention redounds to his credit, but, recognizing his superior qualifications for the office, we hereby recommend to the electors of the State the propriety of placing upon their ballots, with those of Judges Mitchell and Dickinson, the name of Greenleaf Clark.

The following is the platform adopted:

Whereas, The Democratic State Convention in 1859 embodied in its platform of principles the following, to wit:

1. That it is the duty of the people of Minnesota to preserve inviolate the faith and credit of the State.

2. That the doctrine of repudiation announced by the Republican party is one which is abhorrent to the Democracy, and must receive the condemnation of the honest masses.

3. That we pledge the Democratic party of Minnesota to honorably and promptly meet all obligations resting upon her; and

Whereas, The Republican State Convention, which lately held its session in this city, utterly ignored, in its deliberations and platform, all allusion to the proposed settlement of the State railroad bonds, a question involving vitally the honor and reputation of the State; therefore,

Resolved, That the principles of the Democratic party, as above reproduced from the platform adopted by the State Convention in 1859, are hereby affirmed, and we express the hope that the Legislature of this State, soon to assemble in special session, will, by prompt and practical legislation, solve this great problem.

Resolved, That we express our sincere grief for the untimely death of President Garfield, and our utter horror at the wicked assassination by which he was removed from life; and we hereby tender our heartfelt sympathy to his bereaved family.

Resolved, That we re-affirm the political principles announced by the Democratic National Convention which nominated Winfield S. Hancock.

The election took place in November, and the Republican ticket was elected. The vote for Governor was as follows: For Hubbard, 65,025; Johnson, 37,168; others, 3,384. For Lieutenant-Governor, Gilman received 66,677 votes, and Barnum 35,990. For the act applying the internal improvement land fund to the payment of State bonds, 31,011 votes were cast, and against it 13,589.

Four constitutional amendments were voted on at this election. One prohibits special legislation on a variety of subjects classified in the

act, and requires the Legislature to enact general laws under which all these matters may be disposed of by the courts, or county or other municipal authorities.

Another amendment is chiefly of interest to cities. It provides that cities may levy an annual tax on all lands fronting on water-mains or pipes laid down by the city for supplying the citizens with water. Still another strikes out the constitutional limitation of the session of the Legislature to sixty days, but fixes the pay of each member at \$5 per day, his total pay not to exceed \$450 for any regular session. The maximum pay for any special session is \$200.

Perhaps the most important of the proposed amendments is that which relates to the sale of the swamp-lands. It provides that all the swamp-lands now held by the State shall be appraised and sold in the same manner as the school-lands; that the minimum price shall be the same, less one third, as provided by law for the sale and appraisal of the school-lands; that the principal of the proceeds shall be inviolate; one half to be appropriated to the common-school fund and the other half to the educational and charitable institutions of the State, in the ratio of the cost of their support. The last State Auditor's report shows that up to that time there had been granted to various railroad companies and State institu-

tions 2,641,434 acres of these swamp-lands. It is the opinion of the State Auditor that not more than 2,500,000 acres of swamp-lands remain unappropriated. Most of the unappropriated remainder will be in the region north of Lake Superior.

The amendment to section 1 of Article IX was adopted by a vote of 35,019 against 18,320. The amendment to sections 1 and 7 of Article IV (relating to pay of legislators, etc.) was rejected, 28,799 votes being cast for and 32,183 against it. The amendment to Article IV, to prohibit special legislation, was adopted by a vote of 56,491 against 8,369. The amendment of section 2 of Article VIII was adopted by a vote of 51,903 against 8,440.

On the 1st of March, during the session of the Legislature, the Capitol was discovered to be on fire. The members escaped, and the most valuable archives were saved, but the building was destroyed. A new Capitol has been commenced. On the 15th of July the town of New Ulm was visited by a very destructive cyclone, which leveled many buildings, and killed and injured a considerable number of persons. The property destroyed amounted to not less than \$300,000. Much damage was also done in the surrounding country.

The following table gives the population of the State by counties, in 1880, as compared with 1870:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.

MISSISSIPPI. The yield of the crops for the past two years has not been satisfactory,

* Formed in 1875, from part of Lake; unorganized.

† Formed in 1871, from part of Redwood.

‡ Formed in 1873, from part of Lyon.

§ Formed in 1871, from part of Redwood; in 1873, part to Lincoln.

|| Formed in 1879, from part of Kittson.

¶ Organized in 1879.

** In 1870 returned as having no population; organized in 1873.

†† In 1870 detached from Chippewa and part of Lac-qui-parle attached; organized in 1871.

‡‡ Formed in 1872, from part of Redwood.

but the prices obtained for the chief staple have, in most instances, brought to the farmer a fair return. Complaint is made of the inadequate and unequal assessment of property throughout the State. It is believed that if the property of the State were assessed as required by the Constitution and laws, taxation might be reduced to less than half the present rate.

The Auditor's reports show the valuation of property in the State for the last two years to have been as follows:

For 1880, realty.....	\$79,712,851	{	State tax..	\$345,391 95
" 1880, personalty.....	85,417,800	{		
" 1881, realty.....	79,712,851	{	State tax..	345,369 42
" 1881, personalty.....	86,576,959	{		

The following synopsis from the books of the Treasurer will give the general condition of the finances of the State at the close of the fiscal year, December 31, 1881:

RECEIPTS FOR 1880.	
On warrants.....	\$976,578 63
On bonds issued.....	115,000 00
Total receipts.....	\$1,091,578 63

DISBURSEMENTS.	
Warrants paid and canceled.....	\$893,393 88
Bonds paid and canceled.....	152,150 00
Coupons paid and canceled.....	51,646 00
Total disbursements.....	\$1,097,189 88
Warrants outstanding December 31, 1880.....	296,620 95

RECEIPTS FOR 1881.	
On warrants.....	\$522,925 04
On 4 per cent bonds issued.....	75,000 00
Total receipts.....	\$597,925 14

DISBURSEMENTS.	
Warrants paid and canceled.....	\$697,915 14
Bonds paid and canceled.....	150,250 00
Total disbursements.....	\$848,165 14
Warrants outstanding December 31, 1881.....	213,540 39

INDEBTEDNESS OF THE STATE.	
Due Chickasaw school fund.....	\$315,229 11
Due interest on same.....	11,730 16
Due common-school fund.....	817,646 46
Warrants outstanding.....	213,840 39
Certificates of indebtedness outstanding.....	2,665 00
Swamp-land fund.....	50,453 03
Bonds due January 1, 1882.....	125,000 00
Bonds due January 1, 1883.....	100,000 00
Bonds (5 per cent interest) due January 1, 1896.....	227,150 00
Bonds (4 per cent interest) due January 1, 1890.....	190,000 00
Interest on bonds.....	51,364 82
Railroad-tax, distributive.....	17,113 82
Common-school fund, distributive.....	50,351 03
Interest on insurance deposits, \$6,718.61, and past-due bonds, \$350.....	7,268 61
Total indebtedness.....	\$2,685,866 93

To arrive at the actual amount of debt the State now owes and is required to pay, the following amounts must be deducted from the above:

Chickasaw school fund, upon which the State is to pay the interest only.....	\$315,229 11
Common-school fund.....	817,646 46
Warrants in the Treasury owned by the State, and included in outstanding warrants.....	185,269 97
Cash balance in Treasury December 31, 1881..	545,106 23
Total.....	\$2,863,251 82

The actual indebtedness of the State, above the amount of cash in the Treasury, is, therefore, \$322,615.11, which shows a decrease of the debt during the last two years of about \$57,000.

During the last two years the Commissioner of Swamp-Lands has issued patents for about 225,000 acres of land, for which about \$43,000 have been paid into the Treasury. Of the swamp-lands patented to the State prior to 1878, very little now remains unsold.

Under an act of the Legislature approved February 21, 1880, the Governor directed John M. Smylie to proceed to Washington and present to the Department of the Interior the claim of the State for lands and indemnity, of

which it was believed there were about 387,000 acres to which the State was entitled. Patents had been received at the close of the year for about 177,000 acres, and the remainder will be patented as rapidly as the circumstances will permit. The claim of the State to indemnity amounting to about \$50,000 is admitted by the department at Washington, but the regulations of the department render the claim nugatory unless Congress shall, by enactment, enforce compliance with the law of 1857 on this subject.

In addition to the indemnity due for lands already selected, the State is entitled to lands, indemnity, and scrip, under the act of Congress of September 28, 1850, on account of lands which have not been selected, but to which the State is clearly entitled under the provisions of said act.

There are remaining for sale by the Secretary of State, at six dollars per acre, about 34,000 acres of the Chickasaw school-lands. This is a remnant of about 800,000 acres, and is of little value. The Governor recommends that the price be reduced, and that it be transferred from the office of the Secretary of State to the Commissioner of Swamp-Lands.

For many years the State has given little attention to the school-lands, known as the sixteenth section. Many of these lands are valuable, and, in many instances in which the Government had disposed of the sixteenth section, the State has failed to make selections in lieu thereof, as authorized by the act of Congress. The Governor recommends that these lands also be transferred to the Commissioner of Swamp-Lands.

The United States owes the State five per cent on all sales of Government land situated therein. The Comptroller of the Treasury has failed to make settlement since 1879. From the large sales of lands during the last two years, the amount now due the State must be considerable.

The following educational statistics are from the report of the State Superintendent of Public Instruction, for the year ending December 31, 1880:

NUMBER OF EDUCABLE CHILDREN IN THE STATE.	
White.....	173,251
Colored.....	251,438
NUMBER IN PUBLIC SCHOOLS DURING THE YEAR.	
White.....	112,994
Colored.....	123,710
AVERAGE DAILY ATTENDANCE.	
White.....	72,681
Colored.....	88,580
NUMBER OF TEACHERS EMPLOYED.	
White.....	3,255
Colored.....	2,314
AVERAGE NUMBER OF DAYS TAUGHT.	
In country.....	74½
In cities.....	177
Average monthly salary paid teachers.....	\$30 05
Amount distributed by State.....	\$241,793 75
Amount derived from county tax.....	\$34,769 56
Total receipts.....	739,026 34
Total disbursements.....	580,704 79
Expenditure per capita of children.....	1 66
Expenditure per capita of children enrolled.....	2 70
Expenditure per capita of children in attendance.....	4 01

A comparison of the foregoing figures with those of the year 1879 shows a steady and healthful growth of the public-school system of the State. The number of white children in the public schools for the year in excess of that of the preceding year was 7,037; colored, 12,914. The average daily attendance shows a like increase, being 6,500 white children and 11,288 colored. The number of teachers employed was 202 over that of the preceding year, the increase being confined to the colored teachers. The number of days taught was reduced three in the country and increased in cities and towns constituting separate school districts from 130 to 177. The average salary paid teachers remains about the same. The expenditure per capita of educable children for 1879 was \$1.62; for number in average attendance, \$3.80. The excess in disbursements over receipts is explained by the fact that in many counties unexpended balances were carried over from the preceding year.

The University of Mississippi has diminished in the number of students.

During the session of 1879-'80 there were in the literary department.....	394
In the law department.....	20
During the session of 1880-'81 there were in the literary department.....	329
In the law department.....	13

During the session which commenced in October there were in attendance in the literary department only 193 students; in the law department, 10. The instructors employed are, one professor of law, ten in the department of arts, and three in the high-school. The income of the university is little above the amount needed for current expenses. It is greatly in need of a library building and books to put in it; the law department has no building; and a good refracting telescope ought to be provided for the observatory. One good building can be made to accommodate both the library and law department. The greatest need of the university, however, is good schools of a high grade in different parts of the State to prepare boys for the university, and to excite in them a desire for education. To have these schools there must be a supply of competent teachers, and to meet this demand there must be established a normal school for the special training of teachers. A normal department can be established and maintained at the university at a comparatively small expense.

The Agricultural and Mechanical College first opened its doors for the admission of students on the 6th of October, 1880. During the first month 200 students matriculated, and the number soon increased to 300. The dormitory was not completed until some time in the spring of 1881. There were during the first year 354 matriculations, and the average attendance was over 200. There were in attendance at the close of the year 267 students, about as many as could be comfortably provided for. The faculty consists of a president, six professors, four tutors, and one United States offi-

cer furnished by the Government for military instruction. At least one additional professor is now required.

Alcorn Agricultural and Mechanical College is as prosperous as the impoverished condition of the colored people of the State will warrant. There were in attendance during the last college year 160 students. An appropriation of \$12,000, to properly equip the agricultural department of this college, is required. The State Normal School is doing much good in educating the colored youth of both sexes.

The educational institutions of the State are almost exclusively for the instruction of young men. No facilities have been provided by the State for the instruction of females in the higher branches of learning.

The number of patients under treatment in the Lunatic Asylum, during the year 1880, was 535. Of this number 44 died, 43 recovered, and 3 improved. There remained in the Asylum at the end of the year 442. In 1881 there were under treatment 547 patients, of whom 60 died, 53 recovered, and 5 improved. There were remaining in the institution on the 25th of December, 1881, 416 patients. The large increase of mortality during the year 1881 was mainly among patients who had long been suffering with chronic affections, such as heart-disease, consumption, and other kindred diseases.

The number of pupils now in the Institution for the Deaf and Dumb is larger than ever before. The average attendance for the years 1880 and 1881 was 42. There are now in the institution 68, 14 of whom are colored.

On the 1st day of December, 1881, there were in charge of the lessees of the Penitentiary 876 convicts, of which 782 were colored, 92 white, and 2 Indians. During the last two years commencing December 1, 1879, and ending December 1, 1881, 125 have died, 136 have escaped, and 25 recaptured. The number of convicts received in 1880 was 280; in 1881, 351. The number discharged in 1880 was 228; in 1881, 188. The number pardoned in 1880 was 34; in 1881, 41.

The amount of hire for convicts, from June 15, 1876, to January, 1881, is \$40,231.19; amount of improvements contracted for during the time, \$31,774.04; all of which were completed with the exception of \$3,896.65. Since that time work on said contract has been done to the amount of \$2,070, leaving yet to be completed improvements amounting to \$1,826.65. Permanent improvements amounting to \$4,749.17 were also made by the former lessees prior to the expiration of the lease, January 1, 1881.

Under act of March 6, 1880, the Board of Public Works leased the Penitentiary and all property pertaining thereto, for six years from January 1, 1881, for \$39,420 per annum.

The following figures are taken from the report of the State Commissioner of Immigration and Agriculture.

The area of Mississippi is 47,156 square miles, or 30,179,840 acres, divided into farms as follows:

YEAR.	Number of farms.	Number of acres.	In cultivation.
1860.....	42,840	15,840,000	5,065,000
1870.....	68,023	13,129,000	4,209,000
1880.....	75,205	13,513,000	4,895,000

It will be seen from the above table that, in 1860, 5,065,000 acres of land were under cultivation, and, in 1880, 4,895,000 acres, or nearly as much as in 1860, which shows that the farmers of the State are gradually recovering from the disasters of the war.

AGRICULTURAL PRODUCTS OF MISSISSIPPI.

UNITED STATES CENSUS	1870.	1880.
Value of live-stock of all kinds.....	\$29,910,000	\$35,792,000
Corn, bushels.....	15,658,000	21,875,000
Oats, bushels.....	414,000	1,959,620
Cotton, bales.....	564,000	955,808

Mississippi still keeps the first place in cotton production, having made in 1879-'80 955,808 bales, while the second place is given to Texas with her 808,000 bales, or a difference in favor of Mississippi of 147,800 bales. Of this immense cotton crop the white people made 323,-

600 bales, or a little more than one third of the total crop.

MANUFACTURES IN MISSISSIPPI.

	1870.	1880.
Manufactories.....	1,731	2,331
Hands employed.....	5,941	7,545
Capital invested.....	\$4,501,714	\$6,725,520
Wages paid.....	4,547,428	6,274,630
Value of productions.....	8,154,753	12,352,375

The principal articles manufactured are lumber, cotton and woolen goods, cotton yarns, cotton-seed oil, agricultural implements, wagons, bricks, and machinery. The facilities for water and steam power in the various parts of the State are great, and are advantageously distributed.

The census taken in 1880 by the State authorities, as a basis for the legislative apportionment, makes the total population of the State 1,143,713, of whom 481,728 are whites, and 655,554 blacks; and 110,113 are white voters, and 130,607 black voters. The number of children of school age is 185,026 white, and 259,105 black; and the number of public schools is 5,024.

The population of the State by counties, as returned by the census of 1880, and as compared with 1870, is as follows:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.
Adams.....	22,649	19,084	Itawamba.....	10,663	7,812	Pike.....	16,688	11,303

A State Prohibition Convention was held in Jackson, on the 20th of July, forty-two coun-

ties being represented by 282 delegates. No candidates were nominated, but an address was adopted, and the following resolutions:

* Organized, in 1870, from parts of Marshall and Tippah.
† Organized as Colfax in 1872 (name changed in 1876) from parts of Chickasaw, Lowndes, Monroe, and Oktibbeha.

‡ In 1871, from parts of Carroll and Sunflower.
§ Formed and organized, in 1871, from parts of Carroll and Choctaw; in 1874, part to Sumner.

|| In 1877, from parts of Coahoma, Panola, Tallahatchie, and Tunica.

¶ In 1876, from parts of Issaquena, Warren, and Washington.

** Organized, in 1874, from parts of Chickasaw, Choctaw, Montgomery, and Oktibbeha.

†† Organized, in 1873, from parts of De Soto, Marshall, and Tunica.

‡‡ Formed and organized, in 1870, from parts of Tippah and Pontotoc, and, in 1874, part from Lee.

Resolved, That the president of this convention appoint an Executive Committee of fifteen, two from each congressional district and three from the State at large, five of whom shall constitute a quorum, and whose duty it shall be—

1. To prepare and submit to the Legislature at its next session a memorial setting forth the evils of the liquor-traffic in this State, and, in the name of this convention, praying and demanding that an amendment to the Constitution prohibiting said traffic in this State shall be passed and submitted to the people for ratification or rejection at the next succeeding general election.

2. To facilitate and further the organization of prohibition clubs in every county and town throughout the State, and disseminate accurate and reliable information among the people as to the evils of the liquor-traffic.

3. To render such service as may be deemed proper in the preparation of the constitutional amendment above referred to, and such as any committee of the Legislature charged with the special duty may request.

4. To call any conventions, State and county, which may hereafter become necessary, either for the purpose of promoting the ratification of such an amendment to the Constitution as the Legislature may adopt, or for the more efficient organization of the friends of prohibition throughout the State, should the Legislature fail or refuse to pass the amendment desired, in order to secure all needful legislation, and protect the health, lives, and property of the people against the evils of the whisky-traffic.

Resolved, That any vacancy in said committee may be filled by the president of this convention, or by any three members of the committee; and that the committee constituted under these resolutions shall hold office until superseded by some future Prohibition Convention.

Resolved, That the people of the several counties and towns in this State be and they are hereby urged at once to organize prohibition clubs, and appoint county executive committees, and prepare, by suitable subscriptions and contributions of money, for the circulation of petitions for prohibition, after such form as the executive committee may adopt, and the presentation thereof for signature to every man and woman in the State, to the end that there may be a full and fair expression of public sentiment on this measure for the information and guidance of the Legislature; and that the several county executive committees when organized shall correspond with and be subject to the direction of the State Executive Committee.

Resolved, That pending the submission of the said contemplated constitutional amendment, the Legislature be requested to provide by law for the determination of the question of licensing liquor-dealers, by a direct vote of the people within the towns, counties, and supervisors' districts in this State, within which liquor is sought to be sold, for annulling the existing license laws; and if the people agree to license dealers, for limiting the quantity for sale to not less than one gallon, while the price of the license is largely increased; and that the Executive Committee be charged with the duty of bringing this matter to the early attention of the Legislature.

The Democratic State Convention met in Jackson, on the 3d of August, every county being represented and 521 delegates being present, and was in session four days. The following ticket was nominated: for Governor, Robert Lowry, of Rankin County; for Lieutenant-Governor, G. D. Shands, of Tate; for Secretary of State, Henry C. Myers, of Marshall; for State Treasurer, W. L. Hemingway, of Carroll; for Auditor of Public Accounts, Sylvester Gwin, of Lawrence; for Attorney-General, T. C. Catelings, of Warren; for State Superintendent of Public Education, James A. Smith, of Jasper. The platform adopted was as follows:

1. *Resolved*, That we re-affirm the following principles, adopted by the Democratic State Convention which assembled in this city on the 2d day of August, 1877:

The Democratic party of Mississippi, grateful for the success of its past efforts in the cause of reform and of just and honest government, and invoking the blessings of Heaven on its future endeavors in the same cause, does adopt and proclaim the following platform of principles:

MISSISSIPPI RIVER IMPROVEMENT.

Fidelity to the Constitution of the United States.

Home rule, and the preservation of the State governments, with all their reserved and guaranteed rights unimpaired.

No interference by the military power with the freedom of elections, and with the civil and political rights of citizens of the United States.

The protection of the equal rights of all classes.

No discrimination on account of race, color, or previous condition of servitude, or birthplace, and no special legislation for the benefit of the few at the expense of the many.

A strict adherence, in the selection of public agents, to the time-honored Jeffersonian standard, "Is he honest, is he capable, is he true to the Constitution?"

A continuation of the policy of retrenchment and reform so signally inaugurated by the Democratic party.

Reduction of the burdens of taxation to the lowest point compatible with an efficient execution of the laws.

Corporations of every description supervisable within constitutional limits by State authority, and subordinate to State legislation, in the interest and for the protection of the people.

As the perpetuity of free government depends upon the virtue and intelligence of the people, we pledge ourselves to the maintenance of our State system of free schools.

We favor the granting of such aid as may be extended without violation of the Constitution of the United States, or departing from the established usages of the Government, to the Texas Pacific Railroad, and for the rebuilding and keeping in repair of the levees of the Mississippi River.

That upon this platform of principles and of public policy we invite the co-operation of all citizens without regard to past differences, in support of the candidates nominated by this convention.

2. *Resolved*, That we declare it to be the policy of the Democratic-Conservative party to encourage the flow of immigration to this State, and recommend the passage of all needful laws and the making of all necessary appropriations to effect this end.

3. *Resolved*, That we invite the investment of capital, and assure to it all necessary legal protection.

The Greenback-Republican State Conventions agreed upon the following fusion ticket: Benjamin King, for Governor; J. B. Yellowley, for Lieutenant-Governor; J. J. Spelman, for Secretary of State; J. M. Bynum, for State Treasurer; A. T. Wimberly, for Auditor of Public Accounts; W. F. Fitzgerald, for Attorney-General; W. D. Howze, for Superintendent of Public Education.

At the election in November the Democratic ticket was elected. The vote for Governor was: Lowry, 76,857; King, 51,856. The Legislature elected at this election is composed as follows:

PARTIES	Senate.		House.
Democrats	83	102	
Republicans	8	15	
Independent Democrats	1	8	
Greenbackers	2	
Total	87	122	

MISSISSIPPI RIVER IMPROVEMENT.

The first appropriation made by the United States Government for the benefit of its great "Inland Sea" was in 1819, when \$6,500 were voted for its survey. In 1820 an additional sum of \$20,000 was set apart for this purpose. A general system of river improvement was begun

in 1824. In that year the Ohio received \$75,000, and \$50,000 more was bestowed on that tributary in 1827, 1829, and 1830. In 1829 a survey of the mouth of the Mississippi was ordered. The Treasury has bled freely in favor of insignificant streams belonging to some well-represented locality; but the Mississippi, which belongs to no State and no section, sweeping through the length and breadth of the land from its northern to its southern limit, has found no advocate zealous enough to procure a due proportion of governmental aid. It has not received one-sixth of the general appropriation. Broken banks and shifting shoals have been suffered to impede its navigation. Napoleon, when he sold its delta, announced to the French nation that he had thus given to England a maritime rival who would yet make her tremble for her supremacy on the seas. A wise statesmanship would have made it a paramount object to keep the great river free from all impediments; even a certain justice would suggest that the Government, which levies a revenue of \$1,200,000 by licenses of pilots, steamboats, and other riparian taxes, should employ a part of these charges on the commerce of the river in its improvement. The estimate of the commission for requisite works was \$4,123,000. Much opposition was made to the bill, but finally \$1,000,000 was secured by the act approved March 3, 1881.

The law under which the commission was organized requires it to complete the surveys now in progress between the head-waters of the river and the head of the passes near its mouth, and to make such additional surveys and investigations, topographical, hydrographical, and hydrometrical, of the river and its tributaries, as it may deem necessary.

The first report of the commission (see "Annual Cyclopædia," 1880) describes the work done to January 8, 1881. Between that period and October 10, 1881—

... The triangulation of the river has been completed from Arkansas City, Arkansas, to Greenville, Mississippi, thirty-eight miles distant, where it joins the Coast Survey triangulation, now complete from that point to the Gulf of Mexico. It has been completed between Thebes, Missouri, and Cairo, a distance of twenty-two miles, and between Grafton, Illinois, and Keokuk, Iowa, a distance of one hundred and sixty-six miles; this latter chain depending on bases measured with a secondary base apparatus at Grafton, Louisiana, and Keokuk. Azimuth determinations were also made at these last points. The triangulation is accordingly now completed from Keokuk, Iowa, to the Gulf of Mexico.

The precise levels have closed a gap of six miles above Greenville, Mississippi. They have been completed from Neeley's Landing, Missouri, to Cairo, a distance of one hundred and fifty miles.

The Coast and Geodetic Survey has made its line of precise levels continuous from Greenville to New Orleans, so that the precise levels are now complete between Keokuk, Iowa, and New Orleans.

A tide-gauge has been established in the Gulf of Mexico at Biloxi, and the Superintendent of the Coast and Geodetic Survey has kindly offered to connect his line of precise levels along the Mississippi River with this tide-gauge, so that within a year or two it is hoped to refer with precision all the levels

along the Mississippi River to the mean level of the Gulf of Mexico as an origin.

The preliminary topography and the soundings have been carried from Walnut Bend, Arkansas, to Sunflower Landing, Mississippi, a distance of seventy miles, and a survey of Vicksburg Harbor has been completed.

The plotting of the topography and hydrography has been continued, twenty-six additional sheets having been plotted to a scale of $\frac{1}{50,000}$.

The preparation of a preliminary chart of the river on a scale of $\frac{1}{50,000}$, or one inch to a mile, has been begun, and four sheets, reaching from Cairo to Cottonwood Point, are completed.

The observation parties which were placed on the upper Mississippi last fall at Prescott, Winona, Clayton, Hannibal, Grafton, and St. Louis, have been maintained during the year, and were withdrawn about October 25th. Aside from information gained as to changes in the bed of the river, and as to sediment, these observations will give at short intervals during the year the discharge at the respective stations, and also the annual discharge.

A party which, at the date of the last report, was engaged in determining the heights of high-water marks for the flood of 1880, has completed that work from Cairo to Fort Saint Philip, below New Orleans, and has determined the slopes of the river at low water from Cairo to Commerce, Mississippi, a distance of three hundred miles.

In order to obtain more definite information as to the height of the alluvial bottom-lands of the Mississippi and their reservoir capacity, a series of transverse level lines, running from ground above overflow on the east side of the river to the similar ground on the west side, has been undertaken. High water on the bottom-lands interfered seriously with the progress of this and of other work on the lower river during last spring. . . . With the remainder of the present appropriation, it is hoped, during the coming year, to complete the final topography and hydrography from St. Louis Landing to Vicksburg, to complete the lines (nine in all) of levels across the alluvial bottom of the Mississippi River, and to keep gauging parties at Paducah and Columbus, Kentucky; Helena, Arkansas; Lake Providence, Louisiana; and the mouth of the Red River, until next fall.

After the adjournment of the last Congress, the commission met to determine the best mode of expenditure for the \$1,000,000 appropriation. Out of the six reaches of difficult navigation, they selected two, Plum Point and Lake Providence reaches.

Plum Point reach includes thirty-eight miles of shifting shoals between wide banks, with a minimum depth of four and a half feet. It lies between Cairo and Memphis, and extends from Island No. 26 to Randolph, or Second Chickasaw Bluffs. The banks vary from 2,000 to 10,000 feet in width. Lake Providence reach extends from Skipwith's Landing, Louisiana, to the foot of Island No. 95, a distance of twenty-five miles. These are the lowest of the shoals which seriously interfere with commerce. The cotton-boats which ply in the bends between White River and New Orleans could during low water extend their trade two hundred miles were the bars near Lake Providence removed. The plans of the commission were duly sanctioned, but the preparation of the "plant" delayed the work. They had in possession only the moderate outfit necessary for surveying, and the equipment had to be made, not enlarged. Owing to the overcrowded condition

of machine-shops and ship-yards, this could only be slowly obtained. The revetments for bank protection and the permeable dikes have therefore not been completed. Nor can their adequacy be estimated until one high-water stage has tested their resisting power, and one low-water stage has shown their actual effect upon the shoals. The detail is experimental, but of the practicability of the general plan for deepening the channel of the river below Cairo to the full extent of the demands of commerce, the commission do not entertain a doubt. They thus briefly sum up their views:

The improvement is to be secured by narrowing the low-river channel-way to an approximately uniform width of three thousand feet in localities where the widths are excessive and the navigation bad, to be accomplished and rendered permanent through the agency of such works as will also create comparative uniformity in the width of the high-water channel. For the attainment of this result, two distinct classes of works, differing widely in character and purpose, will be required, viz., revetments for the protection of caving banks, and dikes or other structures for the contraction of the channel-way. The bank revetments are intended not only to stop the constant and, in some localities, very rapid enlargement produced by erosion and caving of concave bends, but in addition thereto to check the growth of bars and shoals below by accretions supplied directly therefrom. The process of laying this revetment will vary greatly in different localities, but will commonly, or at least in many cases, consist in first freeing the banks of snags, stumps, and brush, and then placing a mattress, composed of wire netting overlaid or interlaced with brush, upon that portion of the slope extending from deep water to a few feet above the water-level, and weighting it with sufficient rip-rap stone to hold it in place. The revetment is afterward completed by grading the bank above the water-level to a proper slope with streams of water under high pressure, after the manner commonly followed in hydraulic mining, and laying thereon a supplementary mattress, overlapping the one previously laid, and extending up to the crest of the bank.

More expensive additions of stone and gravel can be safely omitted for some years until the brush decays. A growth of grass and willows can be encouraged, forming the natural and best protection of such banks. Works of this general character have already been employed at points on the Missouri and Mississippi, and they have proved their permanence and utility. The other class of works for narrowing the river have also been executed on these two great rivers. Failures and disappointments are to be expected in dealing with their powerful floods and using novel expedients. These light, permeable dikes, composed of piles, poles, brush, and wire, placed either longitudinally or transversely to the channel, do arrest the velocity of the water, cause a deposit of silt, and thus build up new banks, correcting the channel and causing it to deepen itself. Solid structures do not stand in the bed of the Mississippi unless built down to so great a depth that their cost alone would preclude their use. However experimental these slighter methods may appear, impediments to the free flow of the river, sufficient to check its velocity, do cause a deposit which builds up a new bank and regulates the

channel. The absence of precedents, the new modes of construction, the possible existence of gravel-beds requiring to be dredged out, and the fact that new bars may form where navigation is now easy, render it difficult to form a close estimate of the expense. The initial works on the 184 miles of bad navigation between Cairo and Vicksburg were computed to require \$4,113,000. The additional works to complete and render permanent these improvements can not cost more than that sum, amounting in all to \$8,226,000, or \$45,000 per mile for 184 miles. "These estimates cover about one fourth of the length of the river where navigation needs improvement, viz., from Cairo to Red River; and, assuming that the remaining three fourths will cost proportionately, the aggregate cost of the entire improvement would reach \$33,000,000. These are outside figures, based on detailed estimates of the worst portion of the river." However much they may differ on minor points concerning methods of river regulation, the commission record their unanimous opinion that they can thus maintain a continuous low-river channel showing a minimum depth of ten feet on all bars and shoals between Cairo and the head of the passes, while there is a strong probability of deepening it much beyond that mark. They are, therefore, "prepared to recommend the application of the methods and details heretofore described, to the lower river, from Commerce, Missouri, downward, with such continuity as will not only improve the immediate localities where navigation is now bad, but will also establish and retain such control over the high-water discharge as will arrest that tendency toward deterioration which has rendered the systematic improvement of the entire river necessary. While this order of progress is proper for works designed to amend and regulate the existing channel, those undertaken for the purpose of retaining or increasing the volume of discharge within the bed, such as levees and dams for closing outlets, should begin below and be carried continuously upstream."

The commission repeat (see "Annual Cyclopaedia," 1880) their opinion of the utility of levees as a means "to prevent destructive floods," which, by confining the flood-waters of the river within limits, tend to increase the scouring and deepening power of the current. Their researches into the early condition of the banks of the Mississippi bring only meager information. The discoverers and adventurers did not direct their observations in scientific directions. They report that its immediate banks were densely clothed with forests and cane (*Arundo gigantea*). Cane will not grow on land subject to inundation, therefore it marks the precise limits of habitual overflow. A canebrake is, perhaps, the best possible device to check water encroachment, by causing a sedimentary deposit and consequent elevation of the bank. Darby (1817) states, in his "Statistics of Louisiana":

In common years the rise begins about the 1st of March and increases rapidly until the river's bed, glutted, throws the superfluous water through innumerable channels into the back reservoirs. The increase of elevation is then slow, and a diurnal decrease is perceived, owing to the continually increased surface that must be overflowed. Many outlets occur, . . . but few lakes, in the true acceptance of the term, are found. The banks of the river are generally above overflow, and are composed of the most productive soil, gradually sloping back by an inclination that gives from one quarter to one and a quarter miles width before the plain sinks below the surface of high water.

Without human testimony, physical reasons compel the belief that, before the lands adjacent to the main stream and its tributaries were cleared, the elevation of the river-banks conformed more nearly to the flood-plane of the river than at present. Levees undertaken for reclamation must now maintain the former height of the banks to preserve navigation. Bank-building near the mouth of the river is, at this moment, progressing under the same conditions, and each *crevasse* demonstrates this truth. At Bonnet Carré the deposit, extending back to Lake Pontchartrain, four or five miles distant, is ten to twelve feet high. Through these sand-hillocks outlets—probably drainage canals of the old plantations—keep themselves open. The banks of cut-off lakes add their conclusive evidence. In front of Lake Concordia the main height of the bank of the present river is one hundred and forty-eight feet, while the height of the bank of the old river is one hundred and fifty-three feet. In estimating this difference a uniform average flood-height is supposed, and there is no proof to the contrary. G. W. R. Bayley, before the American Society of Civil Engineers, says: "There is no evidence that the normal flood-line of the Mississippi River, from Red River to the head of the passes (except where affected by cut-off), is a fraction of an inch higher now than in 1717, before the commencement of the levee system, but there is evidence that it is not higher." Professor Forshey concurs in this opinion. General Warren sums up the discussion before that enlightened body thus: "Obviously, we can not get the increased scour until we build the levees and close the outlets, so as to confine the escaping flood-waters." High-water marks at Natchez, dating back to 1802, compiled by Humphrey and Abbot, and brought down to date by the United States Engineer Corps, strongly corroborate this view. Beginning thirty years before the extension of levees above Red River, they show no change in the flood-elevation during eighty years. The effect of closing the outlets of the Atchafalaya is similar.

The flood-plane has not been raised since the settlement of the country. The clearing of the forests has accelerated caving, and prevented the gradual elevation of the banks by arrest and deposit of sediment. Levees, averaging eight feet in height, are part of the normal bank.

These levees extend on both banks of the river for a distance of sixteen hundred miles, out of a total alluvial shore-line of about twenty-two hundred miles. They attain, occasionally, a height of from fifteen to twenty feet, exclusive of the dikes, closing well-defined outlets, when they frequently have a height of forty feet. Were these dikes removed, they would admit the main supply of the largest rivers in the valley. . . . The commission has already reported adversely to the influence of such lateral channels. Also, below many of the largest of these artificial embankments are parts of the river where navigation is now exceedingly difficult. . . . Certainly the maintenance of volume is important in preventing such obstructions. But, apart from these as extreme cases, is not the retention of such part of the flood-discharge as is now held by an average height of seven or eight feet of artificial embankment necessary to maintain the navigation of the river in its present condition? Without these, the most moderate floods would overtop the banks and disperse their waters through the innumerable lateral swamp-drains from bluff to bluff, with loss of velocity and consequent obstruction of channel. If this description of the present status of levees is true, it must be borne in mind that the causes by which it was brought about are not local, but exist in every tributary valley. The disturbance of the forest and sod-covered surface, and the undue precipitation of drainage, extend to the head-waters of the Mississippi, of the Ohio, and of the Missouri, while the remedies which have been opposed to these evils—the placing artificial barriers to such dispersion of flood-waters as would have been highly injurious to navigation, and the maintenance of these barriers—have been exclusively done by the riparian States and proprietors. While, doubtless, the motive was reclamation and self-protection, we believe that much of the benefit accrued to other sections of the country, equally interested in the navigation of the river, and equally responsible for its deterioration. Without discussing the equity of this condition of affairs, we earnestly represent that it is extremely hazardous, as a system of such character and magnitude can only be maintained by unity of administration, by promptness of action, and by large expenditures. Neither of these is, or can be, secured while the work is left under the present management. Its history sustains this statement.

The report proceeds to array the opinions of competent authorities who have studied the subject in its scientific aspects, all favoring the levee and jetty systems, and reprobatating the outlet theory. It then cites instance after instance where closing outlets and regulating banks have washed out channels and removed even such obstacles as the raft in the Atchafalaya. In the Lafourche, whose lower portion is unleveed and free to discharge itself laterally by numberless outlets, the effect has been to narrow the channel one third or fourth of that above, where it is confined. Between the levees it has not filled to any appreciable degree; the elevation takes place where the outlets occur. The obstruction there backs up the water and raises the water-line, so that year by year the height of the levees must be increased. Red River runs through an alluvial soil, like the Mississippi, and its levees have undoubtedly lowered the river-bed. The President of the New Orleans and Red River Transportation Company, to show the effect of jetties on river-bars, states that Snaggy-Point Bar, seventy-five miles above the mouth of the river, and Alexandria Bar, three miles below the town of that

name, have, in low water, proved almost impassable, having a depth of only from fifteen to twenty-four inches. This company, in 1876, placed a jetty of willow mattresses in Snaggy Bar, and in forty-eight hours the depth had increased from twenty inches to five and a half feet. In 1877, after the high water, the jetty was found intact, and, during the extremely low water of that year, there was a steep channel and not a moment's detention to navigation. The company, in the autumn of 1877, placed jetties on Alexandria Bar, where their boats, after transhipment of cargo, could not pull across. From sixteen inches, a four and a half to five feet channel was gained, although the river continued to fall during several weeks afterward. Freight charges, in consequence, were lowered one third.

Between the Red River and the Gulf of Mexico, the prairies west of the Tèche and the Mississippi, exists a net-work of rivers and bayous. Sloping both south and east, it has a double system of drainage. The more westerly of these water-courses are in a state of decadence, the more easterly are increasing. The deposits of the Red River are clearly traceable in their banks, showing that at different times that stream has poured through each of them. It seems probable that the Robert, Bœuf, and Tèche Bayous once constituted the main continuation of the Red, while the Atchafalaya was the lower trunk of the Black and Ouachita, and a clear stream. These various changes have occurred during high water, from their tendency, through the slope of the valley, to seek an easterly *débouchure*. Choked by the raft, which moves steadily up stream, from accretion at the head and decay at the foot, the Red River seeks lateral outlets. At one time the Atchafalaya, thirty miles from the Mississippi, was covered with rafts which became solid floating bridges. The State of Louisiana undertook the removal of this obstruction, and the rapid enlargement of the stream followed. The old residents testify that whereas it was shot-gun distance across, it is now fully rifle-distance. Its navigation is now good, but the fine plantations that once bordered it are wholly abandoned, and lands once above overflow are at present constantly submerged. Yet the increase of the Atchafalaya as an outlet of the Mississippi has caused no reduction of the flood elevation of that river.

The distance to the Gulf by the Atchafalaya is 160 miles and the average fall per mile is $3\frac{1}{4}$ inches, while the distance by the Mississippi is 327 miles, and the fall less than $1\frac{1}{4}$ inch per mile. The flood and low-water grades of the Red and Atchafalaya Rivers are below those of the Mississippi in the same latitude.

The commission apprehend the enlargement of the Atchafalaya, even to the point of becoming the main river. The diversion of the discharge of the Mississippi would impair the navigation below and through the jetties, jeopardizing the commerce of the valley and the in-

terests of its port, while the establishment of favorable navigation through the Atchafalaya could only belong to some distant and doubtful day. The commission, therefore, recommend the building of a continuous brush-sill across Old River, between Turnbull's Island and the Mississippi, with the object of checking the enlargement of that outlet.

Floods of an abnormal nature occurred in the Missouri during the spring of 1881. The preceding winter was unusually severe, and the river was entirely closed in November. A February thaw caused an overflow and piled up ice. When the spring rises began, these gorges broke above Sioux City, and the snow-water came sweeping down, submerging the valley for 600 miles. One flood came down on the 7th of April and another on the 22d. The river was out of its bed. It was transferred from its ordinary section to one of slight depth and great width. The slope was nearly doubled, but owing to frictional resistance the rear water piled upon that in front and produced the unusual rise of from five to eight feet.

Hence, if the flood had been restrained by levees where necessary, and, still better, if the high-water section had been reduced to any approximately uniform and suitable width, the water-surface would nowhere have surpassed, and would generally have fallen much below, the level of the present banks. . . . Any fill which took place in the bed proper during the overflow, was pretty much scoured out on the falling stage, after the river got within its banks again. From all points it was reported that during this period the force and velocity of the current were extraordinary. Bars which had been permanent fixtures for years were removed and a general deepening was noticed on all sounded sections. But on islands and bars which were sheltered from this great scour, the depth of the deposit gives sufficient evidence of the extent to which fill took place during the overflow.

Extensive changes in the channel resulted, which exercised a serious influence on the projected system of improvement.

Up to a recent date it has been supposed that the bed of the Mississippi consists of layers of tenacious blue clay belonging to the tertiary formation, so little susceptible of erosion that it is practically permanent. To determine this point, under the direction of the Engineer Department of the United States Army, and latterly of the commission, borings in eighty-three places have been made. Though these borings were not less than one hundred, and oftentimes more than two hundred feet in depth, only twenty-two pierced the alluvial deposits and reached the underlying tertiary beds. It appears, then, that the great trough in which the river runs was hollowed for a still mightier stream.

The depth of these alluvial beds averaging one hundred and thirty-one feet below high water of 1880, it follows that it can only be in exceptional cases that the river scours down to the clay, and there is space for deepening, should it ever become desirable. Nor would this underlying stratum offer insuperable diffi-

culties if erosion became necessary. In the northern portions of the valley it consists of clay and sand with beds of lignite; in the southern, of greensand, marls, and marly clay.

Below Cairo the alluvium of the Mississippi occupies a huge trough carved out of the soft eocene tertiary layers, bounded by loess-capped bluffs. Westward of this ridge, between Commerce, Missouri, and Helena, Arkansas, is another alluvial region, nearly as extensive as that of the Mississippi, whose basin, drained by insignificant streams, was probably excavated by floods caused by erosion of the present valley of the Mississippi. This alluvium consists of clays, sands, and gravel largely siliceous, the material generally growing coarser as it descends below the surface. Deeply seated extensive clay layers are rare and wanting in traces of vegetation. Remains of trees in a vertical position are sometimes seen in a cutting bank, but not lower than depressions in the bottom-lands where forests are now growing, remote from the channel. Logs in good preservation are found deeply imbedded in sand or gravel, but their position and the absence of bark show that they are drifts. Borings during 1879 revealed the general law that the nearer the Gulf the deeper the surface-silt deposits, and the greater the surface changes from fluvial forces. The clay beds are sometimes entirely wanting, and sometimes, as at the foot of cut-off bends, they may be of great thickness, the deep trough having been slowly filled with the finer silt. At Lake Providence a depth of one hundred and nine feet of fine clay and sand is separated from the lignite by a bed of unusually heavy gravel.

There is a decrease in the size of the gravel as the river is descended, especially below Lake Providence. The gravel layers are of identical material above the mouth of the Arkansas; below it, the larger pebbles are of siliceous clay, stones, and of white cherty material. Red and yellow jasper, brown-stone, chert, clay-balls, and water-worn lignite compose the gravel-beds. The sand, which is usually found between the surface clays and the gravel layers, is always siliceous, and generally water-worn. Mica and the whitish-gray sand of the northern lignitic group are lacking in the alluvial strata. Crystals of iron pyrites are sometimes found in the gravel-beds. Water from wells throughout this region is strongly impregnated with iron, and unpalatable. Water nearer the surface is preferred, being clear and agreeable; but it is saturated with vegetable impurities, and productive of malarial disorders. So far, no wells have been sunk through the alluvium into the older strata.

The bluffs on either side of the Mississippi below Cairo are composed at top of the quaternary loess, resting upon the orange sand, or bluff gravel, which in turn rests upon the tertiary layers. The thickness of the loess varies continually, depending upon the elevation of the orange sand as left by the glacial floods. The thickness of the orange-sand deposit,

even at points nearly adjacent, also varies greatly, and depends not only upon the height at which its upper surface has been left by the subsidence of the glacial flood, but also upon the height of the upper surface of the underlying tertiary formation, which had been at some point deeply furrowed by the glacial waters, whose central current plowed out the huge alluvial trough of the Mississippi.

All the borings between Cairo and the Gulf show that the alluvium rests on tertiary deposits. Back of Helena were found the first marine tertiary strata which prevail below Helena as the underlying formation. High banks, far from marking tertiary deposits, cover the deepest alluvial beds of the Mississippi bottoms. Vegetation imbedded in the clays near the surface proves that they were not built up, as is the alluvion, and afterward elevated by earthquake-action. To some water agency mightier than the modern Mississippi must this formation be attributed. Professor Potter supposes that these high prairies are the sand-bars of the glacial stream. The small size of the fossil shells indicates the periodic destruction of the salt-water tribes by northern fresh waters anterior to this glacial flood.

Southward of Gainesville there are beds of white quartzite. This extraordinary Silurian outcrop is doubtless due to the induration of the white tertiary sand, like that shown in the borings near New Madrid and Plum Point.

In these two vicinities the bed material which offered the most resistance to boring-tools is lignite. Below Memphis are beds of hard clay, popularly known as soap-stone, which were reached at ninety feet beneath the high-water mark of 1880. At Helena and Choctaw Bar there are stiff clays, probably of concretionary origin. Near Greenville, sub-alluvial layers were found at 88.4 feet, the least depth below the surface anywhere obtained. Save in one or two instances, nothing was discovered in the alluvial layers beneath the surface clays which would offer any decided resistance to erosion. There is no difficulty in working in material such as this, were it judged proper to deepen the bed of the river. In an engineering point of view this conclusion is important. It also affects the question of levees. Unnecessary heights have been proposed for them, on the assumption that there is an immovable river-bed. Their estimated cost, made on these grounds, can certainly be diminished.

The commission are not in possession of the data deemed necessary in making a trustworthy estimate of the entire cost of a levee system, but a great reduction is evidently practicable in the amount of former estimates based on the assumed existence of a river-bed not subject to erosion, and on levee-work at forty or fifty cents per cubic yard.

The discussion establishes a strong presumption that the levees of the Mississippi do not now stand as works superimposed on the normal banks to restrain additional flood-volume, but as artificial barriers to replace that natural height of bank which has been lost from causes connected with the occupation and cultivation, not only of the banks of the main stream, but also of the basins drained by the tributaries. Their present function is not so much to increase the flood-volume abnormally as to maintain that part

of it which would otherwise be lost from the degradation of the banks.

It may be said of outlets (which term we restrict to well-defined depressions connecting the river with the swamps and their drains on either side, while it is still within its banks) that, whenever they are directly connected with the improvement and maintenance of navigation, they should be efficiently and permanently closed.

Were the volume and elevation of the river constant from season to season, as it flows through yielding soil, it would adjust itself to its bed and find a permanent pathway. But in flood and at its low stage there are such differences of elevation, velocity, and new direction alternately flowing along the same general course, each modifying the mold of the other, and each obstructed by the other's work, that in effect they are two different streams. All these intricate questions of action and reaction, each exercising a controlling influence as the river rises, falls, or rests at the intermediate stage, have a practical bearing on the revetments and contraction works.

On April 27, 1876, the river broke through a long peninsula jutting out from the Louisiana shore in front of Vicksburg. This cut-off changed the channel, and its damaging effects may be traced for two hundred miles. The harbor of Vicksburg, once the finest on the river, began to silt up, and the changes were so rapid and so alarming that a board of engineer officers was convened, who recommended revetments and dikes, followed by dredging out of the harbor, and, if these prove insufficient, that the Yazoo River be diverted, to assist in keeping open the lake that is forming. Congress has already expended \$229,000 on these works; but, before they had progressed sufficiently to arrest the filling process, the lower part of the harbor received so much deposit that it goes dry at twenty feet above low water. Though the upper end is still open, the channel is so circuitous that at low stage the wharfbats are moved down below the bar two miles from the old landing. The dredging and revetment now needed will cost \$436,000. Only after their completion need the question of diverting the Yazoo be considered.

Above St. Louis the Mississippi is a clear river. The Missouri brings a vast amount of sediment. At St. Charles, in 1879, the sediment, by weight amounted to $\frac{1}{8}$ part of the total river-discharge, and on July 4th it was $\frac{1}{7}$ of the discharge. If no sediment is derived from the upper river, the average sediment ratio of the Mississippi below the junction is $\frac{1}{15}$. The effect of this sediment is felt far down. At Carrollton it averages $\frac{1}{100}$ and at Columbus $\frac{1}{25}$. The low-water discharge at St. Louis is about 47,000 cubic feet per second; the high-water discharge is twenty times as great. At St. Louis the range in stage is thirty-seven and at Cairo fifty-one feet.

Between St. Louis and the mouth of the Ohio the Mississippi flows within rock bluffs, or else wanders between alluvial valleys with

caving banks. There are points of shifting shoals and bad navigation wherever the river is more than 2,500 feet wide. At Kaskaskia, sixty-three miles from St. Louis, and sixteen miles below that city, at Widow Beard's Island, during low water, the channel gave four feet. A uniform minimum depth of ten feet is attainable by the same means applied to the lower river, except at Grand Chain, where removal of boulders and points of rock is advisable.

The committee desire additional legislation to define their powers and appoint the manner in which owners are to be compensated for material used. An ascertained authority over the river and over the newly-formed banks, where willows and other trees must be planted, is necessary to prosecute the work successfully. The report of the commission is a statement of facts, not theories. None the less it is a conclusive argument against outlets, and for closed gaps, continuous levees, narrow banks, and the jetty system. The Atchafalaya is an "outlet," and apparently one of most formidable proportions. Between 1851 and 1870, at its head, the cross-section increased from 24,400 to 52,100 feet. Between 1878 and 1879 the discharge swelled from 120,000 to 180,000 cubic feet per second. Within fifty years the discharge of that river has trebled. Already one sixth of the volume of the Mississippi passes through the Atchafalaya. "The elevation of the water-surface of the junction of Old River and the Mississippi," says the report, "is almost constantly above that at the head of the Atchafalaya, the difference on the 13th of last October being $7\frac{3}{4}$ feet in a distance of about five miles." A fall like this of over a foot a mile is sufficient to drain the Mississippi, which is now, with the Red River, tributary to the Atchafalaya. Those whose zeal without knowledge propose outlets as a remedy for all perils by shoal and flood, should learn by the "inexorable logic of events" that the bed of the Atchafalaya has been deepened and its flood-surface lowered by the additional volume of water sweeping through it; while the Mississippi, under the injurious effects of its outlet, shows a higher elevation of the flood level, menacing the country above Red River with overflow; and the lower river, shorn of its due proportions, can no longer sweep out its own pathway, bearing onward silt and *débris* through stable banks and jetties to drop them into the deep waters of the Gulf of Mexico.

The report embodies the results of a careful study of data in regard to slope, velocity, sediment, and the mutual relations of river sections under different conditions of discharge and curvature and reservoir action. "It needs no argument to prove that drainage and reclamation of swamps and wet lands generally must be destructive of the natural reservoir action, and hence that the variations of volume of any given stream will be more extreme

as agricultural improvements are extended and perfected." Eliminating all hypothetical arguments, they sum up their views by restating from their first report:

If the normal volume of water in a silt-bearing stream, flowing in an alluvial bed of its own formation, be permanently increased, there will result an increase of velocity, and consequently of erosion and silt-bearing power, an increase of area of average cross-section, an ultimate lowering of the surface slope; and, conversely, if the normal flow be decreased in volume, there will ensue a decrease of velocity, silt-transporting power, and mean sectional area, and an ultimate raising of the surface slope.

The Mississippi makes its own bed, and where there is a deposit of sediment there the current lacks strength to carry it on. Wherever there is a permanent channel there the force of gravity and the force of the current are in equilibrium. Levees compress the current and make it sweep out obstructions. An expenditure of \$2,000,000 could, within two years, restore the levees and effect these results. In giving safety to navigation the concomitant would be security to agriculture and commerce within the vast area affected. Levees must be continuous to be protections, yet States are constitutionally forbidden to combine for this or any other purpose. The Federal Government alone has the power and the right to institute measures to prevent the deterioration which is taking place in the noblest stream on the face of the globe. It is fast becoming useless for navigation, and a source only of overwhelming disaster to the dwellers on its banks.

MISSOURI. The presidential vote in 1880 was as follows: for the Hancock electors, 208,609; Garfield electors, 153,567; Weaver electors, 35,135. The Legislature, consisting of 25 Democrats, 7 Republicans, and 2 Greenbackers in the Senate, and 98 Democrats, 42 Republicans, and 3 Greenbackers in the House, met on the 5th of January of the present year and remained in session until the 28th of March. On the 18th of January Francis M. Cockrell was re-elected United States Senator. The vote was as follows:

PARTIES.	Senate.	House.
Francis M. Cockrell, Democrat	24	94
David P. Dyer, Republican	5	37
G. B. De Bernard, Greenbacker	2	4
James O. Broadhead, Democrat	1
Total	31	136

A constitutional amendment was adopted for submission to the people providing for increasing the number of the judges of the Supreme Court to six, and for dividing the court into two branches.

The April election in the city of St. Louis resulted in the election of the Republican candidates. The following are the majorities of the successful candidates, out of a total vote of 36,357:

Ewing, Mayor	16,255
Adreon, Comptroller	6,358
Merrell, Treasurer	4,970
Smith, Auditor	3,656
Berg, Register	5,438
Hudson, Collector	1,257
Thomas, Marshal	5,090
Rudolph, Weights and Measures	4,582
Powers, President of Board of Assessors	4,424
Flad, Board of Public Improvements	7,699
Parker, President of City Council	5,058

The Republican candidates for the Council had majorities ranging from 4,000 to 5,000.

The number of children of school age in 1880 was 702,153; in 1881 it was 725,806, an increase of 23,653. The amount of public-school money distributed in 1880 was \$515,286.09; in 1881 it was \$519,001.16, an increase of \$3,715.07. The per capita in 1880 was 73 $\frac{3}{10}$; in 1881 it was 71 $\frac{5}{10}$.

The State debt of Missouri, according to the State Auditor's last report, dated January 1, 1881, was \$16,259,000. This did not include \$250,000 revenue bonds, then outstanding but since paid, nor the \$3,000,000 bonds loaned to the Hannibal and St. Joseph Railroad. The face of these bonds has since been paid into the State Treasury, but the bonds not redeemed. The money remains in the Treasury. The above amount of \$16,259,000 was contracted on account of the following railroad companies and other objects named:

St. Louis and Iron Mountain Railroad ..	\$1,361,000
Cairo and Fulton Railroad	267,000
North Missouri Railroad	1,694,000
State debt proper	439,000
Pacific Railroad	2,971,000
Consolidation	2,727,000
Platte County Railroad	504,000
State University	201,000
Northwestern Lunatic Asylum	200,000
State Bank stock refunding	104,000
State funding	1,000,000
Penitentiary indemnity	41,000
Renewal funding	3,550,000
School-fund certificate indebtedness	900,000
Total	\$16,259,000

This debt bears 6 per cent interest, and is due as follows:

In 1882	\$17,000	In 1890	\$242,000
In 1883	422,000	In 1892	401,000
In 1885	4,000	In 1894	504,000
In 1886	1,922,000	In 1895	3,228,000
In 1887	3,242,000	In 1896	425,000
In 1888	3,251,000	In 1897	588,000
In 1889	863,000		
Total			\$16,259,000

The \$900,000 indebtedness to the school fund is nominal only, as it is simply the amount of a debt due by the State to itself.

Some difficulty exists as to the bonds issued to the Hannibal and St. Joseph Railroad Company, because they have an average of some ten years to run, and bear 6 per cent. The State has no use at present for the money. It lies unproductive in the Treasury, while the bonds draw interest. The Fund Commissioners maintain that the law under which the road accepted the loan compels the company to hold the State harmless as well for the interest as the principal. The company claims that, having paid the principal and all interest to date,

under the law of 1865, it has discharged its entire obligation. This matter is in litigation. As the State could not realize, by the purchase of its own bonds not yet due or subject to call, more than 3 per cent, or $3\frac{1}{2}$, and could not realize even this much by depositing the money, the matter involved is the difference in interest—say 3 per cent—on \$3,000,000, or such portion as could not be used for such time as must elapse till State bonds in excess of the resources of the ordinary sinking fund became payable. Under the provisions of the State Constitution, there must be collected for the sinking fund not less than \$250,000 annually. With the increasing resources of the State and the diminishing interest charge, it will be easy to pay the entire debt as early as its terms permit its payment, and indeed it could be paid in ten years without inflicting an onerous burden on the people.

Early in the year the Secretary of State made a call on all the banks and bankers in the State for a statement of their financial condition on the 31st day of December, 1880. From these statements, and like statements made by the national banks of the State for the same day to the Comptroller of the Currency, the loans and discounts were \$45,661,794; the loans on real estate, \$2,104,708; amounts invested in stocks and bonds, \$5,266,238; invested in real estate, \$1,191,628; cash and cash items (including amounts due from banks and good on sight-draft), \$25,152,794; sight deposits, \$46,592,565; time deposits, \$9,183,688; due banks, \$9,505,892; amount of capital, \$13,784,006; surplus, \$4,645,259. Total assets, \$87,030,987. On the date of this statement there were in the State 108 incorporated banks, 81 private banks, and 21 national banks.

On the 28th day of December, 1878, the statements of the banks of the State of that date showed the following: Loans and discounts, \$29,069,159; loans on real estate, \$1,969,013; stocks and bonds, \$5,947,616; real estate, \$2,227,765; cash and cash items, \$18,597,350; sight deposits, \$25,023,590; time deposits, \$8,805,357; due banks, \$6,147,189; capital, \$14,645,045; surplus, \$4,227,862; total assets, \$61,647,550. The total number of banks in the State at the date of this statement was: Incorporated banks, 110; private banks, 68; national banks, 21. The increase in the two years in loans and discounts is \$16,592,635; in loans on real estate, \$235,695; in cash and cash items, \$6,555,444; in sight deposits, \$21,569,066; in time deposits, \$378,331; in amounts due banks, \$3,458,703; in surplus, \$417,397; in total assets, \$25,383,437; and the decrease as follows: In amount invested in stocks and bonds, \$618,378; in real estate, \$236,137; and in capital, \$861,039.

The internal revenue receipts for the fiscal year ending June 30th, as compared with those of the previous year, for Missouri, were as follows:

DISTRICTS.	1880.	1880.
First district.....	\$5,543,384	\$4,680,266
Second district.....	66,451	61,636
Fourth district.....	888,471	832,996
Fifth district.....	145,572	118,826
Sixth district.....	326,822	259,980

On July 1st the State Fund Commissioners issued the certificate of indebtedness required by the act of March 23, 1881, to be deposited in the State Treasury for the permanent school fund of the State and for the seminary fund. The first-named certificate was for the sum of \$2,909,000, payable thirty years from date, at 6 per cent interest, and was in lieu of the 2,009 Missouri State 6 per cent bonds and the \$900,000 certificate of indebtedness held in trust by the State for the permanent school fund.

The second certificate was for \$122,000, running thirty years, with 6 per cent interest, and was in lieu of the 122 Missouri 6 per cent bonds held in trust by the State for the seminary fund.

These certificates are to be held and remain a sacred and irrevocable obligation of the State, unconvertible and untransferable from the purposes of their issue, and are to continue as representing the respective amounts of the permanent school and seminary funds of the State.

The State, according to the Federal censuses of 1880 and 1870, produced 24,971,727 and 14,315,026 bushels of wheat and 203,464,620 and 66,034,074 bushels of corn in the respective census years. Of tobacco, the yield in 1880 was 11,994,077 pounds. In the same year 556,304 tons of coal were mined.

The following list shows the valuations placed by the county assessors and the State Board of Equalization on the taxable property of the State for the year 1880. The total shows an increase, over the valuation of two years previous, of \$40,855,821:

PROPERTY.	In the city of St. Louis.	Total in State.
Lands.....		\$227,006,710
Town-lots.....	\$139,704,290	179,097,716
Horses.....	505,070	22,281,872
Mules.....	113,120	7,683,088
Asses and jennets.....		187,997
Cattle.....	151,180	22,181,795
Sheep.....	850	2,845,821
Hogs.....	8,870	6,068,645
All other live-stock.....		185,484
Money, notes, and bonds.....	7,712,200	45,506,845
Corporate companies.....	6,578,500	8,202,708
Brokers and exchange dealers.....	58,000	1,745,538
All other personal property.....	10,572,980	47,022,780
Total in St. Louis.....	\$165,734,540	
Grand total in the State.....		\$569,369,785
Total values in 1878.....		528,513,964
Increase.....		\$40,855,821

The above does not include the values of railroads, bridges, telegraph companies, etc. The value of those classes of property amounts to about \$40,000,000.

The following table exhibits the gross re-

ceipts and shipments of cotton at St. Louis for three years, by months :

Total.....	41,372	46,011	43,351	44,416

A convention for the improvement of the Mississippi River and its tributaries was held in St. Louis during three days commencing on the 26th of October. It was called under the auspices of the Merchants' Exchange of St. Louis. The basis of representation was two delegates for every hundred members of each board of trade and cotton exchange in each city situated on the Mississippi River and its tributaries, and each board of trade and cotton exchange was entitled to at least two delegates; and where no boards of trade exist the mayors of said towns and cities were requested to appoint two delegates; the Governors of the States and Territories of the Mississippi Valley were requested to appoint ten delegates from the States and five from the Territories as delegates at large.

The members of each House of Congress were specially invited to attend; also, the Governor of each State in the Union.

The call stated that, "while the national Government has given to the various railroads up to the year 1878 nearly two hundred million acres of the public domain, worth at least \$1.25 per acre, and to some it loaned its credit besides—for anticipated benefits to the people—during this time the Mississippi River and its tributaries have had appropriated for their im-

provement an amount not quite twenty million dollars."

The convention was well attended. The following resolutions were adopted:

The representatives of the commercial interest and agricultural and other productive industries of the Mississippi Valley, in convention assembled at St. Louis, Missouri, believing that the Mississippi River and its navigable tributaries, the great inland waterways prepared by the Creator for the use of the people, are a most important and valuable part of the national domain, free to all beyond the reach of monopoly, and affording to the whole people that competition in transportation which benefits both producer and consumer alike; and further, that cheap transportation is the great necessity of an agricultural people, the indispensable condition of the easy conveyance to distant markets of their staple products, bulky in proportion to value, and that the familiar economical truth, that the cheapest transportation of such products is by water, is especially applicable to the great water-ways of this country, provided the same be kept free from snags, sand-bars, treacherous banks, and other obstacles to navigation, do therefore resolve and declare:

1. That it is the manifest and imperative duty of the Government of the United States to cause to be made such improvement of the Mississippi River, and its navigable tributaries, as shall permanently secure the safe and easy navigation thereof, thereby cheapening freights, reducing insurance and other burdens and expenses; promoting the vast inland commerce of the nation and creating new avenues of foreign trade, and thus not only inviting increased production and population, but assuring greater prosperity to the whole people. Especially is this duty obvious, and our demand justified, in view of the donations already made by Congress in land, amounting to nearly 200,000,000 acres, and in bonds issued or guaranteed, nearly \$100,000,000 more, in aid of artificial highways, the property of private individuals, and necessarily furnishing, even at lowest rates, the most costly form of transportation on a large scale, as compared with appropriations not yet amounting to \$25,000,000 in all, for the improvement of 15,000 miles of natural water-ways, whose freedom from tax imposed or monopoly is protected by constitutional guarantees, while the cheap service and unrestricted competition they afford is the most effectual corrective of exorbitant charges by any route to the sea-board. That the appropriations for such improvements should be separately made, with due provision for assuring the people of their faithful applications to the same, and should be adequate to the continued prosecution of the work once begun until the same is finished, so as to avoid the wasteful destruction of work partially completed by reason of the delay or stoppage thereof for want of sufficient appropriations. And be it further

Resolved, That this convention recognizes with extreme satisfaction and emphatic approval in the passage of the act of Congress of June 28, 1879, "for the appointment of a Mississippi River commission," and in the comprehensive and scientific surveys and important recommendations made by the distinguished engineers appointed on that commission, as set forth in their reports of February 17, 1880, and January 8, 1881, the first well-considered and effectual step toward the complete and permanent opening of the Mississippi Valley to the markets of the world; but would also strongly express its regret at the refusal of the last Congress, after creating said commission, and notwithstanding the deliberate and emphatic approval of their plans by the House Committee on Improvement of the Mississippi, to appropriate the amount estimated and recommended by said commission for doing the work by them carefully laid out and proposed. And be it further

Resolved, That in the deliberate and earnest judg-

ment of this convention, delegated to represent the interests in that behalf of more than one half the States and Territories of the Union, inhabited by more than one half of its entire population, from whom is collected above 70 per cent of the entire internal revenue of the nation, whose internal commerce is already one half that of the whole United States, more than twelve times greater than the total foreign commerce of the nation, and larger than the total foreign commerce of the world—but upon whose industry is this year levied, by the obstacle to the safe and easy navigation of the Mississippi River and its navigable tributaries, a needless direct tax, by way of increased freights and insurance, demurrage, wrecks, and repairs of not less than \$10,000,000, it is the imperative duty of Congress and the right of the people, for whom this convention is authorized to speak, that the legislation thus wisely begun be made effectual and permanent by enlarging the powers of the river commission to include the active prosecution of the works already recommended by them, and by the regular and separate appropriations from year to year of such sums as said commission, acting under the reasonable supervision of Congress, shall report as necessary to that end; so that this great and indispensable work, national in every sense, shall no longer be delayed. And be it further

Resolved, That the scientific and comprehensive system of river improvement, by a competent commission thus inaugurated, should be applied to the complete and permanent improvement and maintenance of all the navigable tributaries of the great river. And be it further

Resolved, That this convention recognizes with great satisfaction the benefits already resulting to the navigation of the Mississippi River and its principal tributaries by the extension of the light-house system thereto; and expresses the earnest hope that the partial lighting of those rivers may be speedily enlarged by increasing the number of districts and lights to such an extent as the Light-House Board, in consultation with the river commission, shall find necessary to render such service completely efficient. And be it further

Resolved, That the president of this convention be and he is hereby authorized and requested to appoint at his early convenience a committee of twenty-one, who shall be charged with the duty of preparing, as soon as practicable after the convention adjourns, a memorial to the Congress of the United States, on behalf of the delegates composing this convention and the people whom they represent, in support of and in accordance with the foregoing resolutions, embodying such statistics and information as said committee may deem expedient; that they cause to be printed a sufficient number of copies of said resolutions and memorial, together with the proceedings of this convention, for wide distribution, and that a copy thereof be placed in the hands of each member of the United States Senate and House of Representatives as soon as practicable; and that said committee be and they are hereby authorized to take such further action touching the proper presentation of said resolutions and memorial to Congress and procuring the due consideration thereof as they may deem best.

Resolved, That in the interest of cheap transportation, and to afford a choice of water routes to the sea-board, we regard connections between the navigable waters of the upper Mississippi River and the Great Lakes as of great importance.

This convention was followed by a Missouri River Improvement Convention at St. Joseph, on the 29th of November, in which four States and two Territories were represented. The following are the resolutions adopted:

We, the people of the Missouri Valley in convention assembled, after careful and deliberate consultation, hereby declare that the improvement of the navi-

gation of the Missouri River is a matter of national interest and importance; that if the millions of fertile acres that lie upon its banks are afforded the advantages of cheap water transportation, its breadstuffs and products will cheapen the cost of living throughout the entire country; that in the distribution of the public money for the improvement of the navigable rivers of the country the Missouri River has been practically ignored; that the annual appropriation of a few thousand dollars for the improvement of this or that harbor, or the protection of some threatened point, is of no advantage or benefit in promoting the general usefulness of this waterway: therefore

Resolved, That we, the citizens of the States of Missouri, Kansas, Nebraska, and Iowa, and the Territories of Dakota and Montana, in convention assembled, do hereby appeal to the Congress of the United States for the creation of a Missouri River commission to consist of seven members—three Government engineers and four citizens—one from Missouri, one from Kansas, one from Nebraska, and one from Iowa; that an adequate appropriation be made to be expended by said commission for the general improvement of navigation of the Missouri River.

Resolved, That we hereby instruct our Senators and Representatives in the Congress of the United States

to use all efforts to secure the necessary legislation to accomplish these results.

Resolved, That the State delegations in this convention shall appoint three citizens from Missouri, three from Kansas, three from Iowa, three from Nebraska, one from Dakota, and one from Montana, who shall form a committee to memorialize Congress, to prepare and present statistics, and in every legitimate manner aid our Representatives in securing from Congress adequate appropriations for the improvement of the navigation of the Missouri River.

Resolved, That the whole proceedings of this convention be published in pamphlet form and distributed generally among the citizens of the Missouri Valley and the Senators and Representatives in Congress.

Resolved, That we are in hearty accord with the plan for the improvement of the Mississippi River and its tributaries, and urge upon the attention of Congress the importance of making liberal appropriations therefor.

Several robberies of railroad trains occurred in the State during the year.

The population of Missouri by counties, according to the census of 1880 and 1870, is as follows:

MONROE DOCTRINE. (See PANAMA CANAL.)

MORAVIANS. The report of the Provincial Elders' Conference to the General Synod of the Northern (American) Province, made in May, 1881, stated that there were 65 ministers in actual service in the province, of whom 57 had pastoral charges, and 8 were filling other positions. Twenty-nine regular churches

* In 1876 organized as a separate municipality.

were entitled to representation in the Provincial Synod. The total number of communicants was 8,231, and the whole number of souls connected with the Church was 14,356. Adding the members in the Southern Province, which might now be regarded as united with the Northern Province, the members in the whole American district of the Moravian Church were 9,561 communicants and 16,491 souls.

The permanent *Church Extension Fund* amounted, including cash and unpaid pledges, to \$16,700, or \$3,944 more than in 1878.

The *Board of Home Missions* represented in its report to the Synod that the work under its care was embarrassed from an insufficiency of funds. The amount raised by the churches of the province had been at no time, since the previous meeting of the Synod, sufficient to cover the grants made to the home missionaries, not even after the grants had been reduced ten per cent, and the treasury was now in debt. The twenty-nine home missions comprised together a membership of 1,784 communicants and 3,347 souls; while eleven of them were free from debt, the other eighteen owed in all \$32,318, and the total value of their property was about \$91,800.

The *Theological Seminary* graduated seven students in 1879 and 1880, and had four students in its theological class, and twenty-three students in all its classes.

The receipts, mostly from interest and dividends, of the Missionary Society, the *Society for Propagation of the Gospel among the Heathen*, were reported, at the anniversary of the society, August 31st, to have been, for the year, \$12,508. The Indian Mission at New Fairfield, Canada, was served by one missionary, with a lay assistant and a teacher. Its expenses were paid, in large part, from the proceeds of a farm attached to it. The mission, also to the Indians, at New Westfield, Kansas, was not in so prosperous a condition. The contributions of the churches for foreign missions during the past three years were stated in the report of the Unity's Elders' Conference to have been \$10,362, a larger amount than had ever before been raised in the province during the same period of time.

The *Provincial Synod* of the Northern Province met at Bethlehem, Pennsylvania, May 18th. The meeting was a special one, called to consider the financial condition of the province, which the Provincial Elders' Conference represented as being exceedingly bad, with a large amount of the assets unproductive and the income falling below the expenditure by between four and five thousand dollars every year. The existence of this condition was explained by showing that some of the enterprises in which the Synod had embarked had proved unfortunate. The attention of the Synod was given chiefly to the consideration of measures of retrenchment, and of the means by which its financial condition could be improved.

A series of resolutions, defining the relations of the Synod to the Church at large, was adopted. The resolutions declare, in effect, that the Synod recognizes that it is only as an integral part of the Brethren's Unity that the American Province has any right to present separate existence among the churches of the United States; that it considers itself "firmly held by the bond of doctrine, ritual, discipline,

constitution, the work of education, home, foreign, and Bohemian missions, which unite the several provinces of our Church in a unity of brethren"; that the interests of all the parts of the Synod's province are one and the same, and indivisible; and that the Synod disapproves of all appeals to sectional feeling or assumed sectional interests, "and, further, of all threats, open or implied, as contrary to the spirit of the Brethren's Unity." Two delegates were present from the Southern Province, to present a plan for the union of the two synods, which had been agreed to by the synod of that province. The plan, providing for the union of the two provinces upon a footing of corporate equality, under the operation of which the Southern Province is to be constituted the Wachovia District, was adopted unanimously on three different votes, taken on three successive days. By its provisions, the Southern congregations will send their full quota of delegates to the next meeting of the Synod, in 1884, which is then to be constituted the first regular United Synod of the American Province. An Advisory Board of Laymen was constituted, to consist of an equal number of members with the Provincial Elders' Conference, and to act with that body as a joint board for the management and control of all the financial affairs of the province not otherwise specially provided for. The rule prohibiting the organization of new congregations by division or colonization from other congregations, without the express sanction of the provincial synod having been previously obtained, was repealed. A rule was adopted prohibiting the consecration of new church buildings till all of the building expenses shall have been provided for. The right of any congregation to lay representation in provincial synods was declared to be contingent upon its providing for an actual and adequate salary of its minister, and for the necessities of its church establishment, "without any fixed or regular aid from the general funds of the Church, during the interval between the previous synod and the synod about to convene," except in the case of the first application of the congregations for representation, which was left to be accorded by special act of the Synod. The Synod further ordered "that no home-mission church which counts on aid from the province shall build a church or a chapel without the express sanction of the Church Extension Board"; that a plan for the building and estimates of the cost should be laid before the board for approval; and that it should have authority to reject any plan that should be found unnecessarily expensive.

The reports of the *British Province*, in which the Irish churches are included, show that in 39 congregations the number of "souls" in 1880 was 5,706, against 5,423 in 1870, and the number of communicants was 3,302 in 1880, against 3,236 in 1870.

MORGAN, LEWIS HENRY, born near Aurora, New York, November 21, 1818; died in Rochester, New York, December 17, 1881. He graduated at Union College in 1840 and studied law until 1844. About that time he joined a secret society known as the "Grand Order of the Iroquois," and this had immense influence on his future career. The organization was modeled after the pattern of the Indian tribes, and, to become better acquainted with their social polity, young Morgan went among the Indians of his State, and permitted himself to be adopted by a tribe of Senecas. The Grand Order of the Iroquois flourished for a long time. The ceremonies were very picturesque and attractive, being conducted in the woods by night, and illuminated by immense camp-fires. The sachems, dressed in the Indian costume, with plumes of eagle-feathers and beautiful moccasins, partook with great enjoyment in the wild sports. But Mr. Morgan's business claims finally obliged him to abandon the society, and his departure caused the decay of the order. He published from his ample store of material a volume of great interest, called "The League of the Iroquois," in which he explained the organization and government of their wonderful federation. Their daily life, their superstitions, customs, and traditions were ably treated of, and this work gives the first scientific account of an Indian tribe ever published. It appeared in 1851.

The field of research he had entered was so vast, and the study so fascinating, that Mr. Morgan devoted all his spare time to it. In 1858 he went to Marquette and found an encampment of Ojibway Indians; he discovered, with much surprise, that while the language was essentially different, the organization and system of government in this tribe were precisely the same as those of the Iroquois. It naturally occurred to him that the similarity of characteristics in tribal governments might extend further, and he determined to pursue his investigations among other Indians. With this object in view, he issued schedules of inquiry for circulation among persons conversant with Indian life, and distributed them far and wide. The Smithsonian Institution rendered him much assistance, as did also General Cass, who was at that time Secretary of State. The returns came in so slowly that, to expedite matters, he

went through Kansas and Nebraska, to the Hudson Bay Territory and Lake Winnipeg, to Fort Benton and the Rocky Mountains. From the tribes of these sections he gleaned an amazing amount of information, to which were added the returns from his schedules, which began to pour in from all quarters. Not only was the kinship of the Indians investigated, but that of a large portion of mankind.

The Smithsonian Institution published the result as one of its "Contributions to Knowledge," under the title of "Systems of Consanguinity and Affinity of the Human Family." It is a quarto volume of 600 pages, and a wonder of patient research. The kindred systems of eighty tribes of North American Indians, together with those of a great number of the principal nations and tribes of the Old World and the islands of the sea, are fully recorded in its pages. During the earlier years of his labors in this great undertaking, Mr. Morgan carried on an extensive law practice, and was engaged upon a railroad enterprise in Michigan. On the shores of Lake Superior he became absorbed in the study of the beaver, and in 1868 he published "The American Beaver and his Works." His researches were extended to many subjects not comprised in the volume published by the Smithsonian Institution. He contributed a number of articles to the "North American Review," the first of which was printed in 1869, and entitled "The Seven Cities of Cibola." He came to the qualified conclusion that the ruins on the Chaco, in New Mexico, represent what remains of the so-called cities described by the ancient Spanish travelers. In 1871 he published what he considered to be the great work of his life, under the title "Ancient Society." It is divided into four parts, as follows: Part I, "Growth of Intelligence through Inventions and Discoveries"; Part II, "Growth of the Idea of Government"; Part III, "Growth of the Idea of Family"; Part IV, "Growth of the Idea of Property." Mr. Morgan presided over the last meeting of the American Association for the Advancement of Science, and his last work is the "House-Life and Architecture of the North American Indians." He was a member of the New York Assembly in 1861, and of the Senate in 1868. Upon the subjects treated of in his publications he was considered an authority in this country and abroad.

N

NATURALIZATION IN THE UNITED STATES: ITS VALIDITY. An important question of naturalization was raised during the year, and left pending at its close, by Secretary Blaine's protest against the decision given in the Buzzi case by Count Lewenhaupt, acting as umpire, under the agreement between Spain and the United States, for the arbitra-

tion of claims of citizens of the United States for property seized by the Spanish authorities during the Cuban rebellion. Buzzi claimed to be a naturalized citizen of the United States, and presented his naturalization certificate to the commission. The umpire decided that the certificate was not valid, and hence that Buzzi was not entitled to appear before the commis-

sion as an American citizen. Mr. Blaine took the ground that a certificate of naturalization was conclusive evidence of citizenship. To get a clear understanding of the issue thus raised, it is necessary to give some facts concerning the arbitration agreement, and the diplomatic correspondence which preceded it.

The commission was created in 1871, "for the settlement of the claims of citizens of the United States, or of their heirs, against the Government of Spain, for wrongs and injuries committed against their persons and property by the authorities of Spain in the Island of Cuba, or within the maritime jurisdiction thereof, since the commencement of the present insurrection." One of the points most discussed in the diplomatic correspondence that preceded the agreement related to Cubans claiming to be naturalized citizens of the United States. Spain did not deny that a Spanish subject who had been duly naturalized in the United States and had become a citizen of this country in good faith, would be entitled to recognition as an American citizen. But it alleged that notorious frauds had been practiced by Cubans in getting naturalized for no other purpose than, while living and carrying on business in Cuba, to escape the duties and penalties of Spanish subjects under the cloak of American citizenship. It asserted that in many cases naturalization papers, though regular on their face, had been obtained fraudulently or without due compliance with the American laws. On this point Mr. Sagasta, the Spanish Minister of State, in a note, dated September 12, 1870, to Mr. Sickles, the American Minister at Madrid, said: "The good faith of the United States Government has been imposed upon and made use of by worthless men, whose only object is to create international complications and conflicts. The data and official documents of the Spanish Government enable it to make a classification of the greater part of these claimants, reducing them to three classes, namely: first, claimants who have never possessed a right to foreign nationality; second, individuals who enjoy its benefits, but whose property has never been embargoed; and, third, persons to whom, in consideration of their being foreigners, their embargoed estates have been restored on the least evidence. Moreover, the Government of the United States can not be ignorant of the fact that the greater portion of the natives of Cuba, who have given allegiance to the American flag, have done so with the studied intention of making use of it at some future day as a shield for their criminal designs. Many cases might be cited of individuals who have lived in the Island of Cuba as Spanish citizens, and did not remember their American citizenship until affairs went against them. These abuses caused the issue of the important instructions concerning the rights of citizenship communicated by the Department of State of the United States, on the 3d of May, 1869, to their consul-general

at Havana, it being noticeable that these instructions were given at the request of the said officer, who continually found himself embarrassed by the reclamations of Cubans naturalized as Americans, who had returned to Havana and resided there permanently without disclosing their change of nationality; some of them having accepted employment as officers which Spanish subjects are alone entitled to hold."

In reply to this, Mr. Sickles, on October 14, 1870, under instructions from Secretary Fish, wrote that "in regard to the first classification, that is to say, those 'claimants who have never acquired a foreign nationality,' the Government of the United States will not be found disposed to extend its protection to persons who have not the right to invoke it. It is to be presumed, until the presumption is overcome by proof, that aliens who have deliberately renounced, after an uninterrupted residence of five or more years within the territory of the Union, all allegiance to any other government, and have thereupon become citizens of the United States, are sincere in their solemnly-avowed purpose. If it shall be made to appear that any one of the claimants in whose behalf the Government of the United States intervenes is not a citizen thereof, or, having been naturalized in conformity with its laws, has by any act of his own forfeited his acquired nationality, or that he has voluntarily relinquished it, your Excellency may rest assured that the case of such claimant will be dismissed from the further consideration of the American Government. The Government of the United States, having satisfied itself that the parties in whose behalf reclamations have been addressed to the government of his Highness the Regent are entitled to claim the protection due to American citizens, awaits the production of such proofs as may be exhibited on the part of the Spanish Government to show that such protection is not rightfully solicited and granted."

Subsequently (November 18, 1870) Secretary Fish instructed Mr. Sickles that "the President contemplates that every claimant will be required to make good before the commission his injury and his right to indemnity. Naturalized citizens of the United States will, if insisted on by Spain, be required to show when and where they were naturalized, and it will be open to Spain to traverse this fact, or to show that from any of the causes named in my circular of March 14, 1869, the applicant has forfeited his acquired rights; and it will be for the commission to decide whether each applicant has established his claim." These views were communicated to the Spanish Minister of State by Mr. Sickles in his note of January 8, 1871.

In the light of this correspondence the arbitration agreement was made. It created a commission to consist of two arbitrators, one chosen by the United States and the other by

Spain. The arbitrators were to select an umpire. Article V of the agreement stipulated that "no judgment of a Spanish tribunal disallowing the affirmation of a party that he is a citizen of the United States shall prevent the arbitrators from hearing a reclamation presented in behalf of said party by the United States Government. Nevertheless, in any case heard by the arbitrators the Spanish Government may traverse the allegation of American citizenship, and thereupon competent and sufficient proof thereof will be required. The commission having recognized the quality of American citizens in the claimants, they will acquire the rights accorded to them by the present stipulations as such citizens." The agreement concludes with the declaration that "the two governments will accept the awards made in the several cases submitted to the said arbitration as final and conclusive, and will give full effect to the same in good faith and as soon as possible."

In the case of Pedro D. Buzzi, who presented a claim of five hundred thousand dollars, the arbitrators were unable to agree as to his right to appear before the commission as an American citizen. Buzzi was a Cuban who obtained a naturalization certificate in Baltimore in 1869. The law requires the applicant for citizenship to make affidavit that he has resided five years in the United States immediately preceding the application. It was proved before the commission that Buzzi had lived in the United States only six months of the five years preceding the date of his naturalization. The remaining four and a half years he had lived in Cuba. The counsel for Spain claimed that Buzzi's certificate had been fraudulently obtained, and that Buzzi was not entitled to appear before the commission as an American citizen. The counsel for the United States did not deny the facts on which the allegation of fraud was based, but argued that the certificate must be accepted as conclusive evidence of citizenship. The question was referred to the umpire, Count Lewenhaupt, the Swedish Minister at Washington. After reviewing the parts of the diplomatic correspondence preceding the arbitration agreement, which are given above, and citing Article V of the agreement, Count Lewenhaupt says in his decision: "In the opinion of the umpire this correspondence shows that by neither party was the convention intended for the benefit of other in the United States naturalized Spaniards than those who have been naturalized in good faith, and, conformably to the proposal of Mr. Sickles, it was agreed that naturalization, after an uninterrupted residence of five or more years, should be considered as a conclusive test. The umpire is of opinion that Article V of the agreement, interpreted in the light of the correspondence, and only with reference to the present case, stipulates that the Spanish Government may traverse the allegation that the claimant has acquired American citizenship in

good faith, and thereupon proof satisfactory to the commission will be required of an uninterrupted residence in the United States during the five years immediately preceding the naturalization." He accordingly decided that Buzzi's naturalization certificate had been fraudulently obtained, and therefore gave him no right to appear before the commission.

When this decision was rendered, Mr. Blaine directed the counsel for the United States to move for a rehearing of the case, but in a note dated November 30, 1881, a short time before his retirement from the State Department, Mr. Blaine withdrew that direction and instructed the counsel that "this Government can not accept such judgment [the decision of Count Lewenhaupt] as within the competence of the umpire to render, and that it can not submit the cases remaining unsettled on the docket to the application of principles distinctly repudiated by the agreement itself." Mr. Blaine's protest was based on the ground that the commission had no right to go behind a naturalization certificate, but must accept it as conclusive evidence of citizenship. In support of this view, he cited three decisions by two former umpires under the agreement, and claimed that the doctrine affirmed by them was binding upon every subsequent umpire. One of these decisions was that rendered in the Delgado case by M. Bartholdi, Minister from France. In his opinion, M. Bartholdi held: "That the claimant [Delgado] has been naturalized an American citizen according to the laws of the United States; that the judge who ordered him to be admitted a citizen of the United States was, as it has been decided in many cases by the Supreme Court of the United States, the competent authority to decide if the claimant had sufficiently complied with the law, which prescribed a continued residence of five years in the United States before having a right to obtain the naturalization."

In the subsequent case of Dominguez, the umpire, Baron Blanc, the Italian Minister, said: "Finally, neither the authorities on public law nor the agreements between Spain and the United States, furnish any unquestioned and controlling definition of what constitutes, in fact, a legal residence with presumable *animus manendi*, and when absence intervenes with presumable *animus revertendi*, such as would justify or empower the umpire to overrule by force of treaties, or of the law of nations, the construction placed by a court of competent jurisdiction upon a municipal law, as to the required residence in the United States for the next continued term of five years preceding the admission to American citizenship. Therefore the construction thus given, however broad it may be deemed, must be followed so long as it is unimpeached or unreversed by an American tribunal of superior jurisdiction. The tribunals of the United States are the sole interpreters of the laws of the country, and it is not the privilege of the umpire to review

their declarations as to the requirements of these laws."

In the case of Portuondo, the same umpire, Baron Blanc, decided: "That as to the traversed allegation of American citizenship of the deceased, competent and sufficient proof thereof, as required by the agreement of February 12, 1871, is given by his certificate of naturalization, such certificate not being proved or charged to have been procured by fraud or issued in violation of public law, treaties, or natural justice. Such grounds of impeachment upon which any certificate of naturalization may be declared altogether void not being found in this case, the umpire called upon to resolve such conflict about the allegiance of the deceased must, following previous adjudications by umpires of this commission and in the absence of any treaty between Spain and the United States restricting the power of the United States to grant naturalization, in accordance with municipal law, as interpreted by the municipal courts, give full force to the naturalization of the deceased even against Spain."

In his note of November 30, 1881, to the counsel of the United States before the commission, Mr. Blaine, after citing the decisions of the umpire in the above cases, says:

This Government had the right to consider these decisions as final and conclusive of the meaning of the agreement under them. From the date of the opening of the commission, by a succession of umpires, one hundred and seven cases having been tried and decided, forty cases remain on the docket. If the decisions of former umpires are to be reversed, then the forty cases are to be judged upon entirely different principles from the preceding cases. In fact, the one hundred and seven cases will have been decided under an agreement meaning an entirely different and even contradictory thing. Two claimants presenting certificates of naturalization of the same date, issued from the same court, would be the one received and the other rejected, not on any fixed principle, but according as the number of his claim on the docket brought his case under the consideration of one or the other umpire.

What effects should be given to the certificate of naturalization as it is understood by the contracting parties and declared in the stipulations of the agreement, and what power the commission itself may have to extend or limit this effect by construction, I will not now discuss; but it is evident that if the commission has or has not assumed the power to decide this question, which is one not of fact, but of construction of the intent of the argument once decided, it must be considered as settled for ever; for it is obvious that no settlement can be reached just to the claimant where the rule of construction varies with every change which may occur in the person of the umpire. And this Government must insist that all claims shall be tried by the same rules and under the same construction of the agreement between Spain and the United States. The commission is not a proper tribunal to which should be submitted the argument of the United States in this regard. Whether this course is justified by the circumstances, or whether our interpretation of the agreement be the correct one, are questions, upon the failure of the commission, to be discussed and decided by the two governments themselves. For the present it is sufficient that I refuse to recognize the power of the commission to denaturalize an American citizen. When a court of competent jurisdiction, administering the law of the land,

issued its regular certificate of naturalization to Piedro Buzzi, he was made a citizen of the United States, and no power resides in the executive department of this Government to reverse or review that judgment, and what the power of the Executive can not do in itself it can not delegate to a commission, which is the mere creation of the Executive agreement. . . .

Therefore, as this Government perceives that, in the following out practically of the recent decision of Count Lewenhaupt, serious damage would be done the United States, by setting aside of the most important safeguards established in our behalf by the agreement of February, 1871, as it regards the decision of Count Lewenhaupt, entirely beyond the scope of the authority given by the convention, as it is bound to respect and maintain the decision made, not by one, but by a series of former umpires, and which it has regarded final and conclusive, and as it is pledged to insist upon the application of the same law to all the claimants who may come before the commission, you are instructed not to consent to have any case referred to the umpire wherein the question may be involved of the effect due to a certificate of naturalization issued by a competent court, and in which it is not denied that the claimant presenting it is the person to whom it was originally issued.

I feel myself the more constrained to give you this instruction, as the commission is not the creation of a treaty constituting it an international court, but simply an arbitration agreed upon between one of my predecessors, as Secretary of State, and the Spanish Secretary of Foreign Affairs. To these commissioners no larger powers could be given than those possessed by the secretaries that appointed them, and I am thus personally charged with the duty of seeing that the terms of the arbitration are duly executed, and that no detriment shall come to the interests of the United States by the exercise of a power which I do not possess, and could not therefore delegate.

From the above it will be seen that Secretary Blaine based his protest mainly on the ground that the decision of Count Lewenhaupt was contrary to the principles affirmed by his two predecessors, M. Bartholdi and Baron Blanc. In the popular discussion of the subject which followed the protest, those who did not agree with the views advanced by the Secretary of State contended that his conclusion was not sustained by the authorities which he cited. The question presented in the Buzzi case was whether the commission could question a certificate of naturalization in case of fraud. The umpire found that Buzzi had lived only six months in the United States when he made affidavit of five years' residence, and decided that he had not been naturalized in good faith. In the Delgado case it appeared that the claimant had been absent from the territory of the United States only once or twice during the five years preceding his naturalization. The umpire, M. Bartholdi, found that "there is no evidence nor charge of the naturalization having been obtained by fraud," and held that, as Delgado's certificate had been obtained in good faith, its legal validity was a matter of local law, determined by the court which admitted him to citizenship. On this point the umpire in the Buzzi case seems to have entirely agreed with M. Bartholdi. While holding that the commission had a right to go behind a naturalization certificate in case of fraud, Count Lewenhaupt says, in the Buzzi case:

The umpire has been unable to find any indication in either the agreement or in the correspondence that, as contended by Spain, the commission ought to examine whether the requirements of the American law of naturalization have been fulfilled. In such case the umpire would have to examine, in the present case, not only the question of five years' residence, but also whether the declaration of intention made in 1850 was legal or not; whether it could be replaced by the declaration of intention made by the claimant's father in 1824; whether the claimant resided one year in Maryland, where he was naturalized; whether he conducted himself as a man of good moral character; whether he was attached to the principles of the Constitution, etc. It is not probable that, when the question was to determine naturalization in good faith as against Spain, either party intended an examination of these questions, because it seems entirely indifferent to Spain whether the claimant abjured his allegiance only once at the end of five years, or whether he made also a similar oath two years previously; whether, in case of five years' residence, he resided one year in Maryland, or the whole time in other parts of the United States.

In his opinion in the *Portuondo* case, Baron Blanc expressly concedes the authority of the commission to inquire into the validity of a naturalization certificate in case of fraud. He decided that sufficient proof of citizenship was given by the naturalization certificate of *Portuondo*, "such certificate not being proved or charged to have been procured by fraud, or issued in violation of public law, treaties, or natural justice." He then added that "such grounds of impeachment, upon which any certificate of naturalization may be declared void, are not found in this case." This opinion was given by Baron Blanc, after the arbitrator on the part of Spain, the Marquis de Potestad-Fornari, had filed a protest against the views expressed by Baron Blanc, in deciding the *Dominguez* case, as above quoted.

The position taken by Secretary Blaine with reference to the powers and duties of the commission, in the matter of naturalization certificates, is diametrically opposed to that taken by his immediate predecessor, Mr. Evarts, who assured the Spanish Minister in Washington, in an official communication, dated March 4, 1880, that the commission had full power to pass upon all questions of law and fact arising in the cases submitted, and that it was "beyond the competence of either Government to interfere with, direct, or obstruct its deliberations." He expressly conceded that it might inquire into the validity of any naturalization certificate, and that the judgment of the umpire, whatever it might be, was final and not open to review. His letter was written to Señor Don Felipe Mendez de Vigo, who, acting under instructions from the Spanish Government, had brought to the attention of the State Department the protest made by the Marquis de Potestad-Fornari, against the principles affirmed by Baron Blanc in the *Dominguez* case. The views then held by the State Department are set forth in the following passages of Mr. Evarts's letter:

I have no difficulty in cordially agreeing with you in the principle which you deduce from the conven-

tion of 1871 as the one which inspired both governments in their agreement to the terms of that instrument, and to which you give expression in your note in words which I willingly adopt: "From the terms of the convention of 1871, it is clearly deduced that the Government of the United States and that of Spain, being both actuated by the strictest sentiment of justice, knowing, perhaps, that the parties claiming to be American citizens had not all the necessary means of defense before the Cuban courts, and that it was possible that abuses had existed in the issuance of certificates of naturalization presented by them, thought proper in appointing the Spanish-American Commission of Arbitration to invest it with certain powers which in certain cases place it above and beyond the reach of decisions pronounced by the local courts of both nations."

It is precisely in this spirit that the Government of the United States has interpreted, understood, and accepted the functions and powers of the commission created by the agreement of the two governments, and organized in accordance with and in pursuance of the convention of 1871. This Government has from the first considered, as it now holds and feels itself bound to maintain, that the commission thus established is an independent judicial tribunal, possessed of all the powers and endowed with all the properties which should distinguish a court of high international jurisdiction, alike competent in the jurisdiction conferred upon it to bring under judgment the decisions of the local courts of both nations and beyond the competence of either government to interfere with, direct, or obstruct its deliberations. Viewing the commission in this light, the Government of the United States, as one of the high contracting parties to the convention, and also as one of the parties to the contention submitted for the determination of the commission, has felt itself bound, in accordance with the stipulations of the seventh article of the agreement, to "accept the awards made in the several cases submitted to the said arbitration as final and conclusive." An examination of the proceedings of the commission, which I have requested the advocate of the United States to make, shows that in all cases submitted for its determination thus far the American claimants have been required to establish their United States citizenship by competent and sufficient proofs, and that in no case has the right been denied to Spain to "traverse" the allegation of such citizenship, and to support such denial on the part of Spain by admissible evidence going to show that the proofs, adduced in maintenance of the claimants' demand to be considered citizens of the United States, were on their face inadmissible, or that they were unworthy of credit because of a taint of fraud in the proceedings of naturalization from which the documents emanated, or that taken together such proofs were insufficient to establish the demand of American citizenship put forth by this Government on behalf of the claimant. All this it has been competent to the representative of Spain to advance before the tribunal on behalf of his government as defense and objection to each claim presented and submitted to the arbitration of the commission.

In the proceedings with regard to the claim of Mr. Fernando Dominguez, from which the present contention immediately arises, and in regard to which, in the estimation of the Marquis de Potestad-Fornari, the decision of the umpire furnished sufficient grounds to the arbitrator for Spain to refuse his concurrence with the American arbitrator in a submission to the umpire of any future case involving a controverted question of American naturalization upon which the arbitrators should disagree, this principle appears to have been recognized by the commission in the most liberal sense, and the inquiry as to the question of the citizenship of the claimant was apparently pursued to the utmost scope and limit of judicial investigation.

It was the intention of the Government of the United States, and I do not doubt that it was also the intention of the Government of his Catholic Majesty,

to eliminate from the field of diplomatic discussion a class of cases which could hardly be diplomatically handled in detail with satisfaction to either party, and to create a tribunal which should fairly and impartially judge them without question or appeal in the interest of universal equity, and especially in that of the traditional good understanding which has so long united both governments. The President charges me to express the hope that nothing may be suffered to interrupt the regular progress of the work of the commission; and that, relying upon the intelligence and the impartiality of the arbitrators, the Governments of Spain and of the United States may accept and carry into effect the decisions rendered in all cases as they arise.

It becomes, in this view of the authority of the tribunal to fix not only the general scope of evidence and argument it will entertain in the discussion both of the merits of each claim and of the claimant's American citizenship, but to pass as well upon every offer of evidence bearing upon either issue that may be made before it, entirely unnecessary, and therefore entirely unsuitable, for me to enter upon any discussion of either the jurisprudence that should govern the decisions of the tribunal or of the reach of the jurisdiction accorded by the convention of 1871. All these topics are to be judicially treated and judicially decided by the tribunal, and the two governments are to accept the "awards made in the several cases submitted to the said arbitration as final and conclusive, and will give full effect to the same," as expressed in the seventh article of the convention.

This obligation upon the two governments is not at all dependent upon the methods, the rules, the reasons, or the law which have produced the awards, being approved by the governments, or the awards themselves being satisfactory to the governments. Any such pretension, if tolerated, would subvert the convention and reserve for direct debate between the governments contentions which have been deliberately remitted to judicial treatment and decision.

The interruption of the due judicial course provided by the convention in all cases which should be submitted to the arbitrators, and in which there should arise "questions upon which they should be unable to agree," which has been produced by the action of the Spanish arbitrator, is, as it seems to me, justly complained of by the claimants whose litigations have thus been delayed. There would seem to be no doubt that, upon the necessary reason of the situation, as well as by the explicit provision of the convention, the only condition to the attaching of the umpire's jurisdiction "to decide" any question is the inability of the arbitrators to agree upon that question. The interposition, therefore, of any obstruction by either arbitrator to the umpire's disposition of any question upon which the two arbitrators disagree seems a frustration of the equal, impartial, comprehensive, and efficient provision made for the umpirage to produce, in every possible case, an award which the disagreement of the arbitrators had disabled them from making.

This Government has every desire that the labors of the commission should be brought to a conclusion as rapidly as is consistent with an adequate consideration by the tribunal of the cases that may be submitted to it. It sees no reason to think that the purposes of the two governments have not been circumspcctly stated and their execution adequately secured by the convention of 1871; and, with every wish to meet any suggestion which may be made to it by the Spanish Government tending to a better or more acceptable observance of the terms or the spirit of that convention, it can not look with any complacency upon any diminution of the independent judicial authority of the tribunal constituted by it, or any interruption of its regular administration of the jurisdiction assigned to it.

I sincerely hope that the views I have had the honor to submit to you may satisfy you that the contention

on the citizenship of the claimants, dependent upon naturalization, is as fully a question of judicial determination for the tribunal in respect to the admissibility of evidence, its relevancy and its weight, and in respect to the rules of jurisprudence by which it is to be determined, as any other question in controversy in the cases. This contention was so dealt with by the arbitrators and by the umpire in the case of Dominguez, and doubtless in all other cases heretofore decided; and it will be so dealt with, I must assume, in all cases before the tribunal which involve that issue.

The conclusions which I have formed upon this subject result in the expectation that the rights secured by the convention to claimants whose cases have been laid before the tribunal by this Government will no longer be delayed or interrupted in their presentation by the obstruction interposed by the Spanish arbitrator to their due course of consideration and determination as prescribed by the convention.

A law of the United States makes it a criminal offense, punishable by both fine and imprisonment, for any person knowingly to use, in any way or for any purpose, a certificate of naturalization by fraud or false evidence. Any offender is liable to indictment, and on the trial it would seem that the court has express authority to go behind the certificate and to make the fullest inquiries into the facts and merits of the matter. This law is found in section 5428 of the Revised Statutes of the United States, which reads as follows:

Every person who knowingly uses any certificate of naturalization heretofore granted by any court, or hereafter granted, which has been or may be procured through fraud or by false evidence, or has been or may be issued by the clerk or any other officer of the court, without any appearance and hearing of the applicant in court, and without lawful authority; and every person who falsely represents himself to be a citizen of the United States, without having been duly admitted to citizenship, for any fraudulent purpose whatever, shall be punishable by a fine of not more than one thousand dollars, or be imprisoned not more than two years, or both.

It would seem that any person knowingly using a fraudulent naturalization certificate before an international arbitration commission holding its sessions in this country would be liable to the penalties of the above statute.

In his message of 1875, President Grant said: "On many occasions it has been brought to the knowledge of the Government that certificates of naturalization are held and protection or interference claimed by parties who admit that not only they were not within the United States at the time of the pretended naturalization, but that they have never resided in the United States. In others the certificate and record of the court show on their face that the person claiming to be naturalized had not resided the required time in the United States. In others it is admitted upon examination that the requirements of law have not been complied with. In some cases, even, such certificates have been matter of purchase. These are not isolated cases arising at rare intervals, but of common occurrence, and which are reported from all quarters of the globe."

NAVY OF THE UNITED STATES. This important arm of the national service excited public attention to a large extent in 1881. For several years the navy had been much neglected. It had become weak and inefficient. It was poorly and meanly supplied; and it was held to be quite unworthy of a great nation. The Secretary, in his annual report, urged warmly its claims upon the gratitude of the country, and pleaded earnestly for prompt and efficient action in its behalf. He is clearly of opinion that, "while the navy should not be large, it should at all times afford a nucleus for its enlargement upon an emergency. Its power of prompt and extended expansion should be established." And he further says: "Upon the whole, whether it be as a means of self-protection to the long line of cities and harbors upon our coasts, or to guard our commerce on the high seas, or to insure our citizens sojourning in foreign lands and their property and persons against outrage; or to take and keep our proper place among nations; or to maintain the sentiment of patriotism connected with our navy, and with the memory of its departed heroes; or to reap the advantages of the researches and labors of its officers in the further progress of advanced science, it becomes the duty of Congress to see to it that the navy of the United States should not be left to perish through inanition, but should be restored to a condition of usefulness, in which it may, upon occasion, be so expanded as to become the ready means of protection at home, or of active and aggressive warfare in the ports and waters of an enemy."

In order to be able to come before the national legislature with some definite, matured plans and recommendations for increasing the efficiency of the navy, a naval advisory board, consisting of able and experienced officers, was appointed early in the year. It prosecuted its work and reported toward the close of 1881. It strongly recommends proper and effective vessels, combining sufficient speed, facility of manœuvre, and a power of resistance deemed abundantly available for practical purposes. These vessels thus recommended are adapted to the depth of water in our ports and harbors; and, while requiring no fine work, extravagant and useless, it is believed they will adequately supply the pressing wants of this arm of defense. The number and types of vessels that will be available for service in the navy at the expiration of eight years, in case the programme set forth by the advisory board be adopted, are: twenty-one ironclads ("such vessels," they emphatically declare, "are *absolutely needed for the defense of the country in time of war*"), seventy unarmored cruisers, five rams, five torpedo gunboats, twenty torpedo-boats. Cost of the vessels recommended to be built, nearly \$30,000,000.

At this date there are one hundred and forty vessels on the navy list, twenty-five of which are mere tugs, with a very large number of

others entirely useless, and which could not, without a great expenditure of money, be made fit for service. There are, it appears, four double-turreted monitors belonging to the Government and remaining unfinished, one at Philadelphia, one at Wilmington, Delaware, one at Chester, Pennsylvania, and one at Mare Island, California. It is not clear what is best to be done with these, whether to continue work on them or to abandon them. It is recommended that they be removed to a navy-yard, be carefully examined, and, if thought advisable, finished in a manner to confer some benefit on the Government, in spite of their irregularly designed plans. At present these monitors are only bad copies of old models built in an emergency, worthless for the defense of the coasts, and entailing considerable expense for their preservation. The Government can not afford to throw away these vessels, after spending so much money on them, without first finding out whether they may be converted into useful ships.

The United States maintains squadrons, of some five or six vessels each, on the North Atlantic Station, the South Atlantic Station, the European Station, the Pacific Station, and the Atlantic Station. Besides these there is a training-practice squadron, consisting of five vessels; seven ships are employed on special service, and one is used by the State of New York as a marine school-ship.

During 1881 a portion of the navy was occupied in works of utility to the country at large, as well as in the interests of science. The longitudes of Yokohama, Nagasaki, Vladivostok, Shanghai, Amoy, and Hong-Kong have been established by means of the electric telegraph, and it is expected that the electric light will be found of great value for various purposes in the naval service. Two United States steamers have been detailed for the purpose of surveying the waters and shoals of the Gulf of Samana, in the Island of San Domingo, which, from its geographical position and extent, seems destined to become of great importance commercially, and for similar service on the Spanish Main. It is recommended that systematic surveys be made of parts of the West Indies, the coasts of Mexico and Central America, and of the Marshall and Caroline groups of islands. The Naval Observatory reports astronomical work performed during the year, consisting of observations of stars, satellites, and comets; their reduction and partial publication; the discussion and publication of the result of the transit-of-Venus expeditions of 1874; the reduction of the photographic observations of the transit of Mercury of 1878; and the prosecution of experiments on astronomical photography. In this connection, mention is made of the selection and purchase of a site for a new Naval Observatory on Georgetown Heights. It is estimated that the cost of the new structure will be about \$600,000. Under authorization of Congress, the Secretary of the Navy had a

vessel of suitable size and equipments fitted up to search for the steamer *Jeannette*, of the Arctic Exploring Expedition. A Government steamer was also sent to aid in the same benevolent undertaking, for the particulars of which see "GEOGRAPHICAL EXPLORATIONS." The first vessel remains over, to continue the search in the summer of 1882. The United States steamer, being wholly unsuccessful in the main object of her cruise, returned to New York in November.

The Bureau of Ordnance reports that, besides its usual work of fitting batteries of ships for sea, and keeping up the stock of manufactured articles for current service, it has been engaged in improving the ballistic power of certain of the Parrott muzzle-loading rifles by converting them to breech-loaders with enlarged powder-chambers. An earnest remonstrance is made on the subject of modern rifled breech-loading cannon, a matter which has frequently been brought to the attention of Congress. "Our vessels of war are obliged to appear to great disadvantage beside those of ostensibly equal force belonging to other nations, and our battery power is so low as to justify the gravest apprehension in case we should be called upon to meet foreign ships of equal size in battle." As there seems to be an impression prevailing in some quarters that torpedoes alone would suffice for the defense of the coast against a hostile fleet, care is taken to dispel this impression, and it is affirmed positively that "torpedoes, either for defense or attack, must be covered or defended by the fire of powerful rifled guns, both afloat and ashore. The two destructive agents (artillery and torpedoes) supplement each other, and, as a rule, must be employed together."

The appropriations available for the current expenses of the year ending June 30, 1881, were \$15,035,752.45, to which should be added \$59,309 transferred from the navy pension fund to the Naval Asylum. There should also be added \$185,443.31, appropriated to cover deficiencies for 1881, making a total of \$15,280,504.76. There was also a balance on hand at the beginning of the year, under the appropriations for pay of the navy and pay of marine corps, of \$1,495,313.35. From this sum should be deducted \$673,163.46, amounts due from said appropriations to "general account of advances," and also \$3,565.68 carried to the surplus fund; also the sum of \$19,458.94 appropriated for charts of the Amazon and Madeira Rivers, etc., transferred from appropriations made for that year and carried to the account for indefinite appropriations. The net amount available for the year was \$16,020,301.03. The expenditures were \$14,450,789.86, leaving a balance of \$1,569,511.17. To this should be added unexpended balances in the hands of pay-officers, \$692,987.74, which shows that the net expenditures for the fiscal year were \$2,262,498.91 less than the amount applicable therefor. The amount of appropriations available for the fiscal year (ending June 30, 1882)

is \$14,874,269.55; also transferred from navy pension fund to the Naval Asylum, \$59,813, making a total of \$14,934,082.55. The number of navy invalids, navy widows, and others is 4,195; the amount paid for pensions is \$965,138.24.

The Naval Academy appears to be in excellent condition. It is regarded as a source of pride to the department, and of usefulness to the country. It is believed that the Academy is, in all respects, at this time superior to any other naval school in the world. This excellence arises from the system of instruction originally introduced at the first formation of the school, and since then perfected by such reforms and improvements in its curriculum and general management and discipline as have become necessary in the course of time. The interest and zeal which have been exhibited by the corps of officers and instructors in charge of the Academy are entitled to commendation. In this connection it may be noted that the training-ships for the purpose of training boys to become seamen have proved very effective, and, for the first time in our history, the naval apprentice system seems to be established on a sure foundation, from which the navy will soon reap material advantages. It is confidently believed that this training squadron will maintain its present efficiency, and may be relied on in future to furnish a nucleus for seamen for the navy.

There are in the navy-yards large accumulations of property, consisting of the ancient hulls of vessels of war, launches and other ships' boats, old machinery and condemned stores and materials, and other effects, which have become unfitted for use in the navy.

The career of the celebrated United States frigate *Constitution*, commonly known as "Old Ironsides," so renowned in song and story, is ended at last. December 15, 1881, she was formally put out of commission at the Brooklyn Navy-Yard, her ensign being hauled down in the presence of Admiral Cooper and the other officers attached to the station. Since then the *Constitution* has been stripped of her spars and guns and has taken her place in what is called "Rotten Row," with the *Susquehanna* and *Ticonderoga*, and unless broken up will be allowed to fall gradually to pieces. Once before it was determined to put "Old Ironsides" out of commission, but the lines of one of our poets—

"Ay, tear her tattered ensign down!"—

saved the frigate, and prolonged her career for two score years. The keel of the *Constitution* was laid in Boston, Massachusetts, November, 1795, and she was launched in October, 1797. Her first cruise was made in the summer of 1798, and her first commander was Captain Samuel Nicholson. Her last voyage was made in November, 1881, and her last captain was Commander E. M. Shepard. In 1804 the *Constitution*, under Preble, silenced the land batter-

ies at Tripoli, and gained the freedom of three hundred American captives. During the second war with Great Britain—1812-'15—she made her famous record, beginning with her escape, while under the command of Commodore Isaac Hull, from a British squadron off Sandy Hook, in July, 1812. Under the same gallant officer, the victory over the *Guerriere* was gained on August 19th of the same year. December 18th, the British frigate *Java* was captured, and in the following year the sloop-of-war *Pictou*, a privateer, and several English merchantmen were her spoils, while early in 1815 the frigate *Cyane* and the sloop-of-war *Levant* were made prizes. Since that war the *Constitution* has been rebuilt and several times repaired. Her flag has floated on every sea, and in a single cruise in the Pacific the old frigate sailed 52,379 miles. She has always been a singularly lucky ship, and in her long career of nearly a century her good fortune was ever remarkable. To enumerate her commanders would be to name nearly all the heroic names in our early naval annals. Preble, Rodgers, Chauncey, Hull, Decatur, Bainbridge, Porter, and Charles Stewart, are among the American commanders who won renown in her. Her last foreign service was a peaceful one—carrying American products to and from the Paris Exposition of 1878. Since her return from Europe, the *Constitution* has been used as a training-ship for boys.

NEBRASKA. The Sixteenth Legislature of this State convened at Lincoln, and began its biennial session of 1881 on the 4th of January, J. B. Dinsmore having been elected President *pro tempore* of the Senate, and H. H. Shedd Speaker of the House of Representatives. Both of these presiding officers belong, politically, to the Republican party; about three fourths of the whole legislative body of Nebraska consisting of Republican members. The vote for Speaker in the Lower House stood: Shedd, 74; J. Holman, his competitor, 8.

On the 5th of January the re-elected Governor, Albinus Nance, was duly inaugurated.

Among the first business of the session was the election of a United States Senator to occupy the seat of Mr. Paddock, whose term was to expire on the 3d of March ensuing. The competitors for that office were numerous, and each of them was supported by not a few members. At the end the choice was between Mr. Paddock for re-election, and Charles H. Van Wick, a comparatively new resident of Nebraska, formerly a citizen of the State of New York, and also one of her Representatives in the Lower House of Congress. By the ballot taken in either House on the 18th of January, Mr. Paddock received more votes than were given to any of his competitors, but no election was effected. The seventeenth ballot, taken at the convention of the 22d of January, decided the contest in favor of the new resident, the votes having been—Paddock 36, Van Wick 68, or nine more than the required majority.

The satisfactory condition of the State's finances, and her educational and material interests, was laid before the reader of the "Cyclopædia" in 1880. The progress which Nebraska has recently made, and her prospective further advance, were summed up by the Governor at the conclusion of his message in these words:

At the close of my first official term I review with satisfaction the progress of the State in the development of its varied resources. Railroads have been rapidly extended toward the frontier, affording additional transportation facilities for new settlements; an immense area of wild land has been brought into a state of cultivation; manufacturing interests are utilizing the water-power afforded by our rivers and smaller streams; enterprising capitalists are developing the coal-fields that are believed to be abundant within the borders of the State, and there are many reasons for anticipating greater prosperity in the not distant future.

The fact that the rate of taxation for general purposes, which the law of 1879 fixed at two mills on the dollar, was totally inadequate to meet the general expenses of the State government for the next fiscal term, led to the passage at this session of an act which fixed the general State tax at five mills on the dollar, and the sinking-fund tax at three fourths of one mill. The rate of the last-named tax for 1879 and 1880 was five eighths of one mill; the aggregate amounts of taxable property in Nebraska, as assessed in the said two years, having been \$75,359,798.87 and \$90,499,618 respectively.

The remarkable growth of the State in population during the last decade—from 122,993 in 1870 to 452,542 in 1880—entitles her to three Representatives in the Lower House of Congress instead of one, as heretofore. A bill to district the State was introduced in the Senate and passed, but was defeated in the Lower House on the last day of the session. Nebraska must thus elect all of her three Representatives in Congress from the State at large, until a future General Assembly divides her territory into districts, or hold a special session of the Legislature. A provision of the State Constitution required the Legislature at this session to re-district the State for representation in the General Assembly, and to determine the number of members that shall constitute each of its two Houses. An act was therefore passed apportioning the State into thirty-one senatorial and fifty-nine representative districts, and defining their respective limits. The act assigns one member to every senatorial district, except the seventh and sixteenth, which may elect two Senators each, and from one to eight members to every representative district, in proportion to its extent and population. In consequence of this apportionment, the members of the next Legislature will be numerically increased—in the Senate from 30 to 33, and in the House of Representatives from 84 to 98.

The State Constitution also authorizes the Legislature, "in and after the year 1880, to increase the number of judges of the district courts and the judicial districts of the State."

The rapid increase of population, and the consequent accumulation of business in the district courts, seemed to make it necessary to exercise this power. Several bills in both Senate and House of Representatives were therefore introduced under different titles, but all purporting to increase the number of judicial districts, and provide judges and other officers for their courts; even one with the definite object of "dividing the State into six judicial districts" was presented; but no decisive action was taken on any of these bills.

In the absence of an organized militia, the Governor, as late as April, 1879, was not able to comply with a request made by the Sheriff of Adams County "for a company of troops for service at Hastings, to preserve peace and quiet during the Olive trial"; but a request for United States soldiers was made, and they were ordered by General Crook to perform that duty. Subsequently twelve companies of infantry, with one of light artillery, consisting of 598 officers and men, were fully uniformed at their own expense. Upon the occasion of the labor troubles at Omaha in May, 1880, four companies of this force rendered most valuable service. The Legislature has since passed an act "To establish a military code for the State of Nebraska." The act also organizes a body of State militia. Its main provisions are, that every male citizen between eighteen and forty-five years of age, able-bodied, and not otherwise exempt by law, is subject to military duty; and that the active militia force, which is to be styled "The Nebraska National Guard," shall consist of two thousand men, recruited for three years by volunteering, and distributed into four regiments.

The usually short session of the Nebraska Legislature was closed in 1881 on February 26th; the bills and joint resolutions passed in it amounted to 86. The aggregate number of those introduced and filed in either House during this session was 454—136 in the Senate and 318 in the House of Representatives. Among the acts passed, besides those above mentioned, was one "proposing an amendment to section 1, Article VII, of the State Constitution." Its object is to give women the right to vote at political elections. Both the amendment, and the manner of submitting it to the popular vote for adoption or rejection, are expressed in the act as follows:

SECTION 1. Every person of the age of twenty-one years, and upward, shall be an elector. First, citizens of the United States; aliens naturalized thirty days prior to election.

SEC. 2. The ballots at the election at which said amendment shall be submitted shall be in the following form: "For proposed amendment to the Constitution relating to rights of suffrage." "Against the proposed amendment to the Constitution relating to rights of suffrage."

A new school law, repealing or remodeling the whole system of public instruction, and all amendatory acts heretofore in force in the State, was adopted. The act provides for all the departments of the system in detail, being

distributed into fourteen subdivisions, and each of these into a number of sections. The common-school course is to comprise orthography, physiology, arithmetic, English grammar, and English composition. School-books are to be adopted by the Board of Trustees; and the annual school-meetings are to be held on the first Monday in April, women being allowed to vote in them, provided they own personal property assessed, or have children of school age.

A new mechanics' lien law, repealing or amending the one heretofore in force, was enacted as follows:

SECTION 1. Any persons who shall perform any labor or furnish any material or machinery or fixtures for the erection, repair, or removal of any house, mill, manufactory or building, or appurtenance, by virtue of a contract or agreement expressed or implied, with the owner thereof or his agents, shall have a lien to secure the payment of the same, upon such house, mill, manufactory, building, or appurtenance, and the lot of land upon which the same shall stand. Such lien shall be preferred to all other liens or incumbrances which may attach to, or upon, such lands, buildings, or improvements subsequent to the commencement of such buildings, the furnishing or putting up of such machinery, or the making of such repairs.

Another act to secure the payment of labor performed or materials furnished for "railroad, canal, bridge, and ditching companies, and persons," was passed. A general railroad law was also adopted, "to fix a maximum standard of freight charges on railroads, and to prevent discrimination therein, or secret rates, rebates, or drawbacks therefor." It provides for uniform rates, as follows:

SECTION 2. No company shall hereafter charge, collect, or receive for transportation of merchandise or other property upon said road a higher rate for such services than was charged by said road for like services in November, 1880; shall not allow drawback or rebate whatever. A violation of this act shall be liable to all damage sustained by such violation, and liable to a fine of \$500, to be recovered in the name of the individual injured, and no railroad company shall demand, charge, collect, or receive for such transportation for any specific distance, a greater sum than it demands, charges, collects, or receives for a greater distance."

A memorial to Congress was also passed relative to unjust discriminations and excessive freight-rates charged by railroad companies, with a joint resolution requesting the Nebraska Representatives in Congress to favor Federal legislation "to correct the said abuses of railroads."

An act "to prevent treating in saloons, and other public places," was also passed, which makes both treater and treatee guilty of a misdemeanor, and imposes on each of them a fine of \$10, or imprisonment in jail, or both. They shall also pay to the court \$16 for the prosecuting attorney. If no attorney is employed, this money is to be paid to the school fund.

An enlargement of the Capitol is under construction, and provision has been made for the erection of a building for the deaf and dumb, and to establish a Home for the Friendless.

In the following table is given the population of the State by counties in 1880 and 1870:

NETHERLANDS, THE, a kingdom of Europe. King, William III, born February 19, 1817; succeeded his father March 17, 1849. He was married first to Sophie, daughter of King William I of Wurtemberg (died June 3, 1877), and secondly to Emma, Princess of Waldeck-Pyrmont. He has one son, Alexander,

Prince of Orange, born August 25, 1851; and one daughter, Wilhelmine, born August 31, 1880. The area of the several provinces of the kingdom, and the population, according to the census of December 31, 1879, and according to an official estimate of December 31, 1880, are as follows:

PROVINCES.	Square kilometres.	POPULATION ON DECEMBER 31, 1879.			Population on December 31, 1880.
		Male.	Female.	Total.	
North Holland.....	2,770	328,638	351,302	679,990	694,166

Total.....	33,000	1,983,164	2,029,529	4,012,693	4,060,580

The total population, according to the census of 1879, was divided as follows among the different religious denominations:

Protestants.....	2,469,514
Catholics.....	1,489,137
Jews.....	81,693
Others.....	22,049

The birthplace of the inhabitants, according to the census of 1879, was as follows:

Netherlands.....	3,986,118
Dutch colonies.....	7,604
Germany.....	42,026
Belgium.....	18,816
Great Britain.....	1,614
Other countries.....	5,820
Unknown.....	1,195
Total.....	4,012,693

The population of the principal cities at the close of 1880 was as follows:

Amsterdam.....	826,196
Rotterdam.....	152,517
The Hague.....	117,856
Utrecht.....	69,221
Groningen.....	47,160
Arnhem.....	41,793
Leyden.....	41,241
Haarlem.....	38,152

The movement of population in 1880 was as follows:

Marriages.....	30,849
Births (inclusive of still-births.).....	151,380
Deaths.....	102,806
Still-births.....	7,525
Surplus of births.....	48,574

In the budget for 1881 the expenditures and revenues are estimated as follows (in Dutch florins):

EXPENDITURES.	
1. Royal house.....	750,000
2. Cabinet, supreme state authorities.....	618,513
3. Ministry of Foreign Affairs.....	660,399
4. " of Justice.....	4,591,879
5. " of the Interior.....	10,180,735
6. " of the Navy.....	12,124,440
7. " of War.....	20,992,500
8. Public debt.....	28,167,812
9. Ministry of Finance and Worship.....	18,687,820
10. Colonies.....	1,371,736
11. Public Works, Commerce, and Industry.....	26,271,296
12. Unforeseen.....	50,000
Total.....	124,466,985

REVENUE.	
1. Direct taxes.....	24,755,135
Land-tax.....	10,780,785
Poll-tax.....	10,032,000
Patent-tax.....	8,942,400
2. Excises.....	38,925,000
On spirits.....	22,400,000
On other liquors.....	16,525,000
3. Taxes on stamps, registration, and inheritance.....	23,460,000
4. Customs.....	4,611,040
5. Taxes on gold and silver ware.....	301,100
6. Public domains.....	1,550,000
7. Posts.....	4,000,000
8. Telegraphs.....	935,800
9. Lottery.....	430,000
10. Taxes on game and fishery.....	149,000
11. Pilotages.....	924,000
12. Taxes on mines.....	2,875
13. State railroads.....	2,200,000
14. Miscellaneous.....	2,866,605
Total.....	105,110,605

The financial estimates are always framed with great moderation, mostly exhibiting a deficit, which in the final account becomes a surplus. The public debt in 1881 amounted to 942,271,250 florins, divided as follows:

DIVISION OF DEBT.	Capital.	Interest.
1. Debt bearing interest at 2½ per cent.....	613,291,400	15,382,285
2. Debt bearing interest at 3 per cent.....	90,312,250	2,709,367
3. Debt bearing interest at 3½ per cent.....	10,392,000	366,345
4. Debt bearing interest at 4 per cent.....	184,357,000	7,375,430
5. Bonds bearing 4 per cent interest, issued in accordance with law of June 5, 1878.....	33,833,600	1,859,844
6. Miscellaneous, rentes, etc.....	55,391
7. Paper money, bearing no interest.....	10,000,000
8. Amortization.....	963,100
Total, 1881.....	942,271,250	28,167,812
Total, 1880.....	943,215,692	27,956,667

The army in 1881 consisted of 2,334 officers and 62,779 men. The navy, on January 1, 1881, comprised 103 steamers, with 389 guns, 17 sailing-vessels, with 153 guns, and 2 school-ships, with 8 guns.

The aggregate length of railroads in operation on January 1, 1881, was 1,901 kilometres, of which 1,009 kilometres were government roads.

The aggregate length of the state telegraph lines, on January 1, 1881, was 3,821 kilometres; aggregate length of wires, 13,817 kilometres; number of offices, 396; number of telegrams carried in 1880, 3,109,230.

The number of post-offices in 1880 was 1,316; the number of inland letters was 42,555,184; of foreign letters, 13,172,088; of postal-cards, 15,814,191; of newspapers, etc., 37,085,896.

The imports and exports in 1879 were as follows (in florins):

COUNTRIES.	Imports.	Exports.
Great Britain.....	219,008,000	129,081,000
German Customs Union.....	207,518,000	259,848,000
Hanse towns.....	18,245,000	10,487,000
Austro-Hungary.....	2,046,000	4,000
Belgium.....	111,857,000	94,253,000
Russia.....	82,901,000	7,562,000
Denmark.....	488,000	1,955,000
Sweden and Norway.....	9,816,000	4,728,000
France.....	16,950,000	10,849,000
Italy.....	2,301,000	4,110,000
Spain.....	7,946,000	1,224,000
Portugal.....	1,178,000	1,888,000
Other countries.....	6,985,000	1,814,000
1. EUROPE.....	632,294,000	526,253,000
United States.....	54,279,000	9,129,000
Cuba and Porto Rico.....	3,419,000	754,000
Brazil.....	1,291,000	743,000
States on the La Plata.....	866,000	141,000
Peru.....	7,784,000
Other American countries.....	2,017,000	1,217,000
2. AMERICA.....	63,606,000	11,984,000
British East Indies.....	29,889,000	844,000
China.....	36,000	251,000
Japan.....	1,790,000	5,000
3. ASIA.....	31,715,000	600,000
4. AFRICA.....	5,073,000	1,217,000
5. OTHER COUNTRIES.....	914,000	1,000
Total foreign countries.....	789,542,000	540,055,000
Java.....	55,994,000	41,485,000
Dutch West Indies.....	1,117,000	120,000
Total Dutch colonies.....	57,111,000	41,605,000
Total.....	846,653,000	581,660,000

The colonies of the Netherlands are considerably larger and more populous than the mother-country itself. In the East Indies, Java and Madura have an area of 131,738 square kilometres, and a population of 19,068,600. The aggregate area of the other colonies amounts to 1,700,000 square kilometres; their native population is not accurately known, but is estimated at about 7,800,000. The foreign population was as follows:

Europeans, civilians.....	88,026
Europeans, army.....	11,730
Europeans, navy.....	8,161
Chinese.....	819,887
Arabs.....	14,318
Hindoos.....	18,265

The capital, Batavia, has a population of 97,585; Samarang, 79,443; and Soerabaya, 118,824.

In America, the colony of Surinam or Dutch Guiana had, in 1879, an area of 119,321 square kilometres, with a population of 68,507; Curaçoa, in the West Indies, had 1,130 square kilometres, with 42,447 inhabitants.

The budget estimates of the Dutch colonies, for the year 1881, were as follows (in florins):

COLONIES.	Revenue.	Expenditure.	Deficit.
East Indies.....	142,602,554	144,671,160	2,068,606
Surinam.....	1,134,443	1,380,090	195,647
Curaçoa.....	395,091	572,222	177,131

The commerce of the East Indian colonies, in 1878, was as follows: imports, 140,450,000 florins; exports, 179,967,000 florins.

The revenues have improved of late years, but the process of extending the railroad system and acquiring the canals as state property entails considerable deficits in the annual budgets, and the consequent augmentation of the public debt. There remained from the revenues of the fiscal years 1874 and 1875 surpluses amounting to 6,093,607 guilders, and from 1876 to 1879 deficits amounting to 31,804,999 guilders. The remainder of the loan of 1878, of which 26,652,177 guilders was left, more than covered the resulting deficiency. In 1880 a surplus of 2,205,001 guilders was left over. The estimated amount of the revenue of 1881 was 108,650,000, and the estimated expenditures 126,150,000, leaving a deficit of 17,500,000 guilders for the year, and, deducting the disposable surplus, a resulting deficiency of 13,500,000 guilders. The estimates for 1882 were for 106,664,559 guilders of revenue and 128,695,940 guilders of expenditures, leaving an estimated deficit of 22,000,000, of which 14,000,000 guilders represented railroad construction, 1,226,000 guilders the improvement of the canal from Rotterdam to the North Sea, and 1,937,000 guilders expenditure on fortifications. The project of the construction of a canal to the Rhine would require the expenditure of 12,250,000 guilders, that of improving the Rotterdam and North Sea Canal 26,274,000, and the extension of the railroad net-work 14,000,000 guilders additional. The expenditure for such public works would require 127,400,000 guilders to be raised in a few years, and a new loan to cover this expenditure is proposed.

The estimate of the colonial revenue for 1881-'82 was 138,913,703 guilders; the estimated expenditure was 148,499,631 guilders. The improvement in the revenue, owing to the higher price of tin, does not prevent a large deficit occurring, to cover which, and the unliquidated liabilities of former years, a loan will be raised; and meanwhile the Treasury advances the sum of 25,000,000 guilders to clear off these floating liabilities, which is to be repaid out of the proceeds of the loan. The States-General also agreed to the proposal of the Colonial Minister, Van Goltstein, to abolish the *corvée* in the East Indies, and substitute a poll-tax of one guilder for the forced labor. The operation of the laws regulating the importation of opium into the colonies was made the subject of a parliamentary investigation. The privilege of selling the drug is farmed out, and the license fees have been gradually raised to a very high sum. It seems that the Government has overshot the mark, and caused a heavy contraband trade to spring up, with the consequence that the price of opium has gone down at the same time that the licenses have been augmented. The budget, which was voted in November, in-

cludes appropriations for the improvement of the Soerabaya Harbor and the excavation of a new outlet for the Solo River.

A conference for the regulation of the North Sea fisheries was held at the Hague in October, which framed a treaty to be concluded between Holland, England, Belgium, Germany, Denmark, Sweden, Norway, and France, which embodied the propositions brought forward by the British representatives. Vessels engaged in fishery are to be registered and numbered, and must present their papers to the captains of cruisers which will patrol the seas. These captains are empowered to settle all disputes which shall arise between fishermen on the sea.

General van der Heyden, who had brought the war in Acheen to a termination at last, received great honors on his return to Holland. Great Acheen was placed under a civil government, but the sequels of the outbreak still kept the country disturbed. Some of the chiefs had not made their submission, and during the entire year marauders plundered the settlements, without the military and police being able to prevent them. The royal decree for the replacement of the military dictatorship by a civil administration was issued in October, 1879, but the time of its execution was left to the discretion of the Governor-General in Batavia. The war in Acheen was carried on with great losses in men and treasure, and with varying fortune, from 1873 to 1877, under Generals Koehler, Van Swieten, Pel, Wiggers, Van Kerehem, and Diemont. With the exception of Pel, who died prematurely, none of these commanders gained any decided successes. In the beginning of 1877, Colonel (afterward Lieutenant-General) van der Heyden was given the command, after a visit of the Governor-General van Lansberghe. The ability and energy of the new commander soon changed the situation, and after two of the most brilliant campaigns ever fought by the Dutch in the East Indies, he could report the war ended. The obstinacy of the resistance offered by the Acheenese was such that over 60,000 Dutch soldiers met their death in the field or in the hospital. The heaviest losses were when Koehler and Van Swieten commanded, while under Van der Heyden they were insignificant. The victorious general remained in the country, which he ruled with wisdom as a kind of military dictator. His kindly and judicious government won the reverence and gratitude of the natives, to whose race he himself partly belonged, being born of a Malay mother. The land was beginning to flourish, although the cost of the administration could not yet be supported by the people themselves. Nevertheless, there were many protests raised in the Netherlands against the long-continued military rule. Pruys van der Hoeven went out in the beginning of 1880, to take over the direction of affairs and establish civil government, but the universal protests

raised by all classes of the population made a change in the plan desirable, so that it was given out that the civil official had come to introduce certain reforms in co-operation with Van der Heyden. At length the progress toward order and prosperity was so manifest, and the outside pressure so strong, that the military governor was relieved, and Pruys van der Hoeven assumed the full authority in March, 1881. The new administration was no sooner set up, than tumults and aggressions broke out afresh.

The documents relating to the rebellion in Acheen, which the Government finally communicated to the Chamber, after repeated refusals, contained evidence showing that the scheming of the American and Italian consuls at Singapore was the original cause of the costly military expedition in Acheen.

The evil consequences of the silver crisis are felt keenly in Holland, which is the only country in Europe that has clung to the single silver standard—a standard originally adopted to secure its financial system from the shocks of monetary crises and disturbances in London. The Government continues to work in a diplomatic way for the conclusion of an international agreement to preserve the double standard. In the fourteen months ending with October, 1881, the Netherlands Bank lost, through the drain to America, not only all its gold bullion, but 21,950,240 guilders in minted pieces besides. The Minister of Finance expressed a hope of a satisfactory conclusion to the deliberations of the next International Monetary Conference, which meets in April, 1882; otherwise the Government must choose between withdrawing from circulation and selling a large part of the heavy silver coins, or accepting a silver currency only, either of which results would be accompanied by serious inconveniences to the country.

The Transvaal rebellion excited the intensest sympathy in Holland. An address to the British Parliament, composed by Professor Hartung, received the signatures of all the principal citizens of every community, and was circulated in other cities of Europe and in the United States. There was even talk of enlisting a corps of volunteers in Holland for the war. The Netherlands Government, in December, 1880, interceded for the Transvaal Boers with the British Government, and received the reply that their representations would be considered, on the condition that no official pressure should be exerted.

The subject of the North Borneo Company, and the charter granted it by the British Parliament, was brought up in the Assembly, and Rochussen, who had lately exchanged the post of Ambassador at Berlin for the portfolio of the Exterior in the new Cabinet, explained that the British Government disclaimed the intention of asserting any political authority over the territory acquired by the company, which would be in contravention of a treaty

concluded with Holland in 1829, and the lands would continue, therefore, under the sovereignty of the Sultans of Brunai and Solok, from whom the company purchased its privileges.

A Government measure for tax reform was thrown out by the Chamber, and the Minister of Finance, in consequence, handed in his portfolio. The minister, Vissering, was a professor of political economy, and entered the Cabinet at its formation, on August 19, 1879. His defeated measure was a proposal for a two and a half per cent tax on dividends and coupons. The Chamber voted in favor of the tax, but amended the bill by exempting all dividends and interest which could be considered as mercantile capital, upon which the bill was withdrawn. The Prime Minister and the Minister for Foreign Affairs took charge of the Finance Department *ad interim* upon the acceptance of Minister Vissering's resignation in June. In September, the Prime Minister, Baron Lynden van Sanderburg, gave up the Ministry of the Exterior, in which he was followed by Rochussen, and became the regular Minister of Finance. It is the twenty-fifth time that the portfolio of the Exterior has changed hands since 1848. The new minister entered upon a diplomatic career in 1856 as *attaché* to the embassy in Berlin, and was Resident Minister at Copenhagen and at Stockholm from 1864 to 1869. In 1870 he went to Brussels as Minister Extraordinary and Plenipotentiary, and in 1871 to Berlin in the same capacity, in which post he remained until he was called into the Cabinet.

Since the days of Thorbecke the cohesion and discipline of the Liberal majority have been so lax, and the party so divided by personal rivalries and aversions, that the Clerical and Conservative opposition have exerted a greater influence over affairs than the Liberal party, which has been supported by a greatly preponderant majority of voters. The election laws of Holland give the electoral franchise to only a select portion of the people, and of that portion only a small fraction take enough interest in the political struggles to deposit their ballots. Usually there are not over 25,000 votes cast in the whole country. The extension of the franchise has been talked about by the Liberals for some time, and was in the programme of legislation for the session; but it would have been disadvantageous for the dominant party in the summer elections, and was for that practical reason deferred.

The general election took place on the 15th of June. The Chamber, before the election, was composed of 52 Liberals, 17 Ultramontanes, 12 of the Orthodox Evangelical party, called Anti-Revolutionists, and 5 Conservatives. One half the seats were contested, among them those of 29 Liberals. The Roman Catholics and Evangelicals joined efforts to oust the Liberals from power, and gained several seats, but not enough to give a majority

to the Conservative fractions united. The new Chamber was composed of 48 Liberals; 1 Savage, who, however, inclined more to the Left than to the Right; 5 Conservatives; 15 Anti-Revolutionists, and 17 Ultramontanes. The Left, therefore, exceeded the Conservative fractions combined, by 11 or 12 votes, having lost considerably in the elections. The opposition parties have devoted extraordinary efforts to the purpose of ousting the Liberals. The Catholic and the Orthodox parties struck up a temporary alliance for this object.

The new session of the Legislature began September 29th. One of the principal government measures was a new army law. The active militia is composed, in peace as well as war, of volunteers and drafted men. The term of service commences with the twenty-first year, and consists of one year's continuous service and periods of six weeks' attendance with the colors in the other four years. The privilege of appearing by substitute and of exchanging lots is retained, but substitutes must not be over thirty years of age. The maximum strength of the militia is raised from 55,000 to 62,400, and the annual recruits from 11,000 to 12,600. The National Guard, or reserve, embraces the entire male population capable of bearing arms between the ages of twenty and thirty. The "dormant" guard, which was subjected to no drill in time of peace, and was not armed, is abolished. The reserve is divided into two classes according to their efficiency, which are required to practice only from 40 to 50 and from 90 to 100 training-hours a year, respectively. The strength of the reserve corps is 142,000 in peace. The force which is estimated to be at any time fully trained and ready for mobilization is 81,000. In case of war the fully trained are to serve at once in garrison duty or in the field, while the others are to be instructed in training-camps in the interior of the country.

A copyright law was enacted, which fixes the term of property-rights in literary productions at fifty years from the time a copy of the publication is deposited with the Minister of Justice.

In connection with the adoption of a revised criminal code, a minority were in favor of the restoration of the death-penalty, which was abolished in 1870. The Minister of Justice stated that the convictions for crimes which merited death, according to the law in force up to that time, in the ten years immediately following the abolition of capital punishment, were 57 in number, while the number of those condemned to death in the ten years immediately preceding was 82. A comparison of the statistics of crime since 1811 showed that the graver offenses have diminished continuously.

The Government projects for the improvement of the canals from Rotterdam to the North Sea, and the construction of a new one from Amsterdam to the Merwede, connecting

that city circuitously with the Rhine, were carried through the Legislature; but the latter, before passing the Upper House, became the political question of the day. The people of Amsterdam desired a canal direct to the Rhine, and the municipality offered to contribute 3,000,000 guilders. The Minister of Public Works, Klerck, had threatened to resign if his scheme was rejected, so that the technical question of the practicability of the shorter route was complicated by the opportunity offered to give the ministry a set-back. The merchants of the capital were indignant at the rejection of their demand for a direct eastward connection with the Rhine.

The Minister of Justice, Moddermann, excited a commotion among his fellow-Liberals by an answer to an interpellation from the Clerical benches on the same question that was raised in England by Bradlaugh. It has been the custom for some time of the freethinking members to decline to take the parliamentary oath as being contrary to their religious principles, and they have been allowed instead to subscribe to the affirmation provided by statute. The minister delivered the opinion desired by the interrogators, to the effect that the affirmation can only be legally elected, instead of the oath, by members of those religious sects, like the Remonstrants, whose confessional principles are opposed to testifying by oath. The question was raised again from the Liberal side on the occasion of an atheist's having been excluded from one of the municipal councils on account of his declining to take the oath. The subject of the discussion was Dr. Hartog Heys van Zouteveen, of Assen. The Second Chamber rejected a resolution declaring it to be the sense of the Chamber that the right to affirm in taking a seat in municipal councils is a general one, and, by a majority of 62 to 16, adopted instead one proposed by a Catholic member, but approved by the minister, declaring a revision of the law of oaths to be necessary, and that the Chamber was prepared to limit the number of cases in which the oath is made obligatory. A new petition from the Evangelical opponents to secular education, that confessional schools might be re-established in place of the present state schools, was presented to the Government in October, and received the same negative answer which was given in 1878.

NEVADA. The material interests of Nevada, which were mentioned last year as having been depressed since 1878, have continued in that condition and manifested a downward rather than an upward tendency. To show the disproportion existing between the actual worth of property and the taxes yet levied on it, a leading local paper remarked, near the close of September: "Property in Virginia City and Gold Hill has depreciated alarmingly. The assessor has made his rounds, and many holders of real estate are now seriously debating in their own minds whether their posses-

sions are worth as much to them as the taxes which are to be exacted from them." The officers whose duty it is to inspect property and assign to it a value for taxation purposes have, of themselves, taken the present state of things into consideration, and in preparing their lists for 1881 generally assessed at a reduced valuation as compared with the assessments of previous years. The various mining companies in Storey County also severally applied to the Board of Equalization for a reduction of their assessments; and the representative of the Virginia and Truckee Railroad Company requested the board to reduce the assessment of that road in Storey County from \$16,000 to \$12,000 per mile on the main track, and from \$5,000 to \$4,000 on the side-track.

The Nevada mines yielded in 1881 several millions less than in the preceding year. The statement of the precious metals produced in the States and Territories west of the Missouri River during the year 1881 shows the yield from the Comstock to have been \$1,726,182, as against \$5,312,592 in 1880—a decrease of \$3,586,420; and the product of Eureka District is set down at \$4,127,265, as against \$4,639,025 in 1880—a decrease of \$511,760.

Active work in the mines, however, has been pursued in 1881 without abatement generally, and a large proportion of it was preparatory dead work of heavy expense, to serve as an opening for future operations, which are stated to afford a very promising prospect. The Consolidated Virginia, the California, and the Sierra Nevada, prominent among the numerous mines in the State, are now worked at the levels, the first-named one of 2,500 feet, the two others of 2,700 feet below the surface, and all of these depths were reached in 1881. In the annual reports of the superintendents of these three mines, giving an account of their operations, receipts, and expenses, they severally state that the work done in them from December 31, 1880, to December 31, 1881, "has been mostly of a preparatory nature," and a large amount of it "necessary dead work." As to means for "prosecuting their explorations in depth," all of the said mines are represented "to be now in a better condition than at any previous time." On this point the Superintendent of the Sierra Nevada concludes his report, saying: "At no time during the last two years have the prospects of the Sierra Nevada mine looked more promising than they do at the present time. . . . The mine is fully equipped with all necessary machinery for use under-ground and on the surface, which is now in first-class working order."

Respecting the location of "lodes," or "mining claims," and the time within which certain expenditures must be made on them to secure the possessor's title, local usages of doubtful origin and validity have been introduced in different mining districts, which the locator is required to comply with, or forfeit his claim. The Commissioner of the General Land-Office,

to whom inquiries on the subject were addressed, has given the subjoined important answer, saying:

In reply to your communication I have to state that the United States mining laws provide that the locator of a lode or mining claim must make the annual expenditures necessary for the maintenance of the possessory title at any time within one year from the 1st of January next succeeding to the date of location, and the miners of a mining district have no authority to make any rules conflicting with this law. If the mining laws of your district require that \$50 shall be expended within sixty days after the location, such provision is wholly without force. Suppose a location to have been made July 1, 1880, the \$100 worth of expenditure is required by the United States laws to be made between the 1st of January, 1881, and the 31st of December, 1881, and the expenditure made prior to this date, viz., within sixty days after the location, would not be in conformity with the provisions of this law.

In consequence of the law enacted by the Legislature at the session of 1881, uniting the two municipal governments of the city of Virginia and of the town of Gold Hill in Storey County into one government, under the administration of the commissioners of that county, the city of Virginia has ceased to exist as a separate corporate body, and her property, with the papers and effects belonging to all the departments of her government, has been formally transferred to the hands of the said board.

Other acts of a public character were passed at the same session, as follows: An act to re-apportion the State for representation in her Legislature. By the new apportionment the members of that body are numerically reduced from seventy-five to sixty—twenty Senators and forty Assemblymen—distributed among the fourteen counties of Nevada as senatorial and representative election districts. An act "to aid the Nevada Benevolent Association" was passed. It authorizes the said corporation to give public entertainments, not exceeding five in number, and to distribute among the holders of admission-tickets certain valuable articles enumerated in the act. This law, which was commonly termed "The Lottery Law," and much commented upon, has been declared to be unconstitutional and void by the State Supreme Court. The decision was rendered in a case brought before it by the Attorney-General for adjudication. It expresses the unanimous sentiment of all the three members of the court, and is of considerable length, being a full and exhaustive review of the laws of Nevada and of other States relative to lotteries, and minutely surveys the whole field of jurisprudence on that subject. "Lotteries," as coming under the prohibition of the organic law of Nevada, the decision defines to be "a game of hazard in which small sums are ventured for the chance of obtaining greater"; thus including within the signification of that word all schemes intended for the distribution of prizes by chance, even though every one of the ticket-holders should draw a prize. An act to establish a State Asylum for the Insane

was also passed; its object being to require the State to keep and care for persons belonging to that unfortunate class within her own borders, instead of sending them to a private medical establishment at Stockton, in California. The act designates Reno as the place in which the asylum shall be erected, and created a board of commissioners charged with the duty of carrying its provisions into effect. An act "to appropriate funds for the relief of the several orphan asylums of this State," appropriates \$11,000 to be paid "to institutions which would receive orphan children, regardless of creed or sect," and appointed a "Board of Examiners," to inspect all claims presented by orphan asylums for the payment of any portion of the appropriation. This law has given occasion to an investigation, first before the Board of Examiners and then before the State Supreme Court, in a case entitled "Nevada Orphan Asylum *vs.* J. F. Hallock, State Comptroller," upon a bill presented to the Examiners on June 6th, for the payment of \$1,279.79. This amount was claimed as due to the said asylum in accordance with the provisions of the above act, "for the care of sixty orphans and twenty-eight half-orphans during the quarter ended June 3, 1881." After some discussion on this claim, the board referred it to the Attorney-General for his opinion as to its validity; upon which that officer subsequently addressed to the board the following communication:

OFFICE ATTORNEY-GENERAL,
CARSON, June 30, 1881.

To the Honorable the Board of Examiners in and for the State of Nevada.

GENTLEMEN: I have had under consideration the claim of the Nevada Orphan Asylum of Virginia, Nevada, referred to this office at your meeting, held June 6th, and beg leave to report as follows:

I am informed that the Trustees of the Nevada Orphan Asylum, of Virginia City, Nevada, do receive into their institution and provide for orphans and half-orphans, regardless of their creed or sect. I am also informed that all the orphans and other children received into said institution and instructed in the schools attached to the said Nevada Orphan Asylum were, and are, instructed in the religious sectarian tenets and doctrines taught in the Roman Catholic Church, and that they are required and compelled to attend and be present at prayers and religious services in that particular creed, and will not be permitted to attend any other place of worship; and, if such be the case, the said Orphan Asylum of Virginia City is not entitled to receive any sum or sums of money from the State Treasury, as applying any moneys for such purposes would be in violation of section 10 of Article XI of our Constitution. . . . I would therefore recommend that the board set apart a day in the near future, and send for persons and papers, and upon such investigation, if the Board of Examiners shall become satisfied that the said Nevada Orphan Asylum of Virginia be conducted upon sectarian principles, then the claim be rejected. But if orphans of all sects and creeds are received into said institution, and are not required to conform to the rules, regulations, and tenets of the Roman Catholic Church, they are entitled to have the claim allowed.

M. A. MURPHY, Attorney-General.

The Nevada Orphan Asylum in Virginia City is under the charge and management of the Sisters of Charity, who are Roman Catholics,

and the oral testimony, which was taken on November 29th, had for its object to ascertain whether the said institution is conducted in what is called a "sectarian" manner or not; the witnesses heard included the Mother Superior, who has had the asylum in charge from its first organization; the Sister who is, and has been for thirteen years, the secretary of the institution, and a school and music teacher in it; a Protestant female teacher in a public school of Virginia City for many years, who received her education at the asylum as a day-scholar for six years, and as a boarding-scholar for two years and a half more, during which thirty months she lived within the asylum building as her home; and two Protestant old residents of Virginia City who have sent their children to the asylum for their education, and left them living in it as boarding-scholars during four months and five years respectively. The answers given by these witnesses, the Attorney-General being one of the interrogators, established that the asylum received and cared for children of all creeds and sects; that Protestant children were "not required to conform to the rules, regulations, and tenets of the Roman Catholic Church," nor influenced in any way to become Catholics; but that they were left entirely free to follow and practice the doctrines of their own creeds.

A great addition to the wealth of Nevada is expected from working out the mica deposits existing in numerous sections of the State. From beds located in various parts of Eastern Nevada there have, in the course of the last five years, been taken specimens in sheets of considerable sizes, even as large as ten inches square.

A local railway has been built in Nevada during the year, connecting Bodie District with the timber-belt south of Mono Lake. It is a narrow-gauge road of thirty-one miles in length. For the first ten miles from Bodie the road is on a steep grade of two hundred feet to the mile, and the remaining twenty-one miles are on an arid alkali plain. The road is stated to have been built under very great difficulties, at a cost of about half a million dollars.

The following shows the population of Nevada by counties in 1880 and 1870:

COUNTIES.	1880.	1870.

NEW CHURCH, THE. The sixty-first General Convention of the New (Swedenborgian) Church met at Washington, D. C., May 20th. The Rev. Chauncey Giles presided. Delegates were present from the States of Massachusetts, New York, New Jersey, Pennsylvania, Delaware, Maryland, Michigan, Ohio, Indiana, Illinois, Georgia, Virginia, Wisconsin, and California, and from Canada. Statistical reports were presented from the associations as follows: Canada Association, 5 societies; Illinois Association, 450 members; Maine Association, 5 societies, 3 ministers, 330 members; Maryland Association; Massachusetts Association; Michigan Association; Minnesota Association; Missouri Association; New York Association, 8 ministers, 11 societies, 538 members; Ohio Association, 8 ministers, 3 licentiates, 11 societies, 557 members; Pennsylvania Association, 5 ministers, 7 societies, 357 members; societies at Denver, Col., New Orleans, La., Edenfield, Milwaukee, Wis., and San Francisco, Cal. A society in Savannah, Ga., applied for admission. The trustees of the Jungerich fund for promoting the distribution of the works of Swedenborg reported that after nine years of work in the distribution of the "True Christian Religion," and the "Apocalypse Revealed," in the course of which 20,500 copies of the former and 14,000 of the latter work had been sent out, the demand for the books continued steady. In all, 51,500 copies of Swedenborg's works had been distributed through this agency. The Board of Missions had received \$2,248, and had paid out \$1,882. The German Missionary Union, the object of which is to furnish German members of the New Church in the United States with books and tracts, had on hand the sum of \$749. It had provided a German liturgy and a singing-book for Sunday-schools, and had published a German edition of Tafel's "Authority in the New Church." The Theological School at Boston, Massachusetts, had been attended by six students. Instruction was given in the doctrines of the Church, "The Greek of the Word," the Latin of Swedenborg, and in elocution. Nearly half of the proposed endowment of \$50,000 had been secured. An address from the British Conference made especial mention of the spiritual good that had resulted from the interchange of New Church books between England and America. The work of greatest interest now was the projected publication by Professor Tafel of Swedenborg's treatise on "The Brain," which contemplates natural things from within. The revised version of the New Testament was also likely to be of interest to the New Church, and must be examined "with respect to its being a proper basis for the spiritual sense." An address was presented from the Australasian Conference of the New Church, announcing its organization. The Committee on Foreign Correspondence presented communications from Professor Loreto Soccia, in Italy; F. Goerintz, in Germany; A.

Byesen, in Sweden; William Winslow, in Denmark; S. Baumann, in Switzerland; and Mr. Schineck, in East Prussia. The letters mentioned the progress of the religious movement in Italy and Sicily, accompanied by larger sales of Swedenborg's works than had ever before been made, and the translation of many new works of the Church into the German language. An address was received from the Swiss society of the New Church in reply to the address of the Convention of 1879.

The American Swedenborg Printing and Publishing Society supplied more than sixty libraries with full or partial sets of Swedenborg's works during 1880. It also made a beginning of publishing the writings of the Church in a cheap form, and had published two editions of the "Four Doctrines," at the price of ten cents a copy, wholesale. It was engaged in publishing the works of Swedenborg in Latin, and had ready the "Apocalypsis Revelata," with the "Coronis," "De Divino Amore," and "De Divina Sapientia," soon to follow, and the "Apocalypsis Explicata," to be begun. The American New Church Tract and Publication Society had distributed to 1880 in all 22,500 volumes and 90,000 copies of tracts. It had also begun the publication of tracts in the German language.

The seventy-fourth General Conference of the New Church in Great Britain met in Manchester, August 8th. The Committee on Statistics returned the number of church-members as 5,192, against 5,199 as returned in the preceding year. Reports of correspondence were made from Sweden, Denmark, Buda-Pesth (Hungary), and Prussian Poland, and concerning the Italian missions. A Swedish translation of the "True Christian Religion" was in progress, of which a copy was to be presented to every Lutheran clergyman in Sweden, and a monthly paper was published in that country. Some books and a collection of hymns had been published, and a monthly paper was printed in Denmark. An agent in Prussian Poland had sold several copies of "Heaven and Hell" and the "Divine Providence" in the Polish language. A committee which had been appointed at the previous conference to revise the creed of the Church, presented a report which was not accepted, and another committee was appointed. A resolution was passed expressing appreciation of the value of the revised version of the New Testament, but declining to advise members of the Church to use it either in public or family worship. The Building Fund Committee reported a balance on hand of £700, but that no applications for grants were before it.

The seventy-first anniversary of the Swedenborgian Society, British and Foreign, was held May 21st. The translation of the Swedenborgian books into the Hindoo tongues had been begun, and a specimen of the first work in Marathi was shown to the numbers present at the anniversary meetings.

NEW HAMPSHIRE. Section one of the act providing for minority representation in corporations, passed by the Legislature of 1879, and submitted to the people for ratification or rejection at the November election of 1880, was ratified by a majority of the voters, viz., 22,560 for, 10,375 against; whole number of votes, 32,935.

The biennial session of the Legislature opened on June 1st. In the organization of that body, Chester B. Jordan, of Lancaster, was elected Speaker of the House of Representatives, and John Kimball, of Concord, President of the Senate.

Both Houses met in joint assembly on June 2d, to ascertain and publish the results of the State election held November 2, 1880, when the President formally declared, as duly elected for Governor, Charles H. Bell; and for State Councilors from the five districts, Thomas J. Jameson, Lyman D. Stevens, John W. Wheeler, George H. Stowell, and Arthur L. Meserve.

The chief officers of the State executive departments were elected by the Legislature in joint assembly, on June 15th, as follows: For Secretary of State, Eli B. Thompson, of Concord; State Treasurer, Solon A. Carter; State Printer, Parsons B. Cogswell; Commissary-General, George E. Lane.

The official term of Edward H. Rollins, United States Senator from New Hampshire, expiring March 3, 1883, the question whether his successor should be elected by this Legislature or by that which will convene two years afterward, engrossed the attention of the Republican members during the first two weeks of the session. Large numbers of them insisted upon the legality of such election at either of the said two sessions. The Democratic members took no active part in the conflict, yet openly favored a two years' postponement of the disputed election, cherishing, it is said, a hope of a Democrat being elected Senator in that event. Governor Bell, in his inaugural address, called attention to this matter as one to be determined at the present session, and both Houses referred it to their respective judiciary committees for consideration and report; the resolution adopted in the Lower House for that purpose instructing its committee "to report at the earliest practicable hour."

The Senate went even further, as, by a resolution offered on June 7th, and adopted next day—yeas 13, nays 10—it requested the Supreme Court to answer the question whether the Legislature now sitting has the power of electing a Senator to represent the State in Congress for the term commencing March 4, 1883. The Supreme Court answered that question affirmatively in a written document dated June 10th, and signed by six of its seven justices; the seventh making no answer, and stating his reasons for it. On account of the character and importance of the matter involved, the answer of the Supreme Court to the Senate on the question proposed is here subjoined:

To the Senate of New Hampshire :

The undersigned have received an attested copy of the resolution of your honorable body, requiring the opinion of the Supreme Court upon the question whether the existing Legislature has the power and right to elect a person to represent the State in the Senate of the United States for the term beginning March 4, 1883.

The first inquiry is, whether this is an important question of law on which the Senate is authorized to require the opinion of the court. It is evidently a question of law, and an important one; and it is none the less such a question because it is in our judgment free from all difficulty and doubt. It is a question of law necessary to be determined by the State Senate in the performance of its duties as a branch of the Legislature. We see no reason to doubt that it is constitutionally entitled to our opinion. In giving such an opinion, the justices do not act as a court, but as the constitutional advisers of either branch of the Legislature requiring their opinion; and it has never been considered essential that the question proposed should be such as might come before them in their judicial capacity. (126 Mass., 566; 53 N. H., 641.)

"The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof for six years." (Constitution of the United States, Article I, section 3.)

The right of each State is not merely to be represented by two Senators, but to be represented by two Senators chosen by its Legislature.

The legislative duty of choosing Senators is comprehended in the State right of being represented by Senators chosen by the Legislature. The senatorial term is six years; "chosen by the Legislature for six years," is the language of the Constitution. The primary right of the State is not to be represented five years and nine months, or any other part of each senatorial term, by two Senators chosen by the Legislature, but to be represented during the whole of each term by two Senators so chosen; and the manifest constitutional duty of the Legislature is to elect Senators at such times that the State may be represented by two Senators, chosen by the Legislature thereof for six years.

"The Constitution of the United States is the supreme law of the land, and so long as it remains in force in its present form, there can be no power, State or Federal, legally capable of depriving a State of the right which the Constitution has conferred upon it, or of relieving the Legislature from the duty which the Constitution has imposed upon it. And there is no more power to legally suspend the right and duty for a day, than for six years, or for ever."

The next Legislature, having no official existence until June, 1883, can not elect a Senator for the full term of six years, beginning March 4, 1883. Therefore the refusal of the present Legislature to elect a Senator for that term would be a violation of the constitutional right of the State to be represented by two Senators, "chosen by the Legislature thereof for six years." Such a refusal, leaving the State for three months represented by only one Senator chosen by its Legislature, would be as plainly unconstitutional as similar refusals leaving the State for all time without any Senators so chosen.

If, by an aggressive act of any Federal or State power, the States could be constitutionally deprived of their senatorial rights, for any part of a senatorial term, there would be no limit of the disfranchisement to which they would be liable. If a State can be constitutionally deprived of the right to have its voice given in the Senate by members chosen by its Legislature, it can be constitutionally deprived of its voice and vote in both Houses of Congress, expelled from the Union, or reduced to the condition of a conquered province. Its national rights would not be legal rights, in the ordinary sense, if they could be legally taken away without fault, without cause, without trial, and without remedy. A resolution of the Federal

Senate or an act of Congress, refusing to admit to their seats any more Senators from New Hampshire, chosen by its Legislature for six years, would, if carried into effect, violate the constitutional right of the State, but would not release the Legislature from their electoral duty. The performance of that duty would show that the State did not assent to its own disfranchisement.

When a vacancy happens by resignation or otherwise during the recess of the Legislature, the executive may make a temporary appointment until the next meeting of the Legislature, which shall then fill the vacancy (Article I, section 3). This power of temporarily filling vacancies by appointment is not a limitation of the right of the State or the duty of the Legislature. It is the constitutional right of the State that no vacancy shall be caused by the refusal of the present Legislature to choose a Senator.

The Federal Senate is the judge of the elections of its own members; and the legal presumption is, that it will admit a person duly qualified and legally elected. It is not, and can not be, bound to a contrary course by any action that has been or can be taken by itself or by Congress. Its published proceedings and debates furnish satisfactory evidence that it would admit a member chosen by the present Legislature, and that the doctrine of disorganization, equally hostile to the rights of the States and the perpetuity of the Union, is not held by that learned and honorable body. But if it should turn out that we are mistaken in this, the electoral duty of the present Legislature would not cease to be a constitutional one.

Congress has power to prescribe the time and manner of holding elections for Senators (Article I, section 4); and it has exercised that power. (Rev. Statutes, U. S., sections 14, 15.)

But as Congress can not legally violate the constitutional right of the State to be represented by two Senators chosen by the Legislature, and as that right would be violated by the refusal of the present Legislature to elect, it is not necessary to inquire into the validity of the act of Congress. But having examined the act, it may not be out of place to express the opinion that it is constitutional, because it can not be fairly construed to be a denial of the constitutional electoral duty of the present Legislature. Section 15, prescribing the manner of election, has no bearing on the present question, which is a question of the time only. Section 14 fixes the time. It provides, in substance, that a Senator shall be elected by the Legislature which is chosen next preceding the beginning of a senatorial term.

The Legislature here intended is a body of men who are the Legislature before the beginning of the senatorial term, and not a body of men who will be the Legislature, if they are alive, three months after the beginning of the term.

The legal meaning is easily and clearly settled by two elementary rules of interpretation. The first rule is, that the evil intended to be removed is strong evidence of the remedy intended to be provided. The evil was the election of Senators at too early a day by a Legislature that was not the latest one that could elect for the full term of six years. The remedy was the fixing such a time that the duty of electing for the full term should fall upon the latest Legislature that could perform the duty. The other and equally decisive rule of interpretation is, that Congress, as a legislative body, is presumed to have intended not to infringe constitutional rights, and to make a law that would be valid. The application of these rules leads to the conclusion that Congress meant a Legislature competent to perform the duty of maintaining the State right by electing a Senator for the full term, and not a Legislature incapable of performing that duty.

Congress has not power to prescribe the form of the State Constitution, or to fix the time when the Legislature shall be elected, or when its official term shall begin, or disfranchise a State for not making such a Constitution as Congress approves.

The Constitution of this State is constitutional and valid, and the State can not be legally deprived of its right to have a Senator elected by its Legislature for a full term on the ground that the election of the Legislature of June, 1883, occurs in November, 1882.

Concord, June 10, 1881.

C. DOE,
WILLIAM L. FOSTER,
C. W. STANLEY,
W. H. ALLEN,
ISAAC W. SMITH,
LEWIS W. CLARK.

Not having had an opportunity carefully to consider the question submitted by the Honorable Senate, and also being in doubt whether it is one upon which the opinion of the court may properly be required under the Constitution, I make no answer and express no opinion.

I. N. BLODGETT.

The Judiciary Committee of the Lower House reported on the senatorial election on June 9th, and that of the Senate on June 14th; both denying all electoral right to the present Legislature, and for about the same reasons variously expressed in the two reports, but mainly based on the letter of the statute regulating the election of Senators, and on the interpretation given it by the Committee on Privileges and Elections of the United States Senate in 1878, when a bill was referred to them involving the identical question whether the successor to Bainbridge Wadleigh, United States Senator from New Hampshire, whose term was to expire March 3, 1879, should be elected by the State Legislature at the June session of 1878, which was then holding, or at the session to be held in June, 1879—three months after the beginning of the term to be provided for. The said committee reported the right to elect in the proposed case to belong to the last-named session, by reason that it would be held by a State Legislature chosen in November, 1878, i. e., *next preceding* the expiration of Mr. Wadleigh's term, as the statute ordains; which report was accepted by the United States Senate, and, in accordance with its recommendation, the bill which had occasioned it was indefinitely postponed. The two Judiciary Committees of the State Legislature conclude their reports with recommending the passage of suitable resolutions; the one proposed by the Lower House committee being, "That the House will not go into an election of United States Senator at this session; and that the subject be postponed to the next Legislature."

This resolution was the subject of very hot and almost continuous debate during many days, several motions to amend having in the interval been made, discussed at length, and voted down, until the resolution itself was finally put on June 14th, and adopted by a *viva voce* vote, the majority of the votes for it having numbered sixty-four.

After the matter had been thus ultimately settled, sixty-four members of the Legislature—sixty-two Representatives and two Senators—who had been most active in bringing about that result, signed and published an address "To the Republicans of New Hampshire," dated June session, 1881, and entitled "The

Senatorial Question," setting forth the reasons of their action at great length. Among other things, they state the sentiment and expectation of the people of New Hampshire generally to have been that no election of a United States Senator should have taken place at this session; upon which they say, "To outrage this public sentiment by violating a positive law of Congress, and prematurely seizing a senatorship two years before the lawful time, seemed to us grossly partisan, highly inexpedient, and in every aspect injudicious and unwise."

The State finances appear to be in a very satisfactory condition. The sum of \$139,693 was paid last year on the principal of the public debt, which is now reduced to \$3,372,770.05, all liabilities included. State bonds to the amount of \$450,000 becoming due on September 1, 1884, the Governor recommends an increase of the annual State tax from \$400,000 to \$500,000 for the ensuing two years, to the end of canceling the said bonds at maturity.

The aggregate value of taxable property of all sorts—movable and immovable—in New Hampshire, and the amount of taxes levied on it for the current year, appear from the subjoined table, prepared by the State Board of Equalization. The totals for all the counties together were as follows: Polls, \$89,171; money, \$17,356,505; all other personal, \$18,959,343; real estate, \$123,511,284; total inventory, \$168,964,903; amount of taxes, \$2,615,684.32.

The polls enumerated in this table are valued for the purpose of taxation at one hundred dollars each.

The amount stated under the title of "total inventory" in the foregoing table does not include the moneys deposited in the savings-banks, except that portion of them which is invested in real estate; leaving \$31,913,113 of such deposits to be reckoned apart. By the addition of this sum the grand total of the property taxed in New Hampshire is \$200,878,016.

The aggregate taxes also, as above given, do not include the savings-banks tax, \$319,131.13, nor the railroad and telegraph taxes, \$176,792 (estimated as assessed in the previous year), which two items being added make the entire amount of taxes for the present year \$3,111,007.

The average rate of taxation, with regard to property, is \$1.46 on \$100 of valuation, the preceding year's average having been \$1.44; and, with regard to persons, it is little less than nine dollars for every inhabitant in the State, and a little more than thirty-five dollars for each voter.

A separate table published by the Board of Equalization shows the number, value, and average of certain kinds of live-stock in New Hampshire, of which the totals for the entire State are as follows: Horses, 59,447; valued at \$3,389,790; average value, \$57.02. Oxen, 26,751; valued at \$1,258,120; average value, \$47.03. Cows, 96,574; valued at \$2,226,486;

average value, \$23.05. Other neat stock, 63,142; valued at \$1,024,946; average value, \$16.23; sheep, 229,049; valued at \$650,175; average value, \$2.84.

The values and averages given here for the State are quite different from those marked in the same table for single counties; and the counties also vary considerably from each other in that respect. It is averred that even in the same county, and in towns lying close to one another, the difference in the value of the same animals is so great that intentional undervaluation to the detriment of the State and other tax-payers is suspected. Of these discrepancies, in regard to different counties and to towns of the same counties, the following instances are given: "Horses are valued at \$105 each in Milford, and at \$31 in Livermore; oxen at \$70 each in Keene, and at \$30 in Livermore; cows at \$35 each in Manchester, and at \$11.61 in Albany; other stock at \$24.28 in Rollinsford, and at \$7.80 in Randolph; and sheep at \$5 in Atkinson, and at \$1.70 in Acworth. These are the extremes, and the valuations range all along between them. And the extremes in the several counties are nearly as great. For instance, in Rockingham, horses average \$85.70 in Portsmouth, and \$36.80 in Chester; oxen average \$64.65 in Exeter, and \$37.10 in Chester; and so on through all counties there will be found like extremes, and in all these classes of animals."

The amounts of taxable property held in New Hampshire by the twenty-two railway companies operating within her borders, and the taxes assessed on them, respectively, are stated in the table on the following page, transmitted by the Board of Equalization to the House of Representatives.

The aggregate deposits in the 64 savings-banks of New Hampshire amount to \$32,097,734.17, which is \$3,838,126.76 more than in 1880. The number of depositors exceeds that of last year by 9,602, they being at present 96,881. The amount deposited averages between ninety and one hundred dollars for every man, woman, and child in the State, and about one fourth of the inhabitants are depositors.

The State Board of Agriculture, which was established eleven years ago, has held about 400 meetings, given more than 2,000 lectures, maintained an extensive correspondence, and issued nine printed volumes—the tenth being nearly ready—for the promotion of the knowledge and interests of agriculture. To this may be added the service it has rendered by the analyses of commercial fertilizers, and, more recently, by its duties in relation to the licensing of venders of various articles essential to the farmer, with a view to the prevention of fraud and imposition. For this the expense to the State has not exceeded \$4,000 a year, one half of which was for printing.

The State Normal School is under wise direction. The sum of \$3,500 has been appropriated to this school. The present number

of students in attendance is 49—females 47, males 2.

In the State Asylum for the Insane there were, at the beginning of the last corporate year, 235 enrolled patients—males 129, females 156. Admitted during the twelve months, 134—males 71, females 63. Whole number under care during the year, 419—men 200, women 219. Discharged within the year, 95—men 54, women 41; died, 22—males 10, females 12; number of patients at the year's close, 302—men 136, women 166. This has been the largest number of patients within the institution since its establishment in 1843.

The Asylum's farm proper consists of about 100 acres. Its income in 1843, the first year of the institution, was \$561.67; in 1880 it had been \$8,827.37. Among the products of the farm last year were 100 tons of hay, 950 bushels of potatoes, 2,500 pounds of cabbage, 3,000 heads of celery, 8,400 pounds of pork, and 22,812 gallons of milk.

An act was passed at the session of the Legislature for a new apportionment of representatives in that body, enumerating all the towns and wards of cities entitled to elect one or two representatives each, according to the respective number of its inhabitants, as shown by the State census of 1880. To towns having less than the constitutional number of inhabitants required for the election of a representative the act gives a proportional representation.

The June session of 1881 was closed by final adjournment on August 19th, having lasted eighty days—the longest sitting of a New Hampshire General Court on record. As to the laws of a general importance enacted at this session there were the following: "To aid ship-building"; "Providing for a report of the number and causes of divorces"; "To legalize the erection of telegraph and telephone poles and wires, and similar structures for electric lighting"; "To establish a State Board of Health." The board is to consist of the Governor, the Attor-

ney-General, and four other members—three of them physicians and one a civil engineer—all to be appointed by the Governor, with the advice and consent of his Council.

The population of the State by counties, in 1880 and in 1870, was as follows:

COUNTIES.	1880.	1870.
Belknap.....	17,948	17,681
Carroll.....	18,224	17,382
Cheshire.....	25,794	27,265
Coos.....	18,550	14,932
Grafton.....	38,783	39,108
Hillsborough.....	75,634	64,285
Merrimack.....	46,306	42,151
Rockingham.....	49,064	47,297
Stafford.....	35,553	30,243
Sullivan.....	18,161	18,058
The State.....	346,991	318,300

NEW JERSEY. The Legislature for 1881 consisted of 15 Republicans, 5 Democrats, and 1 Independent in the Senate, and of 34 Republicans and 26 Democrats in the House. It assembled at the beginning of the year, and remained in session until the close of March. On the 25th of January, William J. Sewell, Republican, was chosen United States Senator over Theodore F. Randolph, Democrat, by a vote of 12 to 5 in the Senate, and 32 to 26 in the House. On the 18th of January, George C. Ludlow delivered his inaugural address as Governor. He called attention, among other things, to the necessity of a revision of the tax laws, and to the importance of preparing and adopting a system of general laws for the government of municipalities. These measures had been considered at previous sessions, and commissions to investigate and report upon the subjects had been appointed and had reported, but no final action had been taken by the Legislature.

The income and expenditures of the State are divided by the Treasurer into four general accounts, viz.: Agricultural College Fund, State Library Fund, School Fund, and State Fund.

The Agricultural College Fund is composed of State bonds resulting from the sale of lands donated by the General Government. The income from these securities, amounting to \$6,960, is collected by the State Treasurer and paid over to the Trustees of Rutgers Scientific School for certain specified purposes.

The State Library Fund consists of an unexpended balance of \$128.50, an annual appropriation of \$750, and a special appropriation made by the Legislature of 1881 of \$1,500, amounting to \$2,378.30. Of this amount, there was expended during the year, \$1,737.02, leaving a balance for the coming year of \$641.28, in addition to the annual appropriation of \$750 above mentioned. This account is not treated as a separate fund by the Comptroller, its income being derived exclusively from appropriations from the State Fund.

The reports show a steady increase in the receipts and accumulations of the School Fund. This is due to the fact that not only is there annually added to the principal amount a large sum of money derived from the sale and lease of riparian lands, but that the income of the fund from investments already made exceeds the only expenditure which can, under present laws, be made from it, viz., an appropriation of \$100,000 to aid in the support of public schools. The assets of the fund, at the close of the fiscal year, were as follows:

Railroad and bank stock.....	\$46,500 00
United States bonds.....	305,000 00
Railroad bonds.....	117,000 00
State and city bonds.....	35,000 00
Bonds of school districts.....	92,700 00
Bonds and mortgages.....	938,108 50
Principal of riparian leases.....	959,574 95
Real estate.....	82,000 00

Total.....	\$2,595,883 45
Interest due on bonds and mortgages.....	47,154 79
Rents due on riparian leases.....	55,913 61
Cash on hand.....	200,706 15

Total property of the fund..... \$2,599,658 00

These figures show an increase, since the last report, of \$135,589.05.

The receipts of the fund and the sources from which they are derived are shown by the following summary:

Interest on United States bonds.....	\$12,975 00
Interest on railroad bonds.....	7,020 00
Interest on New Jersey bonds.....	1,200 00
Interest on Jersey City bonds.....	900 00
Interest on bonds of school districts.....	6,245 70
Dividends on bank stock.....	660 00
Dividends on railroad stock.....	3,550 00
Interest on bonds and mortgages.....	43,347 84
Rentals on riparian leases.....	61,235 52
Grants of riparian lands.....	7,816 41
Tax on Hibernia Mine Railroad.....	747 05
Rent of real estate.....	1,213 75
Loans paid off, and leases converted into grants.....	120,453 28
Total.....	\$267,369 05

There should be deducted from this amount the last item of \$120,458.28, because it is not properly to be considered as a part of the income of the fund, but as a change in the form of the securities from loans and leases to cash in hand. This leaves, as the actual income of the fund, \$146,910.77. The only disbursement

which can, at present, be made from these receipts is the \$100,000 above mentioned; and this being made, leaves a balance of nearly \$47,000 to be invested, or otherwise disposed of. There is no reason to believe that this income will decrease in future years, as the investments from which it is derived are safe and substantial. On the contrary, it is reasonably certain that it will be increased, because of the continued receipts from the sale and lease of riparian lands, and the expected collection of the amount due as unpaid interest on bonds and mortgages and rents on riparian leases already made. It is considered that the method of levying the two-mill tax for the support of public schools, under the act of 1881, will produce over the yield of the previous year an increase of \$304,955.32.

Under the title of the State Fund are recorded the receipts and expenditures for the maintenance of the government of the State. The securities of this fund are stated as follows:

Stock of the joint companies.....	\$285,700 00
Bonds of the joint companies.....	24,000 00
Centennial stock.....	74,116 67
Bonds of the several counties for surplus revenue of the United States, loaned.....	764,670 44
Total.....	\$1,151,487 11

From this amount there should be deducted the Centennial stock, which is valueless, and the bonds of the counties, on which no interest is paid. This will leave as actual assets the stocks and bonds of the joint companies, of a par value of \$312,700.

The operations of the State Fund are thus summarized from the statements of the Comptroller:

Balance in bank November 1, 1880....	\$334,730 45
Receipts.....	878,747 87

Total.....	\$1,263,478 32
Disbursements.....	1,006,208 98

Balance in bank October 31, 1881.. \$167,274 39

The receipts and disbursements for the years 1880 and 1881 were as follows:

	1880.	1881.
RECEIPTS.		
Total receipts.....	\$1,075,421 10	\$878,747 87
Balance on hand at beginning of year.....	316,688 69	884,780 45
Total.....	\$1,392,109 79	\$1,263,478 32
DISBURSEMENTS.		
Total disbursements.....	\$1,007,379 84	\$1,096,208 98
Balance on hand at close of year.....	884,780 79	167,274 39
Total.....	\$1,392,109 79	\$1,263,478 32

The Comptroller estimates the expenditures of the year 1882 at \$1,190,000—an excess over his estimate of the receipts for the year 1881, and the available bank balance, of \$264,569.36. Recognizing the inability of any possible receipts to meet these expenditures, he points out two courses of action, without

recommending either of them—the sale of a sufficient amount of the State's securities, or the imposition of a State tax. "The first method," says the Governor, in his message to the Legislature of 1882, "I agree with my predecessors, would be ill-judged; because the possession of these securities enable the Treasury to borrow money to meet any unexpected demand, as has often occurred in the past, and undoubtedly will in the future; and because it would result only in a postponement and aggravation of the evil attempted to be treated, inasmuch as the State would be deprived of the income now derived from them. As to the second plan suggested, I feel that, while it is advisable that the government of the State should be administered with reasonable liberality, it is equally clear that the people have the right to demand that that administration should be as economical as is consistent with the dignity and well-being of the State. Before resorting to the levying of a tax, therefore, our first duty should be to ascertain whether, or not, the receipts can not be increased, and the expenditures from, and charges against, the State Fund be judiciously reduced."

The Commissioner of the Sinking Fund gives the following statement of the assets of the fund:

Principal amount of mortgages	\$797,217 19
Interest due on same	44,749 04
United States bonds	20,000 00
Chambersburg school-bonds	8,000 00
Notes	8,508 37
Real estate (thirty-five pieces) purchased at foreclosure	373,512 85
Balance in bank	17,713 43
Total	\$1,265,000 43

The outstanding war bonds, for the security of which this fund is intended, amount to \$1,896,000. Of these bonds, \$100,000 mature each year up to 1891, and to meet them as they come due there is annually paid from the State Fund the sum of \$90,000, the Sinking Fund being required to provide the additional \$10,000 of principal and the amount of interest.

The business of the Riparian Commission for the year was very large, and shows a considerable increase over that of the preceding year. The commissioners report the following transactions during the year:

Grants of the fee	\$65,106 89
Leases, bearing 7 per cent interest	73,397 97
Total	\$138,503 93
Received on grants and leases of previous years	61,335 52
Total	\$200,339 50

There has been received since 1864, for riparian grants, the sum of \$1,389,908.34, in addition to which leases have been made of the principal amount of \$969,574.09. On these 7 per cent rent is paid.

The number of convicts in the State Prison, on the 31st of October, 1880, was 836; during the year 428 were received and 461 discharged, leaving the number in confinement on October 31, 1881, to be 803. The following statement

of the financial operations of the institution is given:

Maintenance	\$53,004 52
Less increase of inventory	1,195 84
	\$56,808 68
Repairs	8,785 87
Repairs extraordinary	7,550 83
Salaries of deputies, etc.	46,345 19
Salaries of supervisor, keeper, and inspectors ..	9,207 84
Paid discharged convicts	1,389 50
Total	\$125,086 46
By cash received from supervisor	56,147 52
Net loss to the State	\$68,888 94

This amount is \$21,528.67 in excess of the deficiency of the previous year. The increase is accounted for by a combination of circumstances: 1. There was a charge against the institution in 1881 of \$7,550 for repairs of shops injured by the fire; 2. The sum of \$1,500 was paid to a contractor for loss of time and business caused by the burning of the shops, and the payment diminishes the amount of cash reported as having been paid by the supervisor; 3. An excess of loss in productive labor this year over that of last, pending the rebuilding of the shops, amounting to about \$1,900; 4. The abandonment by one of the contractors of his contract, three months before it would have expired, at a loss to the State of \$2,400; 5. A loss in the employment of labor during the adjustment of the contracts under the new law, amounting to about \$13,400, making a total of \$26,750. The law passed at the last session of the Legislature, limiting the number of men to be employed in any one branch of labor to one hundred, has been strictly complied with by the authorities. Contracts have been made with different parties for the supplying of labor in the manufacture of seven different articles. These contracts, while requiring the manufacturers to pay for 20, 40, 80, and 100 men, whether used or not, allow them to employ as high as 100 men if their business requires it. And, as a matter of fact, there were used and paid for at times, in the month of October, as many as 475 men, with a daily average during the month of 419.

The inspectors and the supervisor unite in the statement, however, that, at the present rates received for the labor of the prisoners, even if all the men were employed, the State would not receive more than \$90,000 per annum. To meet the usual and ordinary expenses of the prison, \$120,000 is required. An offer was made to the supervisor in June by a manufacturer to take all the labor of the prisoners at rates which would have produced an annual income of \$110,000; but he was unable to accept it because of the law above mentioned, and contracts were made, as has been stated, which are expected, with other ordinary receipts, to produce some \$80,000.

The reports of the managers and superintendent of the Reform School for Boys show the number of the inmates at the beginning of the year to have been 258; committed and returned to the school during the year, 98; total,

356. Of this number 58 were returned to relatives and friends; 21 were put out to farmers; 5 escaped; 2 died; and 4 otherwise disposed of; total, 90. The number remaining in the institution on the 31st of October was 266. Of the number committed during the year, 13 were over the age fixed by the law, and 15 were for minor offenses, such as vagrancy, truancy, and incorrigibility. The financial statement shows receipts (exclusive of balance on hand) amounting to \$50,722.07, of which \$33,000 were from the State; \$15,492.16 from the labor of the boys on various contracts; \$1,978.82 from produce, material, and stock sold; and \$251.09 from miscellaneous sources. The disbursements were \$56,392.24, of which \$40,835.07 were for salaries, provisions, labor, fuel, clothing, and other expenses for the support of the institution; \$11,459.67 for machinery, farm implements, boilers and boiler-house, pumps and fire apparatus, furniture, repairs and improvements to buildings, and labor and machinery at brick-yard; and \$4,097.50 for new barns. The health of the institution has been unusually good. The farm has been worked at a profit of nearly \$5,000. The brick-yard turned out 460,000 bricks and 18,000 drain tiles. The shirt manufactory and laundry, in which the labor of the boys is hired out, produced an income of \$15,492.16.

The number of pupils in the Industrial School for Girls at the beginning of the year was 41; received, 9; total, 50. Of this number 15 were indentured, 5 discharged, and 5 were returned to their relatives—leaving 25 at the close of the year. The payment made by the State was \$3,000, which, with other receipts, amounted to \$6,692.72. Of this amount, \$6,200.40 was expended, leaving a balance of \$492.32.

The amount raised by the two-mill tax for public schools was \$1,322,740, an increase of \$304,955.32 over that of last year; and the number of pupils enrolled was 203,542, a decrease of 11,419 from that of the previous year.

There were during the year 236 pupils in the Normal School, and the last graduating class numbered 50 persons, nearly all of whom found immediate employment in schools throughout the State. The amount paid by the State during the last year on account of the institution was \$16,056.24—\$15,000 for support and \$1,056.24 for repairs.

The care of the insane in the State is intrusted to the State institutions at Trenton and Morristown, and to the county asylums in the counties of Essex, Hudson, Burlington, Camden, Passaic, and Cumberland. For the support of its insane the State pays \$1 per week for each county patient in the State and county asylums, and \$7 per week for each convict patient in the State asylums. Each county pays \$3 per week for each patient sent from it. These two payments are the principal sources of revenue of the State institutions.

The report of the managers of the Trenton asylum shows that there were at the beginning of the present fiscal year 550 patients under

treatment in that institution; 157 were admitted, making the total number under treatment 707; 130 were discharged or died, leaving 577 at the close of the year, of whom 461 are county, 36 State, and about 80 private patients. This number is as large as can be properly cared for and treated in the institution. The State patients are such as have been, after the commission of a crime, either declared innocent on the ground of insanity, or have become insane during the term of punishment. The managers renew their protest against the confinement of this class of patients in this asylum, because of the want of room for their classification, owing to the crowded condition of the institution, and because they are unable to make proper provision for the double duty of guarding them as prisoners and caring for them as patients. Of the 59 patients of this class which have been sent to the asylum, 7 have escaped, 8 have died, and 8 have been discharged as recovered, feigning insanity, etc. The inventory shows property of the value of \$114,300, an increase of \$5,314. There was paid from the State Treasury for the support of the institution during 1881 \$44,084.26, of which \$22,721.56 was for county patients; \$13,974.70 for insane convicts; \$7,200 for salaries, and \$188 for appraisement of property and fees of experts in determining insanity.

The Morristown asylum contained at the beginning of the fiscal year 586 patients; 187 were admitted, making the total number under treatment 773; of these 132 were discharged or died, leaving in the institution at the close of the year 641 patients, of whom 517 are county patients and 124 private patients. The annual inventory shows property of the value of \$99,473.14, an increase of \$749.98 over 1880. There was paid from the State Treasury to this institution during 1881, \$35,422.16, of which \$25,693.13 was for county patients, \$9,450 for salaries, and \$279.03 for expenses of appraisement and of the managers.

Of the several county asylums no knowledge is had except as to the number of patients for whom the State is called upon to pay one dollar per week under the act of April 4, 1873. The amount paid to these institutions during the year was \$41,329.28, a part of which, however, was for previous years for which no bills had been presented. The number of patients in the several institutions, at the date of their last bill presented to the Comptroller, was as follows: Essex, 303; Hudson, 217; Burlington, 67; Camden, 74; Passaic, 31; Cumberland, 71; a total of 763. How these patients are admitted, how cared for and treated, and how discharged, are matters about which the State authorities have neither any knowledge nor the means of securing any.

The State provides for the care and instruction of its unfortunate classes in the institutions of other States. The number of New Jersey pupils upon the rolls of the several institutions, and the amounts which they were

entitled to charge for the same, during the past year, were:

PUPILS.	Number.	Amount.
Deaf and dumb.....	156	\$48,004
Blind.....	40	11,390
Feeble-minded.....	57	14,790
Total.....	..	\$74,184

To the Home for Disabled Soldiers the State has contributed in the last nine years over \$369,000. The report of the institution for 1881 shows that there were 360 inmates on October 31, 1880; new admissions during the year, 112; re-admissions, 221; total, 693. There were discharged, 272; expelled, 21; and 36 have died, leaving, at the close of the year, 364 inmates. Of the total number of inmates during the year, 556 served in the New Jersey regiments, and 138 in those of other States and the regular Army and Navy. Out of a total expenditure of \$35,000, \$10,000 was for "out-patients."

The number liable to militia duty in the State is 223,094. The National Guard is organized as one division of two brigades. The First Brigade is composed of four regiments, two battalions of infantry, and one battery of artillery, numbering 156 officers and 1,801 men, and the Second Brigade of three regiments of infantry and one Gatling gun company, numbering 111 officers and 1,374 men. One Gatling gun company, with four officers and 54 men, is unattached. The entire force of the National Guard, including the general field and staff officers, is, therefore, 312 officers and 3,229 men, being an increase of 132 over the previous year. The entire expenses of the National Guard during the past year, as reported by the Quartermaster-General, were \$73,515.22, against \$79,225.69 for the previous year.

The Agricultural College is supported without expense to the State, the income from the fund derived from the sale of lands donated by the General Government being used in part payment of salaries, and Rutgers College providing the rest. The annual report shows that the institution is well managed; there were on the rolls last year forty-six pupils, thirty-seven from thirteen counties of this State and nine from other States.

The Agricultural-Experiment Station has been in successful operation.

By the report of the Labor Bureau it is shown that there are in the State 6,959 manufacturing establishments, with a capital of \$105,838,951; employing an average of 120,532 persons; paying \$43,757,753 in wages, and producing annually \$245,000,000 worth of wares.

There was paid from the State Treasury during the year, on account of pensions, the sum of \$7,837.22. The law of 1874 provided for the payment of a pension of \$100 per year to soldiers and sailors of the War of 1812, until the United States Government should take upon

itself the burden. This was done in 1878; and the pensioners of New Jersey were all placed on the Government rolls, except twenty-eight, who, while they had been mustered into the service of the State in the defense of the coast, had not been made a part of the national forces. To these the State continues to pay the pension of \$100 per annum. It was made known to the Legislature, in 1880, that there were certain persons who, having been entitled to the pension under the act of 1874, had not presented their claims, and were, therefore, debarred from the benefits of the law of that year. By the acts of 1880 and 1881 it was provided that such persons should be entitled to receive the pension for the period between the passage of the act of 1874 and of the United States law in 1878—within a few days of four years. To the Adjutant-General was assigned the duty of authenticating these claims; and he has approved eleven of them and rejected one. There was paid to these claimants the sum of \$4,268.66. This, with the claims of the first-mentioned list, and about \$200 expenses in collecting claims from the United States Government, makes up the amount paid from the Treasury.

The abstract of ratables returned by the Boards of Assessors for the several counties shows the valuation of the taxable property as follows: Valuation of 1881—Atlantic, \$4,577,238; Bergen, \$16,097,571; Burlington, \$25,856,143; Camden, \$19,217,640; Cape May, \$3,525,265; Cumberland, \$12,111,000; Essex, \$108,494,000; Gloucester, \$13,736,260; Hudson, \$91,901,996.50; Hunterdon, \$21,067,571; Mercer, \$29,890,820; Middlesex, \$18,326,000; Monmouth, \$27,991,000; Morris, \$21,040,447; Ocean, \$3,228,998; Passaic, \$27,953,345; Salem, \$13,396,976; Somerset, \$16,300,000; Sussex, \$9,960,657; Union, \$24,016,100; Warren, \$18,762,295. Total, \$527,451,222.50. This shows an increase over 1880 of \$8,833,703.86.

The United States census report shows that \$1,742,198 was raised by tax in New Jersey for school purposes in 1880. Of the total population, 1,131,116 in the State, 39,136 over ten years of age can not read, and 53,249 can not write; of the latter, 44,049 are white, and 9,200 colored. The percentage of white is 4.03, and of colored 23.53.

Within the past ten years a large number of summer resorts has sprung up along the coast. From Sandy Hook to Cape May are Port Monmouth, Highlands, Sea Bright, Island Heights, Long Branch, Deal Beach, Asbury Park, Ocean Grove, Ocean Beach, Spring Lake, Sea Girt, Squan, Point Pleasant, Squan Beach, Lavalette City, Sea-side Park, Island Beach, Long Beach, Beach Haven, Brigantine Beach, Atlantic City, Absecon Beach, Peck's Beach, Leaning's Beach, Five-Mile Beach, Seaville, Ocean View, and Cape May. The largest of these sea-side resorts are Long Branch, Asbury Park, Atlantic City, and Cape May.

A commission to propose amendments to the

Constitution was in session during the year, but its labors were not closed. The only State officers voted for at the November election were members of the Legislature. The Legislature of 1882 is constituted as follows: Senate, 13 Republicans and 8 Democrats; House, 29 Republicans, 29 Democrats, 1 Independent Democrat, and 1 Independent Republican and Anti-Monopolist.

In 1880 Dr. Leeds was commissioned by the State of New Jersey to investigate the subject of adulteration, and report to the Legislature for its guidance in framing laws against the practice. In teas he found three forms of adulteration in use. In one class of adulterated samples, the smallest, there was an excess of mineral substances which could not have been introduced in facing or other processes of legitimate preparation. The commonest class of adulterants consisted of exhausted leaves, and the next largest class of leaves of other plants. Only 10 per cent of the teas examined were found to be adulterated. The samples of coffee tested, both whole and ground, were found to be pure with few exceptions. The only adulterant was chiccory. Coffee-essence was found to be composed of chiccory, with licorice and caramel, and a slight proportion of coffee. Most of the samples of sugar purchased at random were found to be pure. The brown sugars were those which most frequently contained glucose. Sirups also, even the cheapest, were found to be little adulterated with glucose. Free sulphuric acid and lime in excess were not observed in any samples. Flour was found to be invariably pure. In bread the presence of alum was occasionally detected. Cream of tartar was extensively adulterated with sulphate of lime, acid phosphate of lime, and starch. Bicarbonate of soda also contained, occasionally, sulphate of lime. Baking-powders are, in some factories, made only from bicarbonate of soda, cream of tartar, and starch; others of the manufacturers employ, partly or entirely, in the place of cream of tartar, alum, acid sulphate of lime, or a mixture of both these salts. Condiments and spices were found to be seldom pure. No injurious mineral substance, however, was detected in any of them. Vinegar was found in many samples to contain much less acetic acid than should have been present. Samples sold as white-wine vinegar appeared to be cider-vinegar filtered through charcoal. Green pickles contained copper in every instance, excepting brine-pickles and those bearing the label of an English firm. Canned vegetables showed traces of both tin and lead derived from the cans. Skimmed and watered milk was sold frequently in New Jersey and New York, notwithstanding the stringent enactments to prevent such practices. Condensed milk was far from uniform in composition, the percentage of water varying from 25.5 to 59 per cent, and of fat from 3 to 11 per cent.

The following table gives the population of

New Jersey, by counties, in the years 1880 and 1870:

NEW TESTAMENT, REVISION OF THE. A revised version of the New Testament, which had been prepared by committees of English and American scholars acting in co-operation under a resolution of the Convocation of Canterbury, was published in May. The efforts of which this work is the result began in 1856, when several movements were made in favor of a revision of the authorized version of the Scriptures. Resolutions were offered in the Convocation of Canterbury and in the House of Commons, praying for the appointment of a royal commission for the purpose, but no public action was taken in the matter at that time. In the same year, however, five scholars—the Rev. Henry Alford, afterward Dean of Canterbury; the Rev. John Barrow, D.D.; the Rev. C. J. Ellicott, D.D., now Bishop of Gloucester and Bristol; the Rev. W. H. Humphry; and the Rev. G. Moberly, D.C.L., now Bishop of Salisbury—on the invitation of the Society for the Propagation of the Gospel, undertook a revision of the Gospel of St. John. That work was published in the next year, and was followed in course by revisions of the Epistles to the Romans, Corinthians, Galatians, and Ephesians. The work was favorably received, and the hope was encouraged that a sober and conservative revision of the Scriptures might in due time be undertaken, under the same principles of the co-operation of independent minds and corporate and collegiate discussion as had directed its execution. The next movement toward a revision was made in 1870, when, on motion of the Bishop of Winchester, a committee was appointed in the Convocation of Canterbury to confer with a committee of the Convocation of York, and report upon the desirableness of a revision of the authorized version of the Old and New Testaments, “whether by marginal notes or otherwise, in all those passages where plain and clear errors, whether in the Greek text originally adopted

by the translators or in the translation made from the same, shall on due investigation be found to exist." The Convocation of York declined to participate in the work.

The Convocation of Canterbury, on the report of its committee, approved the following resolutions: "1. That it is desirable that a revision of the authorized version of the Scriptures be undertaken; 2. That the revision be so conducted as to comprise both marginal renderings and such emendations as it may be found necessary to insert in the text of the authorized version; 3. That in the above resolutions we do not contemplate any new translation of the Bible or any alteration of the language, except where, in the judgment of the most competent scholars, such change is necessary; 4. That in such necessary changes the style of the language employed in the existing version be closely followed; 5. That it is desirable that Convocation should nominate a body of its own members to undertake the work of revision, who shall be at liberty to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong." A joint committee of the two houses was appointed to report a scheme of revision on the principles thus laid down, and was empowered "to invite the co-operation of those whom they may judge fit, from their biblical scholarship, to aid them in their work." This committee invited about forty scholars and divines of different denominations to assist it, and organized the body into two committees, one for the Old Testament and the other for the New Testament. The Convocation afterward instructed its committee to invite the co-operation of some American divines, and two American committees were also constituted. The British committee for the New Testament was composed of Bishops Ellicott, of Gloucester and Bristol, and Moberly, of Salisbury; the Prolocutor (Dr. Bickersteth, now Dean of Lichfield); Deans Alford (of Canterbury) and Stanley (of Westminster), representing the Convocation of Canterbury; Archbishop Trench, of Dublin, of the Irish Episcopal Church; the Rev. Dr. Angus (Baptist), the Rev. Dr. Eadie (United Presbyterian Church of Scotland), the Rev. Dr. Hort (of Cambridge), the Rev. W. G. Humphry, Professor Kennedy (of Cambridge), Archdeacon Lee, Dr. Lightfoot (now Bishop of Durham), Professor Milligan (Church of Scotland), Professor Moulton (Wesleyan Methodist), Dr. J. H. Newman (now Cardinal Newman), Professor Newth (Congregationalist), Dr. A. Roberts (Church of Scotland, and author of "The Companion to the Revised Version," which was published simultaneously with the work, for the purpose of making the nature and object of the changes more clear to general readers), the Rev. Dr. Vance Smith (Unitarian), Dean Scott (of Rochester), Dr. Scrivener, Dr. Tregelles (Congregationalist), Dr. C. J. Vaughn (now Dean of Llandaff), Professor Westcott.

Bishop Wordsworth (of St. Andrews), Dr. D. Brown (of the Free Church of Scotland), and Dean Merivale were afterward added. Dr. Newman declined the invitation to serve. Dean Alford, Bishop Wilberforce, Dr. Tregelles, and Dr. Eadie died previous to 1876, and the place of Bishop Wilberforce was supplied by Professor (now Archdeacon) Palmer. The number of members throughout was about twenty-four, and the average attendance about sixteen.

The following persons constituted the American New Testament Committee: Theodore D. Woolsey, D. D., LL. D., ex-President of Yale College, President of the Committee; Professor J. Henry Thayer, D. D., of Andover Theological Seminary, Secretary; Professor Ezra Abbott, D. D., of Harvard Divinity School; Rev. J. K. Burr, D. D., of Trenton, N. J.; President Thomas Chase, LL. D., of Haverford College; Chancellor Howard Crosby, D. D., LL. D., of New York University; Professor Timothy Dwight, D. D., of Yale Divinity School; Professor A. C. Kendrick, D. D., LL. D., of the University of Rochester; the Right Reverend Alfred Lee, D. D., Protestant Episcopal Bishop of Delaware; Professor Matthew B. Riddle, D. D., of the Theological Seminary at Hartford, Connecticut; Professor Philip Schaff, D. D., LL. D., of Union Theological Seminary; Professor Charles Short, D. D., of New York, Secretary; Rev. E. A. Washburn, D. D., of Calvary Church, New York. Of others who were appointed on the committee, Professor James Hadley, LL. D., of Yale College, attended one session, but died in 1872; Professor H. B. Smith, D. D., LL. D., attended one session, but resigned on account of ill health, and died in 1877; Professor H. B. Hackett, D. D., LL. D., of Rochester Theological Seminary, died in 1876; Professor Charles Hodge, D. D., LL. D., of Princeton Theological Seminary, never attended any of the meetings, but corresponded with the committee, and died in 1878. Professor G. R. Crooks, D. D., of New York, and President W. F. Warren, D. D., of Boston University, accepted appointments on the committee, but were not able to attend its meetings.

The Bishop of Winchester, the Rev. Samuel Wilberforce, D. D., was titular president of the British New Testament Committee, but he attended only one of the meetings, and the Bishop of Gloucester and Bristol, the Rev. C. J. Ellicott, D. D., actually performed the duties of president. The expenses of the committee were mainly paid by the presses of the Universities of Oxford and Cambridge, which became owners of the copyright of the completed work.

The following rules were laid down for the government of all the committees: 1. To introduce as few alterations as possible in the text of the authorized version consistent with faithfulness. 2. To limit, as far as possible, the expression of such alterations to the language of the authorized and earlier English

versions. 3. Each company to go twice over the portion to be revised, once provisionally, the second time finally, and on principles of voting as hereinafter provided. 4. That the text to be adopted be that for which the evidence is decidedly preponderating, and that, when the text so adopted differs from that from which the authorized version was made, the alteration be indicated in the margin. 5. To make or retain no change in the text on the second final revision by each company, except two thirds of those present approve of the same, but on the first revision to decide by simple majorities. 6. In every case of proposed alteration that may have given rise to discussion, to defer the voting thereupon till the next meeting, whensoever the same shall be required by one third of those present at the meeting, such intended vote to be announced in the notice for the next meeting. 7. To revise the headings of chapters, pages, paragraphs, italics, and punctuation. 8. To refer, on the part of each company, when considered desirable, to divines, scholars, and literary men, whether at home or abroad, for their opinion.

Six years were spent in making the first revision. The work was transmitted as it was done, part by part, to the American Committee, who returned it with their criticisms and suggestions, and these were considered by the English Committee on a second revision. The second English revision was then transmitted to the American Committee and considered by them. The work was again examined for the removal of harshness of diction and the remedying of rhythmical defects, and, again, for the purpose of bringing all the renderings of words into harmony. Bishop Ellicott, in communicating the report of the committee to Convocation, attested the thoroughness with which the work had been done, with the remark that "there is not a hastily-arrived-at judgment to be found in any page of the revised version." He also stated that the volume was in every part the result of united and corporate discussion; that he did not believe there would be found in the whole volume "the faintest trace of a rendering which would adjust itself to one or other" of two competing views of the original Greek; and the rule had invariably been observed to put the judgment of the majority in the text, and that of the minority in the margin.

The committee also gave much attention to the consideration of the Greek text as the original from which the revision should be made. It did not confine itself to any particular manuscript or text, but used all, subjecting them to a critical examination for each passage, and selecting for each the form which, after such examination, appeared to be correct.

The first meeting of the English Committee was held on the 22d of June, 1870, and the last one on the 11th of November, 1880. Four hundred and seven meetings were held in the

interval, at three fourths of which one third of the company were in attendance.

The departures which the revisers have made from the authorized version are of two classes: those which have been made in consequence of the adoption of an amended text, and those which are due to an amended rendering of the already received text. Changes, owing to the former cause, may be found in every chapter, but most of them are regarded as of very little importance. It is only on rare occasions that differences of reading have been found to involve questions of doctrine, or to be otherwise entitled to be regarded as of very great consequence. Among the more conspicuous changes of this character are the omission of the doxology (Matt. vi, 13) to the Lord's prayer, and of three clauses from the Lord's prayer, as given in Luke xi, the fact of which is indicated by marginal notes; the indication, by a note in the margin, that the closing passage of the Gospel of Mark, xvi, 9-20, is of doubtful authenticity; the marking, by putting it in brackets, of the fact that the passage concerning the woman taken in adultery (John vii, 53; viii, 11) is probably, while many believe it may be quite historical, no part of the original gospel; and the omission, as without warrant of authority, of the passage, 1 John v, 7, 8, relating to the three heavenly witnesses. The verses mentioning the descent of the angel into the pool (John v, 3, 4); the prophecy of the parting of the garments of the Saviour at the time of the crucifixion (Matt. xxvii, 35); the notification by St. Mark (Mark xv, 28) of the fulfillment of prophecy; the rebuke to the disciples in Luke ix, 55; the statement to the Ethiopian eunuch of the necessity of faith before baptism (Acts viii, 37); and the liberty of Christians (Rom. xiv, 6) not to observe certain days, have been removed from the text. Ten entire verses have been excluded from the gospels, of which three (xvii, 21; xviii, 11; and xxiii, 14) are from Matthew; four (vii, 16; ix, 44; xi, 26; and xv, 28) from Mark; two (xvii, 36; xxiii, 17) from Luke; and one (v, 4) from John. The number of words and phrases omitted is considerably greater. The Rev. B. Pick, Ph. D., while regarding none of them as of doctrinal importance, has recorded among the more noticeable omissions of this class, thirty-seven in Matthew, forty-five in Mark, and nine in John, and adds that "the list can be largely increased with some yet smaller items."

The emendations in the rendering of the accepted text comprise the correction of positive mistakes in the translations of the Greek; the rectification of mistakes relative to the grammar of the original, under which head are included more particular attention to the significance of the articles, attempts to represent the tenses of the Greek (particularly the aorists and the other past tenses) more accurately, and pains to give more exact definitions of the prepositions; the removal of archaisms by which the sense in the authorized version is made un-

intelligible or obscure, and the more consistent translation of proper names; and the maintenance of consistency in translating the same Greek words, and avoidance of confusion in the translation of different ones. In carrying out the latter principles the revisers have adopted the opposite course to that of the translators of the authorized version, who sought to introduce variety of expression into their work, and have endeavored, except in those instances where the context did not admit of it, to give a single English word for the same Greek word, wherever it might be found. A conspicuous instance in which this rule has been applied, and one that has caused universal remark, is in St. Paul's eulogy of charity (1 Cor. xiii), where the word "love" has been substituted for "charity."

The number of alterations that have been made is stated by Bishop Ellicott to represent an average of between eight and nine changes in every five verses for the gospels, about one and a half of which are critical changes, and about fifteen changes for every five verses, one and a half of which, as before, are for critical reasons, in the epistles. The whole number of changes is about sixteen thousand five hundred. While a majority of the changes may be so slight that the effect to the general hearer or reader may be regarded, as Bishop Ellicott asserts, as really hardly perceptible, many of them attract attention at once, and some of them have been the objects of much criticism. Conspicuous among these are the insertion of "deliver us from the evil one" instead of "deliver us from evil" in the Lord's prayer, and the change in Acts xxvi, 23, from "Almost thou persuadest me to be a Christian" to "With but little persuasion thou wouldest fain make me a Christian." The word "hades" has been retained wherever it occurs, instead of being translated into "hell," as in the authorized version.

In the opinion of the majority of the critics of the work, doctrinal points have not been materially affected by the revision. Dean Stanley has pointed out that, while no change has been made in any of the doctrines which all Christians alike hold, some of the views or constructions commonly called doctrines have been placed in a new light. The great doctrine of the Trinity is shown by another writer to be set forth in some passages in a stronger light than that in which it stood before. On this point Bishop Ryle, of Liverpool, commends, very emphatically, the "glorious testimony" which the revision bears to the soundness of the whole doctrinal system of Christianity, remarking that "after ten years of patient and diligent investigation, after careful examination of versions and manuscripts not known two hundred and fifty years ago, after the united labor of the ablest committee of biblical scholars that could be got together—after all this, the revised version comes forth from the crucible without the loss of a single doctrine of our most holy faith—let me say with every

doctrine more fully established than ever. . . . Not a single stone in the fabric of Christian truth has been disturbed. The Trinity, the proper Deity of Christ, the personality of the Holy Ghost, remain just where they were, and are even more clearly brought out than before."

A very noticeable feature in the volume is the large number of marginal notes. Of these, some are short notes bearing on differences of reading in the Greek text adopted by the revisers, but the greater number specify differences of rendering to which it seemed proper to call attention, either because other renderings than were adopted were preferred by a minority of the company, or because they have been advocated by scholars of eminence.

The part which the American Committee has contributed toward the shaping of the revision is not shown in the finished work. The volume as published embodies all the changes suggested by the American Committee which were finally agreed upon, without any distinctive mark to indicate their American origin. It is represented that a considerable proportion of the readings and marginal notes adopted were suggested by the American revisers. Other new readings proposed by the American Committee, which were not accepted, were published in an appendix to the authorized edition of the revision, to go out in company with the accepted text, in order to give the critical public an opportunity to decide upon their merits and their fitness to be finally adopted. The recommendations thus embodied in the "American Appendix" are included in three categories, those described as "Classes of Passages," the readings proposed for particular passages, and suggestions for marginal readings additional to those which are given in the body of the volume. Among the emendations recommended under the first head are the elimination of the title "saint" from the designation of the apostles; the substitution of modern, well-established words and forms of speech for ancient and antiquated ones, as "Holy Spirit" for "Holy Ghost," "who" for "which" when a person is designated, "know" and "knew" for "wot" and "wist," "drag" and "dragging" for "hale" and "haling"; to discard the use of "be" where "is" or "are" is meant; the substitution of "steadfastness" or "steadfast endurance" for "patience"; the use of "demon" instead of "devil" wherever the Greek word is "daimon." The class of changes suggested for particular passages includes a considerable number of emendations proposed for the sake of a more correct translation of the original, and relative to cases where it was thought the translation might be improved, even though the rendering for which another was substituted might be regarded as sufficiently accurate. The emendations relative to marginal notes propose some renderings additional to those already incorporated; suggest the omission of some which have been adopted; and

recommend the incorporation of a few notes relative to different readings in the Greek manuscripts.

The report of the committee, embodying its completed work, was made to Convocation by its chairman, the Bishop of Gloucester and Bristol, May 17th. After the report was made, the thanks of the House were accorded to the members of the Revision Committee who had not been appointed by Convocation. The Bishop of London then made a statement of the position in which the revised work stood. It had been spoken of as if it would at once take the place of the authorized version. This was not the case, for no one at present (in the Church of England) could use the revised version. When the whole work was completed, it would go out to the public, and would be before the Church for consideration; it might be years before the proposed alterations from the authorized version had so approved themselves to the Church—both clergy and laity—that steps could be taken to give authority for the use of the revised version. The bishop further suggested that it would be well to avoid hasty criticism, and await the results of careful study before pronouncing too decidedly upon the merits and defects of the work. The real purpose and value of the revision were that it laid before the Church and the laity alike the opinions of ripe scholars and of the ancient Church, and the result was an exceedingly valuable one, upon which, however, no opinion could be given until after full study, and with adequate knowledge.

The work was at first less favorably received in England than in America, but commanded general attention from scholars and the public in both countries. It has since been subjected to a searching criticism in the literary reviews, and in various semi-ecclesiastical assemblies for discussion, particularly in the English diocesan synods and the Church Congress. It is admitted to have many excellent features, to present a considerable number of improvements over the authorized version, and to make many passages clearer than they appear in that work. On the other hand, some of the critics complain of the extent to which the revisers have carried their desire to secure accuracy and uniformity in translation; that, in many instances, they have paid more attention to transplanting the form of the Greek expression than to giving it an appropriate representation in equivalents of idiomatic English, so that the beauty and strength of passages of peculiar force in the authorized version are destroyed, without making them really more exact or more plain. At the same time the value of the work as an auxiliary to the authorized version and to biblical study in general is recognized by most even of the unfriendly critics; and a high place among works of that kind is freely accorded to it. On this point the Dean of Peterborough has remarked

that "English students of the New Testament will be sure that they have here, in the judgment of the best scholars of the age, a text framed on the most ancient authorities, and a version as accurate as they can make it"; and Dean Howson, of Chester, that "they have now in this small compact volume that which they indeed possessed before, but which is now digested, completed, and arranged."

No ecclesiastical body has definitely recommended the revised version for adoption in the services of the churches. Most of the general assemblies and conferences which have met since it was published have, however, expressed an appreciation of the value of the services of the revisers, and have recommended the work to the careful, candid study and consideration of their ministers and people.

The new version was published simultaneously in England and the United States on the 20th of May. The orders for the first day's sales in the two countries amounted to 2,250,000 copies. An immense public demand was manifested for the work, which was sold freely at all the book-stores and stalls, and even by street-peddlers in the cities for several weeks, till nearly every person possessed a copy. Numerous rival editions to the authorized one were published, some of which contained the authorized and the revised texts in parallel columns; some incorporated the suggestions of the American Committee in the body of the text; and the revision was even published in a daily paper. Finally, the extraordinary demand seemed supplied, and the sales fell off.

NEW YORK. The annual session of the New York Legislature began on the 4th of January. The regular presiding officer of the Senate is the Lieutenant-Governor of the State, but W. H. Robertson, of Westchester County, was chosen President *pro tem.*, to occupy the chair in his absence. George H. Sharpe, of Ulster County, was chosen Speaker of the Assembly, over Erastus Brooks, the Democratic candidate. The first days of the session were largely occupied with awaiting the appointment of standing committees and caucusing on nominations for United States Senator to succeed Francis Kernan, whose term was to expire March 3d. There were some differences among Republicans in regard to the selection of a candidate for Senator, arising out of an antagonism between what were known as the Conkling and anti-Conkling, or "Machine" and "Anti-machine" wings of the party. At a caucus held January 13th, 105 votes were cast, 54 of which were for Thomas C. Platt, 26 for Richard Crowley, 10 for Sherman S. Rogers, 10 for William A. Wheeler, 4 for Elbridge G. Lapham, and 1 for Levi P. Morton. Mr. Platt, who was identified with the Conkling wing, having received a majority of the votes, was declared the candidate. The Democrats, in a caucus on the 17th of January, unanimously nominated Francis Kernan. The election took place on the 18th, and resulted

in the choice of Mr. Platt, the vote being 25 for Platt and 3 for Kernan in the Senate, and 79 for Platt and 44 for Kernan in the Assembly, or 104 for Platt and 47 for Kernan on the joint ballot. Subsequent events made more marked the political divergence of sentiment among the Republicans. When, in March, Senator Robertson received the appointment for Collector of the Port of New York, his associates in the Senate adopted a resolution approving the choice made by the President, and this action was followed in the Assembly, but shortly afterward the latter body reconsidered its action and laid the resolution on the table. It had appeared that the appointment was particularly distasteful to the New York members of the United States Senate. (For particulars in regard to this appointment and the controversy which it occasioned, see title GARFIELD, JAMES A., and special session of the Senate under CONGRESS, in this volume.)

Senators Conkling and Platt announced their resignation from the United States Senate on the 16th of May, having addressed the following letter to Governor Cornell:

WASHINGTON, May 14, 1881.

SIR: Transmitting, as we do, our resignations, respectively, of the great trusts with which New York has honored us, it is fit that we acquaint you, and through you, the Legislature and people of the State, with the reasons which, in our judgment, make such a step respectful and necessary.

Some weeks ago the President sent to the Senate in a group of nominations several persons for public offices already filled. One of these offices is the collectorship of the port of New York, now held by General Merritt; another is the consul-generalship at London, now held by General Badeau; another is *chargé d'affaires* to Denmark, held by Mr. Cramer; another is the mission to Switzerland, held by Mr. Fish, son of the former distinguished Secretary of State. Mr. Fish had, in deference to ancient practice, placed his position at the disposal of the new Administration, but, like the other persons named, he was ready to remain at his post if permitted to do so. All these officers, save only Cramer, are citizens of New York. It was proposed to displace them all, not for any alleged faults, or for any alleged need or advantage to the public service, but in order to give the great office of Collector of the Port of New York to Mr. William H. Robertson, as a reward for certain acts of his, said to have "aided in making the nomination of General Garfield possible."

The chain of removals thus proposed was broken by General Badeau promptly declining to accept the new place to which he was to be sent. These nominations summoned every member of the Senate to say whether he advised such transaction. The movement was more than a surprise. We had been told, only a few hours before, that no removals in New York offices were soon to be made, or even considered, and had been requested to withhold papers and suggestions bearing on the subject, which had been sent to us for presentation should occasion arise, until we had notice from the President of his readiness to receive them. Hearing that the Vice-President was equally surprised, we went to Mr. James, the Cabinet officer from our State, and learned that, though he had spent some time with the President on the morning of the day the nominations were sent in, no disclosure of an intention to send them had been made to him, and that he first knew of the matter by hearsay following the event. After earnest reflection and consultation we, believing the proceeding unwise and wrong,

whether considered wholly in relation to the preservation and integrity of the public service and as a public example to be set, or in relation also to the integrity of the Republican party, no public utterance or comment or censure was made by either of us in the Senate or elsewhere. On the contrary, we thought the President would reconsider an action so sudden and heavy, and would, at least, adopt less startling and objectionable modes of requiring personal or individual service. In this hope the following paper was prepared, and signed and presented by Mr. James to the President, who was subsequently informed that you had authorized your name to be added also:

"TO THE PRESIDENT: We beg leave to remonstrate against a change in the collectorship at New York by the removal of Mr. Merritt and the appointment of Mr. Robertson. The proposal was wholly a surprise. We heard of it only when the several nominations involved in the plan were announced in the Senate. We had, only two days before this, been informed from you that a change in the customs officers at New York was not contemplated, and, quite ignorant of the purpose to take any action now, we had no opportunity, until after the nominations, to make the suggestions we now present. We do not believe that the interests of the public service will be benefited by removing the present collector and putting Mr. Robertson in his stead. Our opinion is quite the reverse. We believe no political advantage can be gained for either the Republican party or its principles. Believing that no individual has claims or obligations which should be liquidated in such mode, we earnestly and respectfully ask that the nomination of Mr. Robertson be withdrawn.

CHESTER A. ARTHUR,
"THOMAS C. PLATT,
"THOMAS L. JAMES,
"ROSCOE CONKLING."

This paper was presented to the President by Mr. James on Monday, the 28th of March. Knowing the frequency with which every one of the twenty Presidents of the Republic, and markedly the present incumbent, had withdrawn nominations on less serious representations, we did not apprehend that such suggestions would be treated as an intrusion, or an invasion of any prerogative of the nominating power. We were disappointed. Immediately the public press, especially in articles and dispatches written by those in close and constant association with the President and with influential members of his Cabinet, teemed with violent denunciations of the Senators from New York for "opposing the Administration and dictating" to the President. Persons who visited the Executive Mansion reported the President as resentful and impatient of hesitation to advise and consent to what he proposed. We had made no assault upon anybody. We have at all times refused to answer questions by representatives of the press or to make complaint or comment, or even denial, of the many truthless articles published against us by officious champions of the Administration. Indeed, beyond confidential consultations with brother Senators and officials, we have said nothing until now on the subject. Nor have we, or either of us, promoted the dead-lock in the Senate in order to prevent or influence action on any nomination, nor have we ever so stated.

Immediately after the nominations were published, letters and telegrams in great numbers came from every part of the State from its leading citizens, protesting against the proposed changes and condemning them on many grounds. Several thousands of leading mercantile firms in New York, constituting, we are informed, a majority of every branch of trade, sent us remonstrances; sixty of the eighty-one Republican members of the Assembly, by letter or memorial, made objections; representatives in Congress, State officials, business men, professional men, commercial men, industrial and political organizations are among the remonstrants, and they speak from every

section of the State. Besides the nominations already referred to, there were awaiting the action of the Senate several citizens of New York named for offices connected with courts—district attorneys and marshals. These were all re-appointments; most of them had been originally commissioned by Mr. Hayes. They were certified by the judges of courts and many other eminent persons who attested the faithfulness and merits of their service, and recommended their continuance. They were not presented by us. We have not attempted to dictate, nor have we asked the nomination of one person to any office in the State. Indeed, with the sole exception of the written request, set forth above, we have never even expressed our opinion to the President in any case, unless questioned in regard to it.

Some days ago, the President abruptly withdrew, in one and the same act, the names of General Woodford and Mr. Tenny, and of two marshals. This unprecedented proceeding, whether permissible by law or not, was gravely significant. The President had nominated these officers after they had been weighed in the balance. Their official records were before him, and had been fully scrutinized and approved. It must be presumed that he thought the nominations fit to be made, and that it was his duty to make them. There is no allegation that he discovered any unfitness in them afterward. It could hardly be that he discovered unfitness in all of them alike. What, then, was the meaning and purpose of this peremptory step? It was immediately stated, as if by authority, and seems to be admitted, that the purpose was to force the Senate or Senators to vote as they could not vote if left free from Executive interference: it was to control the action of Senators touching matters committed by the Constitution to the Senate exclusively. It has been suggested, in addition, that by recalling these nominations and holding them in his own hand, the President might, in the event of the failure of another nomination, use them to compensate that failure. If it can be supposed all these public trusts are to be, or would in any event be made personal perquisites to be handled and disposed of, not only to punish independence of senatorial votes and action, but liquidate personal obligations of any individual, however high in station, the conditions are utterly vicious and degrading, and their acceptance would compel representatives of States to fling down their oath and representative duty at the footstool of executive power. Following this sweeping and startling executive act came ominous avowals that dissent, or failure to "advise and consent," would be held an act of offense, exposing all Senators from whatever State to the Executive displeasure. Thus we found ourselves confronted by the question whether we shall surrender the plain right and sworn duty of Senators by consenting to what we believed to be vicious and hurtful, or be assigned a position of disloyalty to the Administration which we helped bring in, and the success of which we earnestly wish for. We know no theory avowed by any party which requires such submission as is now exacted. Although party service may be fairly considered in making the selection for public offices, it can hardly be maintained that the Senate is bound to remove without cause incumbents merely to make place for those whom any individual, even the President or a member of his Cabinet, wishes to repay for being recreant to others or serviceable to him. Only about two years ago the Senate advised that General Merritt be appointed collector at New York. It is understood that among the Senators who so advised was Mr. Windom, now Secretary of the Treasury, and head of the department whose subordinate General Merritt is. Another Senator known to have given this advice was Mr. Kirkwood, now Secretary of the Interior. It is said, like the Postmaster-General from our own State, that these Cabinet officers were not taken into consultation touching the removal of General Merritt, but their sworn and official action as Senators is none the less instructive. That

the late Secretary of the Treasury of the late Administration up to its expiration, less than ten weeks ago, approved General Merritt as an officer, is well known, and it is not here suggested that any citizen had petitioned for his removal, or that official delinquency on his part is the reason of it. In place of an experienced officer in the midst of his term fixed by law, it is proposed suddenly to put a man in who has no training for the position and who can not be said to have any special fitness for its official duties. In the inaugural of President Garfield, delivered on the 4th of March, stand these words: "The civil service can never be placed on a satisfactory basis until it is regulated by law. For the good of the service itself, for the protection of those who are intrusted with the appointing power against the waste of time and the obstruction of the public business caused by the inordinate pressure for place, and for the protection of incumbents against intrigue and wrong, I shall at the proper time ask Congress to fix the tenure of minor offices in the several executive departments, and prescribe the grounds upon which removals be made during the terms for which incumbents have been appointed." How good a distinction is which would make the major offices a prey to intrigue and wrong and shield the minor offices from a like horde, and decide whether the collectorships of the country should belong to the exposed or to the protected class, need not be discussed here. Assuming General Merritt to be an officer of average fitness and honesty, it might be reasonably argued that all Senators should, with alacrity, advise his displacement by means of obvious superiority. Possibly it might be said that all should advise the selection in General Merritt's place of a man who, without any superior fitness, had rendered his country, or even his party, conspicuous or exalted service. The case in hand does not belong to either of these classes. The vocation of Mr. Robertson and his legislative and professional experience and surroundings do not denote a superiority of these qualities, the knowledge, business habits, and familiarity with the revenue laws and system of the United States which might make him more competent than General Merritt to collect the vast revenues and administer the vast business pertaining to the port of New York. He certainly can not in this respect be held an exception to the rules of right and consistency on which the Constitution and laws have placed the public service. We know of no personal or political service rendered by Mr. Robertson so transcendent that the collectorship of New York should be taken in the midst of a term and given him as a recompense. Mr. Robertson is reported by the "New York Tribune" as declaring that his nomination was a "reward," a "reward for his action as a delegate to the National Convention." If Mr. Robertson in his action was influenced by a sense of duty, if he voted and acted his honest conviction, it is difficult to see what claim he had for any reward, not to speak of such a great reward. The action of which an estimate is thus invited is understood to be this: Mr. Robertson and sixty-nine other men accepted from the State Convention a certain trust. They sought and accepted the position of agents or delegates to the National Convention. The State Convention declared that its plainly stated judgment and policy was to be observed and supported by those it commissioned. To this declaration all selected as delegates gave implied consent, but several of them in addition made most specific personal pledges and engagements to exert themselves in good faith throughout to secure the nomination of General Grant. They made this pledge as a means of obtaining their own appointments as delegates, and they did, as we both personally know, obtain their seats in the National Convention upon the faith of their personal statements of their earnestness and fidelity. The obligation thus assumed we understood to involve integrity, as much as the obligation of one who receives the proxy of a stockholder in a corporation upon a pledge and promise to vote as his prin-

cipal would vote. Whether Mr. Robertson was or was not himself bound, not only by honor and implication, but by expressly giving his word, becomes quite immaterial in view of the claim made for him. It is insisted that he "organized the bolt," or, as it has been sometimes stated, "he was the leader of the bolt." This is to say that he invited, persuaded, or induced others whom he knew had given their word and had obtained their sents by doing so, to violate their word and betray not only the Republicans assembled in State Convention, but the Republicans of their districts as well, who had trusted in their honor. Whoever counsels and procures another to do a dishonest or dishonorable act must share with that other the guilt, and should share, also, the odium justly attaching to it. We are, therefore, wholly unable, upon whatever ground we put it, to see justification for ourselves, should we become parties to using the public trusts which belong to the people to require such service in such modes. But the appliances employed to effect the results set up new standards of responsibility, and invade, as we believe, the truths and principles on which the separate and co-ordinate branches of the Government stand. A Senator has his own responsibility; he is amenable to his State and to the body of which he is a member; he is bound by his oath to "advise and consent" on his conscience and judgment before God, whatever or whoever else may constrain him; he is to be exempt from executive menace and disfavor on the one hand, and executive inducement on the other.

Long standing on the orders of the House of Commons has been a declaration that a member shall suffer expulsion who even shall report the wishes of the executive head of the government to influence the votes of members. The British Constitution is not more jealous than ours in this regard. To give advice, and honest, independent advice, as to appointments proposed, is as much the right and duty of a Senator as it is the right or duty of the President to propose. Be his advice one way or the other, it is no more an act of disrespect or treason to the nominating power than the verdict of a jury or the decision of a judge. The idea that the Senate has simply to find out what is wanted, and then do it, we can not believe safe or admissible, and thus far no party has dared or descended to set up such a test of party fidelity or allegiance. In this instance, such prominence has been given to the subject and such distrust has been expressed of the correctness of our position, that we think it right and dutiful to submit the matter to the power to which alone we are bound and ever ready to bow. The Legislature is in session. It is Republican in its majority, and New York abounds in sons quite as able as we to bear her message and commission in the Senate of the United States. With a profound sense of the obligation we owe, with devotion to the Republican party and its creed—"liberty and right"—with reverent attachment to the great State whose interests and honor are dear to us, we hold it respectful to make room for those who may correct all records we have made and interpret aright all duties we have misconserved. We therefore inclose our resignations, but hold fast the privilege, as citizens and Republicans, to stand for the constitutional rights of all men and of all representatives, whether of the States, the nation, or the people.

We have the honor to be, very respectfully,

Your obedient servants,

ROSCOE CONKLING,
THOMAS C. PLATT.

To his Excellency Governor Cornell, Albany, N. Y.

The resignation of the Senators was announced to the two Houses of the Legislature on the 19th of May, and, according to the provisions of the Federal statute, it would be necessary to begin balloting for their successors on the 31st. It soon became evident that it

was the purpose of Messrs. Conkling and Platt to seek a re-election as a vindication of the course they had seen fit to adopt, and that they would meet with a resolute opposition from a considerable number of the Republican members of the Senate and Assembly. It so happened that the committee on the part of the Assembly charged with the duty of calling a caucus in case it was required, was controlled by the "Stalwart" wing, and that on the part of the Senate by the Administration, or "Half-Breed" wing of the party, as these factions were popularly designated. The opponents of the ex-Senators were generally averse to a caucus, fearing that it would be so controlled and directed as to put them in the position of regular candidates for re-election. General George H. Sharpe, chairman of the Assembly Committee, requested Mr. Dennis McCarthy, chairman of the Senate Committee, to secure action for a joint invitation to a caucus. The committees, however, failed to co-operate, and an effort to secure a call for a caucus, signed by a majority of the Republican members of the two Houses, was also unsuccessful, and no Republican caucus was held before the date for balloting arrived. The Democrats held a caucus and nominated John C. Jacobs as a candidate for the seat vacated by Mr. Conkling, and Francis Kernan for that vacated by Mr. Platt. The first ballot was taken on the 31st of May. The Democratic vote of 7 in the Senate and 47 in the Assembly was united on the regular candidates, except that Mr. Jacobs himself, who was a member of the Senate, voted for George B. Bradley for the short-term vacancy. The Republican vote was divided among nineteen candidates. Mr. Conkling received 9 from the Senate and 26 from the Assembly, or 35 in all; 19 were given to William A. Wheeler, 13 to Sherman S. Rogers, 9 to Alonzo B. Cornell, 5 to Richard Crowley, 4 to Charles J. Folger, 3 to Theodore M. Pomeroy, two each to Henry E. Tremain, Andrew D. White, James W. Wadsworth, William M. Evarts, and Thomas G. Alvord, and one each to Hamilton Ward, Warner Miller, Samuel S. Edick, Reuben E. Fenton, Orlow W. Chapman, Silas B. Dutcher, and Hamilton Fish. The Republican vote for the long-term vacancy was: For Thomas C. Platt, 8 from the Senate and 21 from the Assembly, or 29 in all; 21 for Chauncey M. Depew, 12 for Alonzo B. Cornell, 8 for Elbridge G. Lapham, 6 for Charles J. Folger, 5 for William M. Evarts, 5 for Warner Miller, 3 for Richard Crowley, two each for Levi P. Morton, James W. Wadsworth, Henry E. Tremain, Noah Davis, Joseph H. Choate, and Sherman S. Rogers, and one each for George H. Sharpe, Theodore M. Pomeroy, William A. Wheeler, and John M. Francis. The full Republican strength was 25 in the Senate and 81 in the Assembly. The vote given to Conkling and Platt on this first ballot was regarded as indicating their entire support, and was at no time exceeded in the long con-

test that followed. The balloting continued without special incident until the 9th of June, the Republican vote, other than that cast for Conkling and Platt, varying from day to day. On the date mentioned, S. H. Bradley, of Cattaraugus County, made a personal explanation in the Assembly, in which he charged Loren B. Sessions, of the Senate, with offering him the sum of \$2,000 to cast his vote for Chauncey M. Depew. The candidacy of Mr. Jacobs, on the part of the Democrats, had been the subject of some criticism, on account of the fact that he was a member of the Legislature, and after the twenty-third ballot, which took place on the 22d of June, he withdrew. A caucus was held the same day, and after explanations from Mr. Jacobs and others, the name of Clarkson N. Potter was substituted. The vote on the twenty-fifth ballot stood as follows: For the short-term vacancy, Potter, 53; William A. Wheeler, 50; Roscoe Conkling, 32; Elbridge G. Lapham, 17; George G. Hoskins, 3, and Charles J. Folger, 1; for the long-term vacancy, Francis Kernan, 53; Chauncey M. Depew, 52; Thomas C. Platt, 27; A. B. Cornell, 7; Richard Crowley, 6; George G. Hoskins, 5; Elbridge G. Lapham, 3, and Henry E. Tremaine, 1. After the thirty-first ballot, which took place July 1st, Mr. Platt withdrew from the contest, the vote standing then for the place which he had vacated—Kernan, 53; Depew, 51; Platt, 28; Cornell, 11; Crowley, 7; Lapham, 2; Tremaine, 1, and Wheeler, 1. His vote was immediately scattered, the larger part of it going at first to Crowley. An effort was made at this time to secure a conference of Republican members, and sixty-two signatures were obtained to the following "call":

Whereas, More than four weeks have been spent in a vain attempt to elect two United States Senators to fill the vacancies occasioned by the resignation of the Hon. Roscoe Conkling and the Hon. Thomas C. Platt; and

Whereas, We believe it to be our imperative duty, demanded alike by the interests of members of this Legislature and by the interests of the whole people, speedily to fill said vacancies: therefore

We, the undersigned, Republican members of the Legislature, do hereby agree that when sixty-five or more Republican members of the Legislature shall have signed this paper we will attend a conference of such signers, together with all other Republican members who may join us, and at such conference proceed to vote *viva voce* for candidates to fill said vacancies; and when two candidates shall have each received fifty-four votes cast in said conference, sixty-five or more voting, we will make said candidates so receiving such number of votes our candidates at the next and each succeeding meeting of the joint Assembly until the said candidates shall be elected, provided one candidate shall be selected from each of the two principal divisions of the Republican party.

Said conference shall be held at the Assembly Chamber at the call of the first five signers of this paper, and invitations to attend said conference shall be extended to all Republican members of the Legislature, whether their names appear hereon or not.

The conference, at which sixty-seven members were present, was held on the 8th of July, forty-one ballots having then been taken. Mr.

Depew withdrew his name and declined to be a candidate, taking occasion to repel various charges and accusations that had been made in regard to his position and conduct. Five ballots were taken in the caucus for a candidate for the position vacated by Mr. Conkling, which finally resulted in a union of all the votes on Mr. Warner Miller. Elbridge G. Lapham was nominated for the place vacated by Mr. Platt, receiving thirty-eight of the sixty-six votes cast on the first ballot. The original supporters of Conkling and Platt for re-election took no part in the conference, and refused to vote for the candidates on the ballotings which followed in the joint session of the two Houses. The vote on the forty-second ballot for the short-term vacancy was: Lapham, 67; Potter, 50; Conkling, 31, and Cornell, 1; total, 149; necessary for a choice, 75; for the long-term vacancy: Miller, 68; Kernan, 50; Wheeler, 19; Rogers, 4; Cornell, 1, and seven "scattering." The voting continued in the same spirit until July 17th, when, on the forty-eighth ballot, Speaker Sharpe, of the Assembly, declared his purpose of voting for the conference candidates. The result of the vote on that day was for Conkling's former seat: Lapham, 68; Conkling, 29; Potter, 47, and Evarts, 1; for Platt's place Miller received seventy-six votes, including those of one Senator and seven Assemblymen who had hitherto acted with the "Stalwarts"; Kernan's vote was forty-seven, and the rest of the Republican votes were scattered among nine candidates, Fish receiving nine and Wheeler four. Miller was declared elected. The contest in behalf of Conkling was kept up some days longer, and an attempt was made by his supporters to secure an adjournment, and the consequent postponement of the election to the next session. Finally, on the 22d of July, the "Stalwarts," in conference, adopted the following resolution:

Resolved, If a conference of the Republicans in the Legislature be called without stating the purpose of such conference, that all attend the same; that in conference we take a stand for a caucus, to be held at some future time, for the purpose of nominating a United States Senator; that if such demand for a caucus at a future time be conceded, we attend the same, and if properly and duly held will abide the result; that if such demand is not conceded, we retire from the conference.

This having been adopted as an expression of the determination reached, a more definite form was given to the action by the following:

Resolved, To be the sense of this conference that Senators Winslow and Braman be requested to see and agree with Judge Robertson that if he will announce to the meeting of the joint convention to-day that a conference of all Republicans is called for this afternoon or evening, for the purpose of nominating a candidate for United States Senator, we agree to attend said conference or caucus and abide by the result of such nomination.

Accordingly, after the first ballot of that day, a recess was taken, and Senator Robert-

son, the presiding officer of the joint Assembly, announced that a conference of Republicans would be held immediately. After some discussion as to the means of bringing about a "regular caucus," it was voted to adjourn and "meet in caucus" at three o'clock, for the purpose of nominating a candidate for United States Senator. The "Stalwarts" took part in the caucus, and the vote for candidate was: Lapham, 61; Conkling, 28; Evarts, 1; and Stewart L. Woodford, 1. The nomination of Lapham was then made unanimous on motion of Senator Winslow, who had been a prominent supporter of Conkling. The joint Assembly resumed its session at 5 p. m., and the fifty-sixth ballot on the election of a successor of Senator Conkling was taken, resulting in ninety-two votes for Lapham and forty-two for Potter.

WARNER MILLER was born in Oswego County, August 12, 1838, his parents being of German extraction. He was educated in the public schools of his native county, and passed through Union College, graduating in 1860. He then engaged in teaching at the Fort Edward Collegiate Institute, but on the breaking out of the civil war enlisted as a private in the Fifth New York Cavalry. Serving under Sheridan in the Shenandoah Valley, he was promoted to a lieutenant. After the battle of Winchester he was taken prisoner and paroled on the field, and soon after received an honorable discharge from the army and went to Europe. There he became interested in the subject of paper-manufacture, and on his return established a manufactory at Herkimer. In this business he has continued to the present time. His first active participation in politics was in 1872, when he was a delegate to the National Republican Convention at Philadelphia. He was elected to the State Assembly in 1874, and re-elected in 1875. In 1878 he became a candidate for Congress in the Twenty-second District, which included the counties of Herkimer, Jefferson, and Lewis. He was elected in November of that year, and re-elected to the Forty-seventh Congress in 1880.

ELBRIDGE G. LAPHAM was born at Farmington, New York, October 18, 1814. His early life was spent on a farm, and his education was obtained in the common schools and at the Canandaigua Academy, where he was a classmate of Stephen A. Douglas. After leaving the academy he studied civil engineering, and was for a time employed as a civil engineer on the Michigan Southern Railroad. Relinquishing that employment, he studied law, and was admitted to the bar in 1844, soon after which he settled at Canandaigua, where he still resides. In 1867 he was a member of the New York Constitutional Convention, but was never a candidate for a political office until 1874, when he was nominated and elected as Representative of the Twenty-seventh District in Congress. He was successively re-elected in

1876, 1878, and 1880. In Congress he has been regarded as a careful and conscientious rather than a brilliant legislator, and in politics was in general sympathy with the Conkling wing of the party.

The charge of bribery made by Assemblyman Bradley against Senator Sessions, to which reference has been made, led to an investigation by a committee of the Assembly, the result of which was reported by the Republican majority and the Democratic minority of the committee on the 5th of July. In the mean time Mr. Sessions and others had been indicted for bribery by the Grand Jury of Albany County. The report of the majority of the committee was short, the following being all but the introductory part:

Eminent counsel appeared for and in behalf of the persons charged by Mr. Bradley with making the proposition to him, and the committee was represented by able counsel, to whom was intrusted the conduct of the inquiry into all the matters that were brought to the attention of the committee. The investigation extended through a period of about two weeks, and the printed report of the testimony taken and the proceedings had formed a volume of 500 pages, which accompany this report. The testimony of Mr. Bradley was direct and positive, and he unequivocally charged that on the 8th day of June last he was approached by the Hon. Loren B. Sessions, a member of the present Senate of this State, who at the same time offered and paid to him the sum of \$2,000 for the purpose of influencing and inducing him to change his vote for United States Senator and to cast his vote for Chauncey M. Depew for said office. The denial of Mr. Sessions was as definite as the charge of Mr. Bradley, and his testimony in support thereof was equally positive. The remaining evidence in the case is circumstantial. Besides the testimony relating to the charge preferred by Mr. Bradley, evidence was adduced upon the investigation tending to prove that active members of the Assembly had been approached by one Charles A. Edwards, with corrupt proposals and offers of money, for the purpose of influencing their votes for Chauncey M. Depew for United States Senator. During a portion of the time that the investigation was in progress the District Attorney of the County of Albany was present and heard the testimony, being the officer especially charged by the Constitution and laws of the State with the prosecution of the said persons charged with the offense of attempt to bribe. He instituted proceedings against such persons as soon as practicable.

After the examination of the witnesses who were produced and sworn before the committee, and before the proceedings and testimony were printed and furnished to the committee and an opportunity was given them to examine it for the purpose of reporting thereon, Senator Sessions and Charles A. Edwards, who were charged with the crime, and others were severally indicted by a Grand Jury of the County of Albany, upon which indictment they were arraigned and handed over for a trial in the Court of Sessions of said county, a court having jurisdiction in the premises. Official information of the finding of the bills of indictment and the subsequent proceedings taken as above stated was furnished to the committee by the said district attorney, as will appear from the following communication, viz.:

"CITY OF ALBANY, DISTRICT ATTORNEY'S OFFICE,
June 30, 1881.

"DEAR SIR: In response to your request to be informed as to whether the newspaper reports to the effect that Senator Sessions, A. D. Barber, E. R. Phelps, and Charles A. Edwards have been indicted for attempted bribery of members of the Legislature

are true or not, I would say that these reports are correct; that they have been arraigned, pleaded not guilty, and have given bail. They will be tried as soon as I can properly prepare their cases for trial.

"Very respectfully, yours,

"D. CADY HERRICK, District Attorney."

The courts having taken cognizance of the offenses charged to have been committed, and which are the same that the committee was required to investigate, the committee is of the opinion that, without further instructions from the Assembly, it would be improper and unwise for them to prejudice the cases by rendering or submitting to the Assembly a decision upon the evidence that has been taken therein, and therefore they submit with this report the evidence and proceedings taken on such investigation for the consideration of the Assembly. From the nature of the resolution it may be well doubted if it were expected or intended that the committee should go further than to report the evidence and proceedings. It is not probable that at the time of the adoption of the resolution it was contemplated that immediate action would be taken by the courts in respect to the matters intrusted to the committee for investigation. The committee deem it proper to express the opinion that in view of the agitation and excitement that exist respecting the election of United States Senators, in connection with which the charges of bribery and attempt to bribe were made, any action or attempted action on the part of the committee, in advising or attempting to advise the Assembly in regard to the charges, would tend to embarrass the administration of justice; that it would not be just to the people or the accused, and that it would be disrespectful to the courts which have taken cognizance of all the criminal acts and offenses alleged to have been committed by the parties referred to or in any way implicated.

KIDDER M. SCOTT,
E. A. CARPENTER,
A. S. DRAPER,
CHARLES R. SKINNER,
T. BOARDMAN.

Dated July 5, 1881.

The minority report, which was signed by Assemblymen Brooks and Shanley, dealt with the subject more fully, presenting the substance of the evidence and announcing the following facts as established:

1. The positive use and misuse of money at Albany in connection with the election of two United States Senators in the canvass growing out of the resignation of Senators Conkling and Platt.

2. The presence in Albany of a large number of citizens, official and otherwise, State and Federal, intrusted and engaged in the election of two United States Senators by the State Legislature, to which body the Constitution and the laws commit the sole right of elections. While there is no proof of the positive use of money by the so-called lobby to control the Legislature in the election of Senators in Congress, there is evidence of undue influence of men holding both Federal and State offices to control this election, and this undue influence includes the almost constant presence of the Vice-President of the United States, and the almost constant presence of the two United States Senators who resigned their places, one of whom, through thirty-one ballots, asked for a re-election from the Legislature which gave him his first election. The presence of other candidates has also been conspicuous from the beginning.

3. The evidence also includes the fact that Senator Sessions, pending the election, drew from the banking-house of Spencer Trask & Co. \$6,616, and closed his accounts at this bank on the 17th of June. The sums of \$12,500, \$3,500, \$2,000, and \$20,000 were drawn by parties friendly to Mr. Depew, but no evidence was given that any part of the money here named, except the \$2,000 paid to Mr. Bradley, was

used for any corrupt purpose; nor is there any proof of any intention so to use it.

4. The promise was made of a high Federal office—that of United States Marshal within the District of New York—to one member of the Legislature to influence his vote for a Senator in Congress, the promise or expectation coming from a United States commissioner and United States supervisor of elections, John I. Davenport. It was made to State Senator Strahan, of New York city, at the Union League Club, on the night of the 18th of May, and was made to influence Mr. Strahan's vote in the election of Senators in Congress; but it is proper to state that when Mr. Davenport appeared before the committee he confined his so-called "authority" simply and solely to Mr. Knox, the friend of Senator Strahan, who was confirmed as marshal on the following day. It is also proper to state that Senator Strahan was not in any way moved from his purpose of action at Albany by any of the promises of Mr. Davenport in New York, whether they were genuine or not.

5. The apparent tender of money for legislation and the promise of money in the case of three, if not four, members of the Assembly for votes or influence growing out of the election of Senators, was before the committee, but without any positive knowledge of the exhibition of money, though in one case it was presented in an envelope, bearing the name of Mr. Armstrong, of Oneida, and supposed to contain money, but this was to compensate him for his vote upon a bill which had passed the Legislature, and the offer was rejected. The testimony does not show one dollar received by any member of the Legislature or directly offered in the form of money for a vote for any candidate for Senator in Congress, except, as before stated, in the one case of Mr. Bradley, who, at page 10 of the testimony, swears that Mr. Sessions said, "I can get you a thousand dollars to put in your vest-pocket to vote for Mr. Depew"; who there listened to this enticement, talked about it, said it would be just as bad to vote for Chauncey M. Depew without getting any money as to get it, listened again to the temptation and statement, "I will go up-stairs and see what is the best I can do"; and from this temptation, by appointment with Mr. Sessions (pages 11 and 14), he went first to the room of Mr. Sessions, and then went up one story to his own room, where, the door being locked by Mr. Bradley, both men seated themselves, and the money was paid to him in three bills of \$500 each, and in ten bills of \$50 each. In the report of this interview there was no dispute, while Mr. Sessions (page 21), in regard to the money, swears "There was not one word said in relation to money at all, and that there never was any allusion made to money by him nor by me." What may also be called a mystery is the use of nearly \$50,000 in currency by men of established credit and with accounts in banks at Albany, New York, Utica, and Buffalo, and the carrying of large sums of money about the persons of their owners, instead of using either express companies for the transmission of money as between New York, Albany, and Buffalo, or the use of bank-checks, which business-men are accustomed to use in the transmission of money, and in all ordinary business transactions.

The following resolutions were also presented as proper for the approval of the Assembly:

Resolved, That it is in evidence before the select committee that Samuel H. Bradley, member of the Assembly from the First District of Cattaraugus County, was in possession of \$2,000, which sum of money, upon his own sworn statement alone, was placed in his hands on the 8th of June, 1881, in his own room at the Kenmore Hotel, by Loren B. Sessions, State Senator, representing the Thirty-second Senatorial District in the Legislature of 1880-'81, and composed of the counties of Cattaraugus and Chautauqua.

Resolved, That the receipt of this money by Mr. Bradley for his expected and promised vote for Chauncey M. Depew, a candidate before the Legislat-

ure for United States Senator, was in violation of the law of 1869 and of the State Constitution adopted in 1874, both of which make the receipt of money for the object or purpose named an offense defined as felony. The willing receipt of money for a vote in the Legislature, even for the alleged purpose of exposing the person offering the bribe, is not contemplated as an innocent act either by the provisions of the Constitution or by the laws of the State (chapter 742, passed in 1869) which particularized the act, the offense, and the punishment.

Resolved, That while it is in evidence that Senator Sessions has been accustomed to receive sums of money, and in one case as large a sum as \$500, for his work and influence in securing the passage of a single bill through the Legislature, and that before his election to the Senate he had the reputation of being what is commonly known and understood as a "lobbyist," the only evidence before the committee that \$2,000 was paid by him to Samuel H. Bradley for his expected and promised vote for Chauncey M. Depew, is the sworn statement of Mr. Bradley himself. No other evidence came before the committee that shows that any other sum of money was paid to, or received by, any other member of the Legislature.

Resolved, That in regard to the use of money pending the senatorial canvass, there is complete evidence of the fact that Mr. Sessions drew from his bankers—Messrs. Spencer Trask & Co.—the sum of \$6,616 in currency, and that nearly \$50,000, including this sum, was drawn and used by other parties friendly to Mr. Depew, but no evidence was offered that any part of this money was used to control or influence the choice of Senators. The parties drawing the money, so far as they became witnesses, swear that it was used in their own private business. It did not please the counsel on either side to call, as witnesses, Messrs. Barber, Edwards, or Phelps, whose names were most prominent in the use of the several sums of money named before the committee.

Resolved, That the testimony taken before the committee appointed by the Assembly on the 9th of June, 1881, be laid before the District Attorney and Grand Jury of the County of Albany for such examination and action as by them may be deemed necessary in the appointed trials to come before the court, and with the wish of the committee and of the Assembly that in every case, whenever and wherever there has been any violation of the law or of the Constitution, there may be a thorough prosecution of the same, and such punishment provided as is due for the crime committed.

The majority report, however, was adopted. The bribery case against Loren B. Sessions came up in the Albany Court of Sessions in September, but was continued to the next term, and in January, 1882, a motion was pending before Judge Westbrook, of the Supreme Court, at Kingston, for its transfer to the Court of Oyer and Terminer, a stay of proceedings having been previously ordered by Judge Ingalls.

The session of the Legislature came to an end on the 23d of July, the day after the senatorial elections were completed. The work had been greatly interrupted and many important measures were defeated. A peculiar characteristic of the session was the unusual number of bills which failed to receive the approval of the Governor. No less than eighty-six veto messages were submitted, expressing positive disapproval of measures which had passed both Houses, besides which a considerable number failed to receive the Governor's signature after the adjournment of the session. Among the more important of the vetoed bills was one

providing for a new aqueduct and an additional water-supply for the city of New York. Many of the others were of local importance only. The objections to the various bills took a wide range. Some were regarded as unnecessary, others as unconstitutional; some were loosely drawn, and many provided for expenditures which the Governor did not consider judicious. A large number of items in the annual supply bill were disapproved as extravagant or unjustifiable. One of the early incidents of the session was a reception of General Grant, while on a visit to Albany, in which the two Houses joined.

One of the most important subjects to come before the Legislature was that of completing the revision of the laws relating to assessment and taxation, which had been begun in 1880. A joint committee was appointed to take this in hand, consisting of five Senators and eight Assemblymen, and the Governor was authorized to appoint an advisory commission, of not more than seven nor less than three members, to aid in the work. To act upon this commission the Governor appointed Joshua M. Van Cott, of Kings County; Samuel D. Babcock, of New York; Thaddeus Hait, of Ulster; Edward W. Foster, of St. Lawrence; John F. Seymour, of Oneida; George Geddes, of Onondaga; and Alonzo Bradner, of Livingston—but Mr. Babcock declined to serve, and his place was taken by Andrew H. Green. The joint committee and the commission worked more or less in conjunction, but the latter body acted only in an advisory capacity, having no direct relations with the Legislature. The result of their joint efforts was the reporting of sixteen bills, only eight of which were passed: two were defeated in the Senate, and therefore abandoned in the Assembly; two were defeated in the Assembly, and not acted upon in the Senate; one was rejected by both Houses; and three which passed the Assembly failed to secure action in the Senate. Those which became laws were—1, one amending the law defining lands, and making it include railroad-tracks, telegraph poles and lines, underground pipes, etc.; 2, one amending the law for taxing corporations, so as to remove certain ambiguities in its meaning and difficulties in its execution, and making the tax for State purposes one on "franchises and business" instead of capital stock; 3, requiring supervisors to furnish the Comptroller with lists of corporations and joint-stock companies and associations; 4, making provision for the adjustment of the corporation tax in the city of New York, so as to avoid a double assessment; 5, exempting American vessels engaged in foreign commerce for a term of fifteen years; 6, taxing foreign bankers on their capital used in this State, and making the act for the assessment of bank shares conform to the judicial decisions in regard to deductions on account of debt; 7, relating to the Tax Commission in New York city; and, 8, providing for the

taxation of collateral inheritances and corporate trust mortgages. Among the defeated bills was one for "equalizing assessments and taxation," which was intended to make assessment reach all classes of personal property, and to prevent evasion; one providing for a revenue from a variety of business licenses; and others taxing brokers' sales, trust companies, savings-banks, and life insurance. The commission, after careful consideration, advised against an abolition of deduction for debt from the assessment of personal property. In making a report to the Governor of the results of their labors the members of the Advisory Commission stated that they had made no attempt to devise a complete and symmetrical system of taxation, but suggested that such an attempt ought to be made. They said: "The machinery of taxation should be carefully reconstructed and made more efficient, so as to reach every species of taxable property, and to more equally and justly apportion and collect its proper contribution. The various kinds of taxable property should be exactly defined. Exemptions for indebtedness should be abolished, or made uniform and equal as to every species of property. Mechanical and manufacturing industries should be carefully studied upon their statistics, with a view to their total or partial inclusion for, or exemption from, taxation. The data should be carefully collected for a wider imposition of excise taxes. Careful provision should be made to guard effectually against evasions of taxation, and to define what property and business of domestic corporations, outside of the State, are taxable. And, finally, after proper legislation embracing these various subjects has been perfected, the body of the tax laws should be codified, so as to be conveniently accessible to those charged with their administration."

A bill creating a Railroad Commission, substantially the same as that reported by the Hepburn Committee of 1879, was introduced in the Assembly by Mr. Duguid, and passed that body by a vote of 74 to 33. In the Senate it was held for several weeks by the Railroad Committee, and finally an adverse report was made. It was nevertheless taken up for consideration, but, after several spasmodic efforts had been made in its behalf, it was left without final action when the session closed.

The State canals occupied considerable attention. After some discussion a resolution was adopted in the Senate recommending the removal of all tolls from West-bound freight and putting salt on the free list. This recommendation was adopted by the Board of Canal Commissioners. After much discussion and two reconsiderations of adverse votes in the Senate, a resolution proposing an amendment of the Constitution abolishing all tolls and providing for the maintenance of the canals by taxation was finally adopted. Projects for enlarging and improving the Erie Canal, and one

for the construction of a railroad on the berme bank, were considered but not adopted.

The Western Union, American Union, and Atlantic and Pacific Telegraph Companies, having entered into an agreement which consolidated them all in the Western Union, and provided for a large increase of the stock of that corporation, an effort was made to prevent its consummation by legislative prohibition covering all similar schemes of consolidation. A bill for the purpose was passed in the Assembly, but action upon it was delayed in the Senate until the terms of the agreement had been carried into effect, and it was then abandoned altogether.

A subject which occupied considerable attention for a time was that of providing a new system of street-cleaning for the city of New York. This work had previously been under the charge of the police department of the city, but had been so unsatisfactorily done that a committee of twenty-one was appointed at a public meeting to secure a change of method. This committee prepared a bill, placing the work in immediate charge of the mayor, with power to appoint a superintendent and exercise full control. This was promptly passed by the Senate but was vigorously opposed in the Assembly, on the ground that it placed the control of appointments and employments in the hands of the mayor without restriction, and these might be used for political ends. A measure was finally passed, creating a Department of Street-Cleaning, under a commissioner to be appointed by the mayor and confirmed by the Board of Health of the city.

Efforts made to secure important amendments of the charter of New York city came to naught. All attempts to modify the excise laws also failed. A new penal code was adopted, and important amendments were made in the Code of Civil Procedure. Two bills were passed with a view to providing means for the support of the Emigration Commission. One of these established an inspection of immigrants at the port of New York, and the other provided for a tax of \$1 per head on all immigrants landed, to be collected from the steamship companies by the Commissioners of Emigration. The validity of this act was contested by the companies, and it was declared unconstitutional by the Circuit Court of the United States early in 1882. In his decision, Judge Blatchford took the ground that the inspection which States are authorized to exercise could apply only to imported merchandise, and the tax which they may levy to meet its expense could be placed only upon commodities. This legislation was therefore void, as interfering with the exclusive jurisdiction of the Federal Government over the regulation of foreign commerce.

Considerable dissatisfaction was felt with the results of the session, the effect of which was seen in the political canvass of the year. The revision of the tax laws, which had occupied a

good deal of attention for two years, was left very incomplete; nothing was done for the solution of the question of railroad regulation, and reform in the administration of the affairs of New York city was defeated. The political canvass may be said to have opened at the very beginning of the year, with the initial movements for the reorganization of the Democratic party in the city of New York. The defeat of the party in the State and consequently in the nation, in 1880, was by many attributed to the action of the Tammany organization, under the lead of Mr. John Kelly. A mass-meeting was held at the Cooper Institute, near the end of December of that year, to consider the subject of reorganization. Resolutions were adopted in favor of such a movement, and to carry it out a committee of fifty was chosen, which was subsequently increased to one hundred. A plan was reported in August which provided for elections in each of the Assembly districts of the city, the polling to be conducted in all the separate election districts, for the purpose of choosing local committees and delegates to the County Committee. The object was to base the organization on the action of the mass of the voters of the party, and take it out of the control of the "halls." The new organization was known as the County Democracy, and prepared to contend with both the Tammany Hall and the Irving Hall factions for recognition in the State Convention, and for the control of party interests in the city.

Out of the agitation for the regulation of railroads sprang an association known as the Anti-Monopoly League, which proposed to exercise an influence over the election of members of the next Legislature. A conference called by its officers was held at Utica on the 18th of August, at which an address to the people and a declaration of principles and purposes were adopted. The address set forth the evils and abuses that had sprung up in railroad management and the failure of the Legislature to provide a remedy for them, and was prefatory to the following:

We earnestly recommend that at the next election candidates for legislative office, and especially candidates for the Senate, be chosen regardless of party affiliations, and that only candidates who will pledge themselves to support the following anti-monopoly principles and objects should receive the suffrages of the people:

OUR PRINCIPLES.

Anti-monopoly: we advocate, and will support and defend, the rights of the many as against privileges for the few.

Corporations, the creations of the State, shall be controlled by the State.

Labor and capital: allies, not enemies; justice for both.

OBJECTS.

In accordance with these general principles we will endeavor to secure, among others, the following specific results:

1. Laws compelling transportation companies to base charges upon cost and risk of service, instead of the new theory enunciated by them, "what the traffic will bear."

2. Laws to prevent pooling and combinations.

3. No discrimination against any citizen or any class of citizens on public highways.

4. A Board of Railroad Commissioners for this State, to give effect to the laws which are or may be placed upon the statute-books.

5. Laws making it the duty of public law officers to defend a citizen's rights against injustice by powerful corporations.

6. Laws to prevent the further watering of stock and other devices, by which a fictitious value for public highways is created.

7. Stringent laws against bribery, including the prohibition of free passes.

8. Amendments to our election laws which will better secure to the people the power to select candidates for office.

9. A liberal policy toward our canals, which, during the season of navigation, are potent in preventing exorbitant charges by railroads.

10. Laws providing for the restriction within proper limits of corporate powers and privileges generally, and for the protection, education, and elevation of the masses.

Resolved, That in order to give effect to and enforce the observance of these principles and objects, an organization of the people on a non-partisan basis is absolutely necessary; that in every Assembly district farmers' alliances or anti-monopoly leagues should be organized; that we advise the voters of the State of New York in the coming fall election to vote only for such legislators as will openly pledge themselves to vote for a Board of Railroad Commissioners for the State of New York, and also to sustain generally the principles of the so-called "Hepburn bill."

Resolved, That we make no war upon corporations as such, nor upon any legitimate interest or industry, but that experience has shown that such organization is necessary to resist the aggressions of corporate monopolies and to maintain the public rights as expressed in the Constitution and interpreted by the Supreme Court of the United States, and for this object we pledge our earnest efforts regardless of party affiliations.

Resolved, That the discriminations of the railroads, the improvement of the Mississippi River, and the enlargement of the Canadian canals all admonish the people of this State that their canals should be modernized and made equal to any competition which they may have to sustain; and we therefore declare that the water-ways of the State should be enlarged and made free of tolls.

Resolved, That the State, having delegated to railroad and telegraph corporations its duty of maintaining public highways and intercommunication among the people, is bound to control said corporations in the interests of the public, or reassume the functions so delegated; that the direct tendency of the abuses in our transportation system is to nullify the principle upon which our government is founded; that instead of the distribution of wealth, they tend to make a few very rich and the many poor; that the feudalistic tendencies of the age are very marked, and prompt and vigorous efforts are necessary to check this rapidly growing evil.

Resolved, That the American public, and especially the people of this State, are not yet ready to acknowledge that there is a dominant privileged class, to which all the rest of the community must pay tribute; that every barrel of flour, every gallon of petroleum, every ton of coal, and other necessities of life must be depreciated to the producer or unduly enhanced to the consumer, in order that the few may live in undue luxury at the expense of the many. We have faith that the intelligence and patriotism of the American people will be equal to the emergency of controlling the creatures of their creation, and we invoke the influence of every good citizen, and we will organize and work to this end.

The Greenback party held a convention at

Elmira on the 24th of August, nominated a State ticket, adopted a platform, and chose the members of a new State Committee. The candidates nominated were: for Secretary of State, Epenetus Howe, of Tompkins County; for Comptroller, John Hooper, of New York; for Attorney-General, Dennis C. Feeley, of Rochester; for Treasurer, Allen C. Wood, of Steuben County; for State Engineer, James H. Gould, of Cattaraugus County; for Judge of the Court of Appeals, Lawrence G. McParlin, of Lockport.

After a preamble denouncing the conduct of the other parties in dealing with public interests, and approving the platform of the National Greenback-Labor party adopted at Chicago, June 9, 1880, the following was adopted as a fresh declaration of principles:

1. That all money paid to railroad companies for transporting persons or property in excess of what is required to pay the legitimate expenses of operating such roads and a fair return on their actual cost, is in violation of the fundamental law of public use which allows railroads to be built, and should immediately be prohibited by legislative enactment.
2. That railroad companies should be prohibited by law from charging more for transporting property during the season when water navigation is closed than they charge for like services during the season of open-water navigation.
3. That we work for the lawful suppression of any traffic or custom that encourages crime.
4. That this convention recognizes the National Greenback party as the original anti-monopoly organization of the country, and, as such, extends the hand of sympathy to the anti-monopoly leagues for the public service they are rendering in educating the people on one of the questions contained for years in our platform.

Among the miscellaneous resolutions offered by various delegates, reported back by the committee on resolutions and adopted, were the following:

Resolved, That the Government should exchange its legal-tender notes for any of its interest-bearing debts at par on demand, and for gold or silver bullion or coin at their legal weight values.

Resolved, That we recognize the fact that all chief executive officers should have entire control of the selection and appointment of their assistants, to the end that the administrative machinery may work harmoniously; but, for the purpose of relieving both State and national politics from the odium of executive interference, we demand that all persons performing executive service for the State or General Government shall be deprived of the elective franchise during the period of such service.

Resolved, That we protest against the proposed sale of public lands in Minnesota, as advertised by the Secretaries of the Treasury and Interior, except to actual settlers, and in parcels not exceeding 120 acres.

Resolved, That as the Irish people are battling for the same rights that are gradually being wrested from us, we extend to them and all others our sympathy and aid, and bid them godspeed in their battle against tyranny.

The Republican canvass was materially affected by the senatorial contest of the spring and early summer, which had developed a degree of antagonism between what were variously known as the Conkling and anti-Conkling, the "Stalwart" and "Half-Breed," and the "Ma-

chine" and "Anti-machine" wings of the party. The State Committee, consisting of one member for each of the thirty-three congressional districts, held a meeting in New York city on the 31st of August. The majority of this body was made up of supporters of Mr. Conkling, and Thomas C. Platt was chosen for its chairman *pro tem*.—Chester A. Arthur, the regular chairman, being absent. A call was issued, designating New York city as the place and the 5th of October as the time for the State Convention, and presenting an apportionment of delegates, 496 in all, among the several counties. When the delegates gathered at New York on the eve of the convention, it was evident that the anti-Conkling element largely preponderated. The convention was held in the Academy of Music, and was largely attended. General George H. Sharpe proposed Frank Hiscock as temporary chairman, but he declined to have his name used, and Warner Miller was proposed by T. M. Pomeroy. The yeas and nays were demanded, and resulted in 298 affirmative to 190 negative votes, which was an indication of the relative strength of the Conkling and the anti-Conkling elements in the convention. Mr. Miller delivered an address on what he regarded as the questions of the time, and committees on credentials, resolutions, and permanent organization were appointed by the Chair, after General Sharpe had presented a list of members for the first-named committee for the purpose of making an explanation in behalf of himself and his "Stalwart" associates. There were several contesting delegations, and the report of the committee on credentials resulted in unseating 23 Conkling men and seating 19 anti-Conkling men. The report of the committee on permanent organization, which was adopted without opposition, made Channey M. Depew the permanent chairman. The nominations were then made, as follows: For Secretary of State, General Joseph B. Carr, of Rensselaer County; for Comptroller, Ira Davenport, of Steuben County; for Attorney-General, Leslie W. Russell, of St. Lawrence County; for State Treasurer, General James W. Husted, of Westchester; for State Engineer and Surveyor, Silas Seymour, of Saratoga County; for Judge of the Court of Appeals, Francis M. Finch, of Tompkins County.

The following platform was adopted:

The Republicans of New York declare as follows:

1. That we unite with our fellow-citizens throughout the Union in deploring the incalculable calamity which has befallen the country in the death of the late President, James Abram Garfield. Under the kindly influence of American institutions, and by the force of noble manhood, he rose from the humblest walk of life to the highest earthly station. By manliness and gentleness of nature; by loftiness of public spirit and disciplined intelligence for public affairs; by strength of political conviction, blended with singular moderation of temper and urbanity of expression—above all, by that rare and noble temper which dares to be just, and which alone composes angry states, reconciles parties, and secures wise reform—he

was singularly fitted for the great office to which he was elevated by the free choice of his fellow-citizens. The opening of his Administration had won the confidence of the country by completing the refunding of the public debt, by exposing a vast system of public robbery, and by hastening the prosecution of the robbers, by its frank declaration of the intention to ask the aid of Congress to restore the conduct of the public business to business principles, and by its triumphant vindication of the constitutional authority of the executive office. Suddenly stricken by a mortal blow, he lay face to face with death for eighty days, with such sublime serenity of courage, unquailing faith, cheerful patience, and gracious courtesy, that the heart of Christendom beat with sympathy and admiration, and brought every nation to our side as friends and brothers. Already his name shines among the world's heroes, and it is written upon American hearts with the names of Washington and Lincoln. Cherishing the memory of his brave, simple, manly character, inspired by his lofty aims and unsullied life, and impressively warned by the circumstances of his assassination, we pledge ourselves anew to the great national objects to which the late President was devoted, and which are now bequeathed to the party that he so patriotically served, and of whose name and fame he was so justly proud. We respectfully offer to the venerable mother, the devoted wife, and the bereaved children of the late President the assurance of our deep and tender sympathy in a sorrow which only divine power can console, but which has all the alleviation that the spotless memory of the dead, the tearful gratitude of the country, and the sincere grief of the world can afford.

2. That we have entire confidence in the ability, integrity, and patriotic intentions of Chester A. Arthur, President of the United States; that his lifelong record gives earnest of his fidelity and devotion to the cause and principles of the Republican party; and, believing that he will carry out the views expressed by him in his inaugural address, and that his Administration will be in line with that of his lamented predecessor, in accord with the clearly defined principles and policy of the Republican party, and in harmony with the just expectations of those who gave him their suffrages for the high and responsible office to which he was elected, we tender to him our entire confidence and cordial support. His manly bearing and sympathetic acts in the time of national affliction command our respect and admiration.

3. That the triumphs of Republican management of the national finances are being constantly maintained, as shown by the payment of more than \$17,000,000 of public debt during the month of September, and by the reduction of the annual interest to less than \$62,000,000, while the surplus revenues justify the reduction of the taxes at an early day; and that this duty Congress should approach with due regard to the protection of American industry, and with the aim to reduce the number of tax-gatherers, and remove occasion for offensive and costly litigation.

4. That those who conspire to defraud the Government are the worst enemies of the party to which they belong, and the Republican party has among its strongest claims to popular gratitude the war which it has waged against the corruption which grew out of the expenditures consequent on the rebellion, the punishment which it has meted out to dishonest officials of whatever rank, and its persistent vigor in favor of economical and honest administration. The prosecution of the abuses connected with the Star Routes in the Post-Office Department redounds to the credit of President Garfield, and, in pressing the prosecution to the full satisfaction of justice, President Arthur may be assured of the hearty approval of the people.

5. That we pledge President Arthur our earnest support in every effort for the enforcement of civil-service reform, recognizing as we do the fact that abuses in connection with the dispensation of official patronage may be largely eliminated, if not wholly

removed, by wise and practicable methods of administration.

6. That the wisdom, prudence, and economy shown by Governor Alonzo B. Cornell, during his administration of the affairs of the State, entitle him to the thanks and gratitude of the people. His careful scrutiny of legislation, his judicious exercise of the veto power, his persistent enforcement of the principles of retrenchment, and his fearless discharge of all the duties of his office, have, in the development of the best qualities of practical statesmanship, vindicated the wisdom of his election.

7. That, as the Republican party has always been identified with whatever was deemed essential to the maintenance of the commercial supremacy of the State, we are in favor of submitting to the people the question of making our canals perfectly free.

8. That we are in favor of an equitable system of taxation that will reach corporations as well as individuals, and that we are opposed to all monopolies that oppress the people or unfairly discriminate against local interests.

An additional resolution in favor of the establishment of a Board of Railroad Commissioners was adopted; also the following:

Resolved, That we accept the conciliatory spirit that has characterized the proceedings of this body as a harbinger of enduring harmony and permanent success. The ticket nominated is made up of men of proved integrity and tested patriotism. They are deserving of popular confidence, and will discharge the duties of the several offices for which they are named with conscientious fidelity to the people and to the State.

An effort to secure a reorganization of the party in New York city under the direction of the State Central Committee was defeated. A new State Committee was chosen, the delegates from each district designating its representative. This placed the control of that body in the hands of the wing of the party which had directed the proceedings of the convention.

The Democratic State Committee held a meeting in New York city on the 7th of September, and decided upon the holding of a State Convention at Albany on the 11th of October, to be made up of three delegates from each Assembly district. The new organization in the city of New York had been completed, the practical work of the Committee of One Hundred being carried on by a sub-Committee of Twenty-One. Efforts to secure the co-operation of the Tammany Society had failed, and, when it was proposed in behalf of that body that the two organizations combine in sending delegates to the Albany Convention, answer was made by the following resolution, adopted by the General Committee of the County Democracy:

Resolved, That the chairman and secretary of the organization be instructed to reply, in substance, that in this organization no central committee or authority has anything whatever to do with the election of delegates to the State Convention; that the time has happily come when no committee can meet and deal with Tammany Hall, upon this or any kindred subject; that the Democrats throughout the city will meet and select delegates to the State Convention at primary meetings under a call as broad as the Democratic party; and the chairman and secretary are instructed to express the regrets felt by the County Committee

of the New York County Democracy that Tammany Hall did not, when invited to do so by the Committee of One Hundred in January last, co-operate with that committee in the creation of a popular organization of the party now representing it in the various districts throughout the city, and to express the hope that, when the Assembly district committees are next elected, Tammany Hall will show its desire for union and harmony in the party by urging all Democrats to go in together at the primaries, where union can alone be effected, and, not as before, refuse to participate in the creation of a united party organization.

A final report of the sub-Committee of Twenty-One, of which Abram S. Hewitt was chairman, was made on the 7th of October. It gave an account of the different steps taken, from the holding of the mass-meeting in December, 1880, until the final completion of the organization in these several Assembly districts and in the county of New York as a whole. When the convention met in Albany, on the 11th of October, the first day was occupied with the temporary organization and the appointment of committees. There were contesting delegations from all the New York districts, but those representing the County Democracy were placed on the preliminary rolls, and the committee on credentials, after a protracted hearing, reported in their favor on the second day of the convention. The chairman of the committee, in submitting the report, said: "After the hearing, the committee, by a unanimous vote, find that the gentlemen now occupying seats in this convention on the preliminary roll were entitled to permanent seats, by virtue of their regularity as delegates from the county of New York." This being adopted, both the Tammany and Irving Hall Associations were excluded from representation in the convention, and debarred from all claims to regularity as part of the Democratic organization of the State.

Erastus Brooks, of Richmond County, was chosen permanent chairman of the convention. The platform adopted was as follows:

The Democratic party of New York again declares its fidelity to the principles set forth by the New York State Democratic Conventions of 1874, 1875, and 1876, which were thrice approved at the ballot-boxes by the people of the Empire State, and were vindicated by the wise administrations of the Democratic State Executives then chosen, and to the principles set forth by the National Democratic Convention at St. Louis, which were approved by decisive popular and electoral majorities in the presidential election of 1876. The victories then won in this State and in the United States were in the name and for the sake of reform.

The people were defrauded of the fruits of victory in the Federal election by the false count of the electoral votes in 1876, and the flagrant corruption in the election of 1880. Reform throughout the Federal Administration is still a necessity. The continuing disclosures of now and hitherto concealed plundering of the people's funds by inner rings in the Treasury, the Post-Office, and the Interior Departments, demonstrate that reform is now more than ever a necessity.

It remains for the National Democratic party to restore the Federal Government to the fraternal spirit, the constitutional principles, the frugal expenditure, and the administrative purity of the fathers of the republic.

It remains likewise for the Democracy of the State of New York, and is their first political duty, to resume and carry on to a successful completion in all departments of its government the great measures and policy of administrative reform which, between 1874 and 1876, reduced by one half the burden of our State taxation, and which then, and during the three succeeding years, established throughout its executive departments vigor, economy, and fidelity to public trusts.

To that immediate duty this convention pledges the united efforts of the Democracy of New York, and the loyal devotion of the nominees whom it shall commend to the choice of their fellow-citizens.

The assassination of the late President of the United States was a crime against authority, against free institutions, and against humanity. We deplore and denounce the crime in all its public and private aspects. We extend, as citizens, our most profound condolence to the family of the murdered Chief Magistrate, and regard with great gratification the universal expressions of sympathy extended by all nations and peoples.

We renew the expression of our demand for the re-funding of the national debt at the lowest possible rate of interest.

The New York Democracy, as always, stands by gold and silver as the legal tender of the Constitution, and by the doctrine that all paper mediums of money must be based on those metals as the standard values of the world.

We demand the payment, principal and interest, of every dollar of public indebtedness.

"Readjustment" is repudiation. The act of the Northern Republican leaders, in giving the support of that party to repudiation in Virginia, Mississippi, Minnesota, and other States, is a national disgrace, dangerous as a precedent and destructive of the public credit.

We call upon the Democrats in Congress to maintain the standard of retrenchment by which their Democratic predecessors reduced the Federal expenses \$40,000,000 in a year.

We demand a thorough and immediate investigation into the Star Route and other frauds upon the Federal Treasury, and a vigorous prosecution, already too long delayed, of all the participants, both high and low, in these grave crimes, whereby the moneys of the people were stolen from the Treasury and the plunderers were made to provide a corruption fund, which was used to carry the last presidential election for the Republican party.

We indorse and applaud the united and honest action, for Democratic principles and candidates, of the fifty-four Democratic members of the last Legislature. They honored their State, their party, and themselves. We denounce the Republican majority, because that majority defeated every measure of transportation reform, at the bidding of its masters, the corporations. It enacted jobs directly increasing the public burdens by millions. It failed to meet the urgent question of assessment and taxation reform. It refused the demand of the State for a feasible and enforceable excise law. It left the farmers of New York, where the action of the Governor placed them, at the mercy of the oleomargarine ring. It struck hands, for political greed, with the abettors of disease and death in the metropolis. It prolonged the session of the Legislature far into the summer, at an aggregate expense of \$300,000 to the people. It became, in a fictional struggle of placemen, the participant in scandals and crimes which brought dishonor and disgrace upon the good name of our State. When the Republican Legislature adjourned the people rejoiced, as if delivered from a pestilence, and the officers of the law were obliged to begin the work of prosecuting the bribes and perjuries committed by corrupt leaders of that party while plying their vocation in the capital of the State.

We are in favor of such a reform by legislative

enactment, as well as by administrative action, in the civil service of the country, as will substitute for the present periodical scramble for spoils, a wise system of appointment and promotion, by which the incumbency of subordinate offices shall be regulated by law and depend only upon capacity and character, and demand that no assessments shall be levied upon public officers for political purposes.

The public welfare demands that the various questions relating to chartered monopolies and the methods of transportation should be met and decided, and we are in favor of the adoption of measures to restrict the growing power of such monopolies. They should be subject to the supervision of commissioners established by public authority. All unjust discriminations in the transportation of passengers and merchandise should be prohibited. The charges of corporations which have taken the property of private citizens for public use, should be limited to the cost of service, with a reasonable profit, instead of the mercenary exaction of "all the traffic will bear." We approve of the unanimous action of the Democratic members of the last Legislature in providing for the early submission to the people of an amendment to the Constitution in favor of free canals.

The Democratic party, now and always unalterably opposed to centralization of power in either the State or Federal Governments, hereby requests its representatives in the Legislature to promote and make effective an amendment to the Constitution which shall extend the principle and the powers of local self-government to the cities of the State.

To the record of the Democracy of New York we point with confidence. We challenge a comparison of its record with that furnished by the factions which were once the Republican party of this State. To the candidates of this convention we pledge a hearty support, and we confidently submit our action, as the representatives of a free Democracy, to the good people of this Commonwealth for their verdict at the polls.

The candidates put in nomination were: For Secretary of State, William Purcell, of Monroe; for Comptroller, George H. Lapham, of Yates; for Attorney-General, Roswell A. Parmenter, of Rensselaer; for State Treasurer, Robert A. Maxwell, of Genesee; for State Engineer and Surveyor, Thomas Evershed, of Orleans; for Judge of Court of Appeals, Augustus Schoonmaker, Jr., of Ulster.

The election took place on the 8th of November. During the canvass considerable opposition had been displayed in the Republican ranks to James W. Husted, the candidate for Treasurer, and there had been numerous divisions in the nomination of candidates for members of the Legislature. The Anti-Monopoly League used its influence for or against legislative candidates, according to their position on the railroad question; and in New York city the various Democratic factions made separate nominations in several districts. The result of the vote for Secretary of State was 416,915 for Carr, 403,893 for Purcell, and 16,018 for Howe—total vote, 842,763; plurality of Republicans over Democrats, 13,022. The vote for Comptroller was slightly larger, the total being 843,107, and the Republican plurality 14,084. For Treasurer Mr. Husted was defeated; the total vote was 831,836; for Husted, 392,251; for Maxwell, 413,194; for Wood, 15,499—Maxwell's plurality, 20,943. The rest of the Republican ticket was elected.

Congressmen were chosen in four districts to fill vacancies. In the ninth district, New York city, John Hardy, Democrat, was elected over Thomas Murphy, Republican, by 5,308 plurality, for the seat made vacant by the death of Fernando Wood. In the eleventh, also in New York city, Roswell P. Flower, Democrat, was elected over William W. Astor, Republican, by 3,113, to the seat made vacant by the resignation of Levi P. Morton, appointed Minister to France. In the twenty-second, Charles R. Skinner, Republican, was elected over John Lansing, Democrat, by 3,154, to the seat made vacant by the resignation of Warner Miller, transferred to the United States Senate. In the twenty-seventh, James W. Wadsworth, Republican, was elected over James Faulkner, Democrat, by 2,486, to the seat vacated by E. G. Lapham, also transferred to the Senate. The Legislature chosen consisted of 17 Democrats and 15 Republicans in the Senate, and 67 Democrats and 61 Republicans in the Assembly, giving the Democrats a majority in both branches for the first time in twelve years. Three of the Democratic Senators and 8 of the Democratic Assemblymen had been elected in New York city as candidates of the Tammany Society, which gave that body the balance of power between the two regular parties in the Legislature of 1882. An incident of some interest in the election was the choice of Mr. Seth Low for Mayor of Brooklyn. Amendments in the charter of that city gave the mayor full power to appoint and remove the heads of all departments in the municipal administration, and a vigorous effort was made to secure the election of a man who would exercise this power independently, and without subservieny to any political organization. Mr. Low was the candidate selected with this view by independents of all parties, and he received the support of the Republicans, their regular candidate having withdrawn.

The following statement exhibits the finances of the State for the year ending September 30, 1881:

Aggregate balances October 1, 1880.....	\$3,448,215 28
Aggregate receipts during the fiscal year.....	14,940,403 90
Total.....	\$18,388,619 28
Payments during the year.....	12,556,760 57
Balance September 30, 1881.....	\$5,831,858 71
Receipts on account of the general fund during the year.....	8,751,084 80
Payments.....	6,966,870 01
Apparent surplus.....	\$1,764,664 79
Balances due from county treasurers on State tax of 1880.....	247,025 47
Amount paid on account of 1881, included in tax levy payable in 1882.....	1,021,272 51
Total surplus.....	\$3,032,962 77
Deduct balances of 1880, appropriations unpaid.....	533,347 50
Actual surplus September 30, 1881.....	\$2,499,615 27

On the 30th of September, 1880, the total funded debt was \$9,114,054.87, classified as general fund, Indian annuities, canal and bounty debt, viz.:

General fund (Indian annuities).....	\$122,694 87
Canal.....	8,983,360 00
Bounty.....	5,000 00
Total.....	\$9,114,054 87

On the 30th of September, 1881, the total funded debt was \$9,109,054.87, classified as follows:

General fund (Indian annuities).....	\$122,694 87
Canal.....	8,983,360 00
Bounty.....	5,000 00
Total.....	\$9,109,054 87
Balance in the canal sinking-fund.....	2,422,981 57
Canal debt unprovided for.....	6,560,375 43
State debt September 30, 1880, after deducting the unapplied balances of the sinking-funds.	7,039,574 70
On September 30, 1881.....	6,639,073 30
Net contributions to sinking-fund.....	\$376,501 40
Actual reduction of the debt by cancellation..	5,000 00

The assessed value of property in the State is \$2,681,257,606, of which \$2,340,335,690 is real estate, and \$340,921,916 personal property. According to competent authority, the actual value of personal property does not differ materially from that of real estate in any industrial or commercial community, and the apparent disparity is due to the imperfect assessment of the former. The rate of taxation for State purposes for the fiscal year 1881-'82 is 2½ mills on the dollar, of which 1-⅙ mills is for schools, ⅙ for general purposes, and ⅙ for canals. The yield of the State tax, if fully collected, will be \$6,032,829.61. The rate of taxation is the lowest since 1856. The year was a very unfavorable one for the State canals, owing in part to a falling off in the bulk of grain transportation from the West, and in part to the unusual competition between the trunk-lines of railroads, which reduced their rates far below the normal level. In 1880 there were 6,457,656 tons moved on the canals; in 1881 only 5,175,505. The rates were also lower than usual—4-⅙ cents per bushel for corn, and 4-⅙ for wheat. Deducting State tolls, 1-⅙ cents for wheat and ⅙ for corn, the return for the carrier was but \$1.28 per ton from Buffalo to New York. The westward movement, notwithstanding the removal of tolls, was only 1,365,418 tons against 1,518,290 in 1880. The revenues of the canals amounted to \$818,264.61, while the expenses were \$1,023,907.06.

On the 31st of December, 1880, there were 161 fire-insurance companies doing business in the State, of which 86 were New York State companies, 53 of other States, and 22 foreign, with total assets of \$146,398,641; liabilities, including capital stock, \$97,784,334, and net surplus, \$48,614,307. These companies received during the year a gross cash income of \$66,420,034, and their gross cash expenditure was \$60,925,644. During the year six other State and three foreign fire-insurance companies were admitted to transact business in this State. Four New York fire-insurance companies discontinued business and re-insured their risks, and three other State companies withdrew their agencies and ceased to do business

in the State. Twelve life-insurance companies, organized under the laws of New York, were in operation, with aggregate assets of \$214,647,574; liabilities, \$177,357,829; surplus, \$37,289,744. Of other State life-insurance companies, 18 were conducting business in this State, having assets of \$203,303,435; liabilities, \$169,031,510; and surplus to policy-holders, \$34,271,925. Of marine-insurance companies, 18 were transacting business in this State; of which 10 were foreign, 6 New York, and 2 other State companies, with assets amounting to \$21,315,263, and a net surplus of \$4,443,177. There were also two New York and two other State casualty companies, doing business, with \$2,112,022 assets, and \$843,004 surplus. Securities for the protection of policy-holders insured by the various insurance companies doing business in this State, of the kind and amount required by statute, were held on deposit by the Insurance Department on the 31st of December, 1880, as follows:

New York State Life.....	\$3,977,560
New York Casualty.....	201,426
New York Fire.....	1,562,000
Other State Fire.....	20,100
Foreign.....	7,060,000
Aggregate.....	\$12,821,086

On October 1, 1881, 72 banks of discount and deposit were engaged in active business, under the provisions of the State banking laws, and their condition was as follows:

Resources.....	\$113,463,572
Capital.....	19,025,700
Surplus and profits.....	8,928,175
Due depositors.....	75,717,130
Other liabilities.....	9,792,567

During the year deposits increased \$13,921,357; profits, \$869,895; loans and discounts, \$11,242,376. The net aggregate increase in assets was \$13,612,817. Five new banking associations organized during the year, and one changed from a State to a National bank; leaving four as the net increase in number of associations.

One hundred and twenty-eight savings-banks reported July 1, 1881; 11 of which were in process of voluntary liquidation and did not receive deposits. No savings-bank closed during the year. In July a certificate of authorization was granted for a savings-bank in Buffalo, that being the only one organized since 1875. The condition of the savings-banks on July 1st was as follows:

Resources.....	\$424,204,808
Due depositors.....	370,672,297
Surplus.....	53,803,853
Other liabilities.....	229,127
Number of open accounts.....	995,742

The increase in the several items during the year was as follows:

Resources.....	\$47,998,563
Deposits.....	85,210,727
Surplus.....	12,759,929
Open accounts.....	82,579

There are thirteen trust, loan, and mortgage companies in operation in the State, owning \$130,000,000 assets. The aggregate capital em-

ployed is \$12,000,000. During the year one new trust company organized. There are ten corporations for the safe-keeping and guaranteeing of personal property, two of which organized during the year; the capital invested being \$1,976,900.

The total amount of salt inspected on the Onondaga salt springs reservation for the fiscal year ending September 30th, was 7,633,394 bushels, and the financial operations of the agency were as follows:

Duties collected.....	\$76,334 47
Penalties, rents, and sales.....	130 00
Total receipts.....	\$76,464 47
Expenses incurred.....	59,470 24
Surplus revenue.....	\$16,994 23

The following are the common-school statistics for the year ending September 30th:

Total receipts.....	\$11,954,715 03
Total expenditures.....	10,508,802 40
Amount paid for teachers' wages.....	7,775,505 22
Amount paid for school-houses, repairs, furniture, etc.....	1,467,361 00
Estimated value of school-houses and sites.....	31,091,630 00
Number of school-houses.....	11,894
Number of school districts, exclusive of cities.....	11,248
Number of teachers employed for the legal term of school.....	20,723
Number of teachers employed during any portion of the year.....	30,826
Number of children attending public schools.....	1,021,282
Number of persons attending normal schools.....	5,944
Number of children of school age in private schools.....	103,309
Number of volumes in school-district libraries.....	707,155
Number of persons in the State between the ages of five and twenty-one years.....	1,662,818

Reports received by the Regents of the University were from 22 literary colleges, comprising 388 instructors, 4,389 students, and representing property to the amount of \$17,240,400; also returns from 236 academical institutions, with 1,182 instructors and 31,036 pupils.

For the first time in their history, the State Prisons were self-sustaining during the year. The earnings of the convicts were sufficient for current expenses, leaving a small balance to the credit of the prisons. The average number of prisoners confined at Auburn, Clinton, and Sing Sing, in the last four years, was as follows:

1873.....	3,379	1830.....	2,970
1879.....	3,062	1881.....	2,997

The following statement shows the amount of the earnings and expenditures on account of the several prisons for the fiscal year:

SING SING.			
Earnings.....	\$220,254 14		
Expenses.....	187,127 20		
Surplus.....	\$42,126 94		
AUBURN.			
Earnings.....	\$113,638 63		
Expenses.....	118,781 85		
Deficiency.....	\$5,123 22		
CLINTON.			
Earnings.....	\$61,443 14		
Expenses.....	97,882 51		
Deficiency.....	36,439 37		
	\$41,562 59		
Actual surplus for the year.....	\$564 35		

The average number of inmates in the Elmira Reformatory was 492. The cost of maintenance was \$40,860.37. Thirty acres of land have been purchased for \$3,000, within the corporate limits of the city of Hudson, for a House of Refuge for Women, and \$100,000 has been appropriated for the establishment of the institution. Expenditures in behalf of the institutions under the supervision of the State Board of Charities amounted to \$9,360,300, derived from the following sources:

State of New York.....	\$918,044
Cities and counties.....	4,707,314
Labor of inmates.....	126,978
Paying patients.....	268,669
Donations.....	1,152,754
Income of invested funds.....	879,216
Loans.....	668,892
Non-enumerated sources.....	1,148,983
Total.....	\$9,360,300

Expenses were divided as follows:

State institutions.....	\$1,571,641
County poor-houses.....	1,170,842
City almshouses.....	1,117,573
Orphan asylums and other homes.....	4,085,835
Hospitals.....	1,802,158
Dispensaries.....	161,946
Total.....	\$9,360,300

The constantly increasing number of insane persons is exhibited by the following statement of the number of inmates of the various State and local asylums, poor-houses, and private asylums, for the past five years:

October 1, 1881.....	10,059
" 1880.....	9,537
" 1879.....	9,015
" 1878.....	8,781
" 1877.....	7,921

The new Asylum for the Insane at Binghamton has been brought into use during the past year, and contains a considerable number of patients.

The number of immigrants landed at Castle Garden from January 1st to December 10th was 423,350, and the estimated number at the close of the year was 440,000. The number of arrivals during each of the last ten years was:

YEARS.	Number.	YEARS.	Number.
1872.....	294,581	1877.....	54,536
1873.....	266,813	1878.....	75,847
1874.....	140,041	1879.....	125,070
1875.....	84,560	1880.....	327,371
1876.....	68,264	1881, about.....	440,000

The work of the State Board of Health in abating nuisances, improving the sanitary condition of various localities, diffusing useful information, and promoting the establishment of local organizations, has been of great and generally acknowledged value.

The State Capitol is still unfinished, though it is occupied by the Legislature and executive officers. There was paid on its account during the fiscal year ending September 30th, \$1,392,328.75, and from October 1st to the end of the year \$250,000 was advanced to the commissioners. Of this structure, the State Comptroller, in his annual report, says: "With the

expenditure of this last amount [\$210,000 remaining subject to the draft of the commissioners], the 'magnificent fraud,' as some one has aptly termed it, will have cost the taxpayers of the State, in round numbers, \$13,000,000, and the end is not yet. At the present rate of expenditure its total cost when completed will fully reach \$20,000,000, and when completed it will not meet the wants for which it was intended. Three fifths of the building are taken up in halls and corridors, and, although it covers more than three acres of ground, all the departments of the government can not be accommodated within it, and one or two will be forced to remain in their present quarters. A great many of its lower rooms are dark and damp, and unwholesome; the acoustics of the Assembly chamber are so bad that it is almost impossible to hear any debate; the Court of Appeals hesitates to occupy the chamber assigned it on account of the wretched manner in which it is lighted. Add to this the fact that when completed it will be an annual burden of between \$150,000 and \$200,000 for care and repairs, and that another stone may crack or crumble in the arch of the Assembly and possibly precipitate the whole to the cellar below, and the people of this State have a monument of folly, whose greatest good will be as a warning to future generations to plan well, and to calculate well the cost before building."

A site for an agricultural-experiment station has been selected near the village of Geneva, in Ontario County. Efforts looking to the holding of an International Exhibition in the city of New York have been suspended, but not definitely abandoned. On the 22d of January the obelisk, known as "Cleopatra's Needle," which was presented to the United States Government by the Khedive of Egypt, and brought over by Lieutenant Goringe of the navy, at the private expense of Mr. William H. Vanderbilt, was successfully placed in position in Central Park, New York.

Mayor Grace, of New York city, endeavored to exercise his power of removing three of the Police Commissioners for neglect of duty, the principal allegations against them relating to the cleaning of the streets. After a prolonged hearing he decided upon their removal in the latter part of August, but this action required the approval of the Governor in order to be effective. His approval was withheld on the ground that at the time the mayor's action was taken the power and responsibility of the Police Commissioners in the matter of street-cleaning had been taken away by the new law providing for a separate street-cleaning department.

An incident of some interest in the city of New York was the consolidation of the elevated railroad companies. For two years the roads had been operated by the Manhattan Railway Company under leases from the other two companies which owned the roads, namely, the New York and the Metropolitan Ele-

vated Railroad Companies. Under these leases the first-named company had agreed to pay all charges and expenses, including taxes and interest on bonds, amounting to about \$21,000,000, and to furnish dividends of 10 per cent on the capital stock of \$6,500,000 of each of the other companies. It had also issued and divided between those companies as a further consideration \$13,000,000 of stock of its own, although it had no road and had incurred no expense for construction or equipment, and this stock represented no outlay of capital. Early in this year the Manhattan Company was in default for taxes and dividends, and it was evident that it had assumed a burden which it could not carry. The Attorney-General began suit against it in May for the purpose of effecting its dissolution. The grounds alleged were insolvency, forfeiture of its charter before the leases of May, 1879, were entered into, and illegal action in making those leases, and in increasing the capital stock. In July this suit was abandoned in New York city, and a new one brought before Judge Westbrook, at Kingston, based on allegations of insolvency only. Receivers were appointed and placed in charge of the property and business of the elevated roads. All the companies were involved in litigation during the summer, and the stock was much depressed. The purpose of one of the suits was to recover from the Manhattan Company the property of the New York Company, on the ground that the terms and conditions of the lease had not been fulfilled. There were at the same time intimations of proceedings by the Manhattan for the recovery of its stock, or the par value thereof in money, from the other companies, on the ground that no consideration had been given for it. A decision rendered by Judge Westbrook on the 21st of October denied the claim of the New York Company for the recovery of its property, and intimated that there might be a valid counter-claim for the value of the Manhattan stock. Other decisions, one of them rendered by the United States Circuit Court, held the agreement and leases of May, 1879, valid as against the stockholders, and upheld the doctrine that the boards of direction had power to enter into and modify agreements without the express approval of stockholders. On the 23d of October the old agreement was modified so as to reduce the obligations and payments of the Manhattan Company, which had passed under a new control, and immediately afterward the receivers were discharged and the company's affairs placed in the keeping of its officers and directors. Subsequently still another compact was made whereby the Manhattan Company was to issue \$13,000,000 more of its own stock to be exchanged for that of the other companies, thus practically absorbing them and consolidating the entire system under an undivided control. Serious charges were made that the entire proceedings were virtually directed by

a combination of stock operators, and that the Attorney-General and Judge Westbrook had used their powers to promote the purposes of this combination. The latter was accused of shaping judicial action from first to last in its interest, and of giving important hearings and

rendering decisions in the private offices of the parties interested.

The following table gives the population of the State, by counties, as finally returned by the census of 1880, and as compared with the returns of 1870:

COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.	COUNTIES.	1880.	1870.
Albany.....	154,890	138,052	Herkimer.....	42,669	39,299	Richmond.....	88,991	83,029
Allegany.....	41,810	40,514	Jefferson.....	66,108	65,415	Rockland.....	27,690	25,213

The total population of New York city, as finally returned by the census of 1880, is 1,206,299, including 727,629 native and 478,670 foreign-born. Of the native-born, 708,677 are white, and 18,952 colored. The cosmopolitan character of the population is shown by the following statement of countries of which the foreign-born are natives:

COUNTRIES.	Number.	COUNTRIES.	Number.
Africa.....	57	Italy.....	12,223
Asia.....	119	Japan.....	20

Charles J. Folger, Chief Judge of the Court of Appeals, resigned his office on the 14th of November, to accept the position of Secretary of the Treasury of the United States. The Governor designated Associate Judge Charles Andrews for the vacant place, and appointed Charles L. Benedict, of Brooklyn, to succeed Judge Andrews.

A National Tariff Convention was held in the hall of the Cooper Union, New York city, on the 29th and 30th of November, which was taken up chiefly with a discussion of changes in the national tariff. A declaration in favor of abolishing the internal revenue taxes was defeated. The general purport of the discussion and declarations of the convention was favorable to the maintenance of high protective duties.

NICARAGUA (REPÚBLICA DE NICARAGUA), one of the five independent states of Central America. Lying between latitude 10° 45' and 14° 55' north, and longitude 83° 15' and 87° 38' west, it is bounded on the north by Honduras, on the east by the Caribbean Sea, on the south by Costa Rica, and on the west by the Pacific Ocean. The area of the republic is variously given at from 52,000 to 58,000 square miles, and the population is estimated at 300,000. The northern boundary, with Honduras, is unsettled, but the Coco or Segovia River is generally considered as the dividing line between the two countries; yet in some recent Central American maps that line is placed northwest of the stream first named. The territorial division is into eight departments, which, with their chief towns, are as follows:

DEPARTAMENTOS.	Chief towns.
Managua	Managua.
Granada	Granada.
Leon	Leon.
Rivas	Rivas.
Chinandega	Chinandega.
Chontales	Acayapa.
Matagalpa	Matagalpa.
Nueva Segovia	Ocotail.

The Mosquito Territory, or Reserva Mosquita, a narrow strip of land on the Atlantic coast of Nicaragua, and inhabited by the Mosquito Indians, ruled by a cacique or king, is under the protection of Great Britain.

By the terms of the new constitution, adopted on August 19, 1858, after the filibuster war, Nicaragua is under a popular representative government, the power being divided into three branches—legislative, executive, and judicial. The legislative power resides in a Senate and a Chamber of Deputies, the first composed of ten members, and the second of eleven. The executive power is vested in a President, aided by (at present) three ministers. The presidential period is four years, and no person can be re-elected to that office. The judicial power is divided into two sections, one of which resides in Leon and the other in Granada. They are composed of four magistrates each, and appeals may be made from either section to the other. The magistrates are elected by Congress for four years each; and one half of the members of each section are changed during each legislative period.

The present President of the Republic is Señor Don Joaquin Zavala, inaugurated on March 1, 1879; and the Cabinet of 1880 was composed of the following ministers: Foreign Affairs and Public Instruction, Dr. A. Cárdenas; Interior, Justice, and Public Worship, Licentiate V. Navas; and Finance, War, and Marine, Colonel J. Elizondo.

The President of the Senate is Señor Don A. H. Rivas; and the President of the Chamber of Deputies, Señor Don A. Zavala.

The Consul-General of Nicaragua in New York is Mr. Alexander J. Cothel, and the Consul is Mr. C. R. Flint.

The United States Minister, accredited to

the five Central American republics and resident at Guatemala, is Dr. Cornelius A. Logan.

According to the new military code, all Nicaraguans between the ages of eighteen and fifty-five years are compelled to serve in the army. The conscription list comprised, in 1878, a total of 44,788 men, as follows: First category, 30,264; second category, 10,297; third category, 4,227; conscripts from the first category, 24,686; contingent assigned to the departments, 646.

In Nicaragua, as in the other Spanish-American states, much zeal and energy are displayed by the Government in promoting the cause of public instruction. The number of primary schools in the republic in 1879 was 135 (of which 107 were for males), with 137 teachers, and an aggregate attendance of 8,596. There were, also, numerous private schools. The annual expenditure for primary education is reported at \$50,000. The intermediate and higher branches of learning are taught in seven colleges and five schools distributed throughout the country, with fifty teachers and 612 scholars. Normal instruction is given in the College of Granada and in that of El Espíritu Santo, at Leon, pursuant to special contracts with the Government. Efforts were being made for the re-establishment of the old university.

The national revenue for the fiscal year 1879-'80 amounted to \$2,436,093, of which \$906,347 were derived from the customs department; and the expenditure to \$2,570,137; thus constituting a deficit of \$134,044.

The national debt is set down by foreign economists at \$1,159,571 in consolidated bonds, and \$18,703 in bullion; but national economists have of late taken pains to proclaim and, if possible, to prove that "the republic has no foreign debt, since the only one by which it was encumbered—the so-called 'Barclay debt'—dating from the time of the Federation, has been canceled long ago." Whether in the form, however, of original obligations or government bonds, the indebtedness still exists: consolidation may precede, but it does not involve, extinction.

The subjoined tables exhibit the values of the foreign trade of Nicaragua for the years 1877-'80:

IMPORTS.

YEARS.	Values.	YEARS.	Values.
1877.....	\$1,217,716	1879.....	\$1,466,369
1878.....	913,461	1880.....	1,470,114

EXPORTS.

YEARS.	Values.	YEARS.	Values.
1877.....	\$1,276,069	1879.....	\$1,650,709
1878.....	1,319,153	1880.....	2,037,622

The chief staples of export are India-rubber, coffee, gold and silver, dye-stuffs (principally indigo), deer-skins, cedar-wood, etc.

The present era of peace affords the Government an opportunity, which it has embraced, of increasing the means of communication, and particularly those facilitating the transport of products from the interior to the coast. At

the present time there is in course of construction a line of railway from the Pacific sea-board to the great lake of Managua, *via* Corinto, Chinandega, and Leon, the lake terminus being at Moábita. The remainder of the route to the Atlantic will be performed by means of steamers of five feet draught. The work of canalizing the river San Juan for that purpose had already been commenced. On the completion of the bridge across the Paso de Caballos (a narrow arm of the sea separating from the mainland the island on which the port of Corinto stands), through trains will begin to run between Corinto and Chinandega. The branch from the latter point to Leon was being rapidly pushed forward toward completion.

That the project of opening an interoceanic canal through Nicaraguan territory, far from having been relinquished, is likely soon to become an accomplished fact, is apparent from the following report:

WASHINGTON, December 15, 1881.

The bill introduced to-day by Senator Miller, of California, "to incorporate the Marine Canal Company of Nicaragua," names as persons to be so incorporated, U. S. Grant, E. D. Morgan, H. J. Jewett, Howard Potter, William R. Garrison, Frederick Billings, George B. Loring, William L. Merry, William B. Franklin, Solon Humphreys, Frederick Butterfield, E. F. Beale, William H. Barnum, George F. Baker, Daniel Ammen, Edward C. Anderson, Alexander Taylor, U. S. Grant, Jr., Edward M. Clymer, S. L. Phelps, Charles Dana, Robert Harris, Edward F. Smith, Robert Ten Broeck, William Dennison, Manuel Cuadra, Thomas De Franco, and A. G. Menocal. The bill proposes to authorize this company "to do all lawful things to secure the full enjoyment of the powers, privileges, rights, benefits, and grants, contained in a canal concession made by the Republic of Nicaragua to the Provisional Interoceanic Canal Society, and confirmed May 22, 1880." The principal office of the company is to be in New York city. Its capital stock is to consist of not less than 500,000 nor more than 1,000,000 shares of \$100 each, which shall, in all respects, be deemed personal property, and its affairs are to be managed by a board of eleven directors, one of whom shall be appointed by the President of the United States, and one by the Government of Nicaragua. The bill further provides, that the United States shall guarantee to the said company, for the period of twenty years from and after the completion of its canal and the commencement of the passage of vessels through it from ocean to ocean, that its net receipts shall not be less than three per cent upon its capital stock; but this agreement is accompanied with stipulations that not more than \$1,000,000 shall be deducted from the gross receipts in any one year for operating expenses, and that no interest upon any indebtedness of the company shall be paid out of its canal receipts until three per cent upon its total capital stock shall have been earned, and the United States thereby released from liability. The ninth section provides that the aggregate tolls and charges for the transit of any vessel through the canal shall not exceed \$2.50 per ton of weight, or of forty cubic feet measurement (according to the usage observed by the Pacific steamship companies), of all cargo, fuel, and supplies on board any vessel in transit; but the company may, at its option, charge in lieu thereof not exceeding \$1.25 per ton, actual displacement of any vessel, when in the canal. Section 10 requires the company to transmit, yearly, to the Secretary of the Treasury a statement of the total canal receipts and expenditures, and provides that, whenever it shall be found that the net receipts

therefrom exceed ten per cent per annum upon the capital stock, the rate of charges shall be reduced so as to yield not more than ten per cent. The eleventh section of the bill is as follows: "The United States shall exercise such control over the canal as it, now or may at any time be prescribed by treaty with Nicaragua, and shall enjoy its free use for the transportation of troops, munitions of war, and mails, and otherwise in accordance with stipulations of existing treaties. And should the United States see fit, for national reasons, to temporarily occupy and manage said canal, the right to do so is hereby reserved and secured to the Government, upon payment to the stockholders of said canal, at the rate of five per cent per annum annually, upon the capital invested, together with the necessary expenses for the maintenance of the work."

In conclusion, the bill provides that any refusal on the part of the company or of its board of directors to comply with the provisions of this act, shall render the company liable to forfeit all rights derived therefrom, and that "Congress may, at any time, having due regard to the rights of said company, alter or amend this act."

In answer to the question, "What are the advantages of the Nicaragua route?" General Grant is stated to have replied as follows, about December, 1880: "The Nicaraguan route has the advantage of being farther north, a less distance from the tropics for vessels to sail or steam going from the Atlantic or Pacific ports or from Europe, or to the East, with the exception of Australia, where they have to go through the tropics anyhow; and the same is the case with New Zealand. A line of lower levels is found by the Nicaraguan route than any other, and then at the summit is a very large and extensive plain, and the water-shed of that region is to the lake, instead of to the stream which empties into it, so that it receives the water-fall of the heavy tropical rains, and, being of so large an extent, it has but a few feet rise or fall. Its banks reach within twelve miles of the Pacific Ocean, so that a canal could be built from the lake to the Pacific without any water-course running into the canal, or without any water-shed to throw its water into the canal. The outlet of this lake is to the Atlantic side by a large, navigable river. It has no tributaries coming into it until you get well down toward the mouth. Consequently it is not subject to rise or fall, or to overflows, being only, as I remember, about four inches between the highest water in the rainy and the lowest water in the dry season. This river is already navigable for large steamers. There are three rapids to go over. By a system of dams, starting the first dam just above where the tributary comes into the river, the San Juan, slack-water navigation could be made for the largest vessels up to the first of the rapids; then by systems of dams and locks there could be slack-water navigation all the way, locking the rapids to the ends of the dams wherever they occur. Then the canal would leave the river from the lower dam and run out to the Atlantic side over ground where it would have no stream running into it and no water-shed to pour its waters into the canal."

General Grant's opinion in regard to the

Panama Canal appears to be that the prejudice therefrom to the Nicaragua Company would be but temporary.

One or two uprisings of a revolutionary character took place during the year 1881; but the Government made use of prompt and decisive measures to repress disturbances, one being the expulsion of the Jesuits from the republic, members of that society being deemed guilty of demonstrations subversive of public order in Leon, and the immediate cause of the riots.

NORTH CAROLINA. The Legislature of this State, consisting of 83 Democrats and 12 Republicans in the Senate and 83 Democrats and 37 Republicans in the House, assembled on the 5th of January, 1881, and remained in session until the 14th of March. On the 18th of January Governor Jarvis was inaugurated. In his address he enlarges upon the need of immigration and the importance of making the resources and advantages of the State more fully and generally known. On the subject of the regulation of railroads, he says:

But while it is imperative to encourage every known method for the development of the resources of the State, it is just as important to guard against anything calculated to retard it. If this be so, then it becomes the duty of the law-making power of the State to see to it that the lines of transportation operating in the State do not, by their discriminating charges, transfer to other States the industries that properly belong to ours. I do not join in the wholesale abuse of the railroads that some heap upon them, but I do believe they ought to be required to do exact and equal justice to all sections. This I think to be their interest as well as their duty, and, if they refuse, I have no doubt about the power of the State to compel it. But these lines of railway have been the great agency in the development of the State, and we ought to be just as careful to see that we do not treat them unjustly as we are to see that they treat us fairly. The most amicable as well as the most effective tribunal to adjust these matters, which has thus far been tried, is a first-class railroad commission. Such a commission, elected by the General Assembly every two years, with proper powers, would, in my opinion, be of great service to the people.

He directs attention especially to the necessity of improving the educational system of the State, and says:

The time for a bold onward movement in the great cause of education is propitious and the surroundings favorable. It is the beginning of an administration with no embarrassments. There are no works of internal improvement to be provided for. Our public debt, by its adjustment, is small and can no longer frighten us. Less than \$150,000 will pay its annual interest. Our rate of taxation is exceedingly low as compared with other States. I have obtained officially the rate in twenty-seven States, and in them all it is higher than in ours, and in most of them greatly so. I do not know the rate in the others. Our assessment of property for the purposes of taxation, as everybody knows, is exceedingly low. If all the property was honestly listed and fairly valued at its cash value, the property of the State would be at least \$300,000,000, instead of the \$156,263,241, as now returned. Public sentiment has prepared for a large increase of taxation for schools, and will sustain it.

There were passed at this session of the Legislature 384 bills. The two most important

acts are those relating to public schools and prohibition. The chief provisions of the school act are as follows:

1. The act provides that the State Board of Education shall recommend a series of textbooks, which shall be used in all the public schools of the State for a period of three years, and until otherwise ordered, the State Board to regulate the prices.

2. It provides for traveling expenses of the State Superintendent, not to exceed \$500, and for a clerkship to his office at \$600.

3. It abolishes the office of county examiner, to take effect from and after the first Monday in June, 1881, and substitutes therefor the office of county superintendent of public instruction, who is to be elected on the said first Monday in June by the county board of education and the board of county justices jointly. The county superintendent is required to examine candidates who desire to teach, and pass upon their qualifications; to visit and inspect the public schools in the county; to advise with teachers as to the best methods of instruction; to suspend teachers for want of qualification, neglect of duty, or improper conduct, and notify the school committee of such suspension, stating the cause; to distribute blanks to school committeemen and teachers; collect school statistics, and receive reports from teachers heretofore made to county treasurer; to countersign all orders on county treasurer for school moneys in payment of teachers' salaries; to hold and conduct teachers' institutes, and to exercise general supervision over the public schools of his county, and to report the school statistics of his county annually on the first Monday of December to the State Superintendent of Public Instruction. For these duties he is to receive a compensation of three dollars per day for each day engaged, to be paid out of the unapportioned school fund of the county. Provided, that he shall not receive in any one year more than five per centum of the entire amount of the school fund of the county.

4. It requires that the school funds of the county shall be apportioned on the first Monday in January in each year, and shall be based on the actual amount of money in the hands of the county treasurer, and not on the amount levied on the tax-list as under the old law.

5. The county board of education may annually apportion \$100 out of the public-school moneys to defray the expenses of teachers' institutes, and, where it is deemed practicable or advisable, a number of counties may unite in one institute.

6. The school year is changed so as to correspond with the county fiscal year, and will therefore end November 30th in each year.

7. Twelve and a half cents is levied on each \$100 valuation of property for school purposes, and if this, with the capitation-tax, fines, etc., shall be insufficient to maintain one or more schools in each district of the county for four months in the year, then the county board of

education is required to levy a special tax to meet the deficiency. Said special tax is to be distributed by the county board under such rules as in the judgment of said board will secure a four-months school in each district, as required by Article IX, section 3, of the Constitution.

8. Additional safeguards are thrown around the collection, handling, and disbursement of school moneys, and school committeemen are required to take deeds for all school-house sites acquired by them, which must be regularly probated, recorded, and deposited with the county treasurer for safe-keeping. Blanks for said deeds are to be furnished to the said committeemen by the county school authorities.

9. School committeemen are authorized to pay full cost of building, repairing, and furnishing school-houses, instead of half the cost, as provided in the old law, this cost to be paid out of the school fund of the district for which the house is built.

10. Certificates from county superintendents will be valid in the county where issued, for one year from date, and no teacher can be employed who does not produce a certificate, of proper date, from the county superintendent.

11. First-grade teachers may receive three dollars per day, second-grade two dollars per day, and third-grade fifteen dollars per month for services. No teacher can be paid for a less school term than one month.

12. The State Board of Education is required to apportion, on the first Monday in August, all the school moneys in the State Treasury.

There was also a special act passed by the General Assembly requiring the State Board of Education to sell during this year the United States bonds belonging to the school fund, and to distribute the proceeds, together with the distribution school fund in the hands of the State Treasurer, to the several counties of the State, on the basis of school population. This fund was expected to amount to about \$130,000. The entire school fund for the year was estimated at \$500,000.

In addition to the appropriations made in 1877 for normal schools at Chapel Hill and Fayetteville, section 5 of the act passed at this session of the General Assembly making an appropriation to the university appropriates \$4,000 for other normal schools, \$2,000 for white teachers, and \$2,000 for colored teachers, providing that not less than four schools for each color shall be established. The location, organization, and management of these schools are under the supervision and control of the State Board of Education.

Acts were also passed creating two new counties (Durham and Vance), punishing cruelty to animals, allowing defendants and their wives to testify in criminal actions, providing for a codification of the laws, and levying a tax to pay the interest on the public debt. Legislation respecting prohibition was demand-

ed by various religious and other bodies and by a State Prohibition Convention, consisting of 200 delegates from all parts of the State, which met in Raleigh in January. The act which was passed is as follows:

SECTION 1. That any person who shall manufacture, buy, or sell, either directly or indirectly, any spirituous or malt liquors, except wines and cider, or by any shift, subterfuge, or device, spirituous liquors, or any liquor of which spirituous liquor is a material or constituent part, in any quantity, in this State, otherwise than by this act provided, shall be guilty of a misdemeanor, and upon conviction thereof in any court of record, having jurisdiction of the same, shall be fined not less than one hundred nor more than one thousand dollars, and be imprisoned in the discretion of the court.

SEC. 2. That spirituous liquors, or liquids of which spirituous liquors are a material and constituent part, may be kept and sold as by this act provided, and in no other way or manner, only for medical, chemical, and mechanical purposes, and for these purposes only by a druggist, apothecary, or physician, who shall have obtained a license in pursuance of the provisions of this act, allowing him to sell the same for such purposes; apothecaries or physicians in each county shall have such license; and any druggist, apothecary, or physician who shall have obtained such license shall not keep at any time a greater quantity of such spirits on hand than thirty gallons; and shall not sell to any person a greater quantity, at one time, than one gallon.

SEC. 3. The county commissioners of the several counties in the State may, upon application made to them, only in the way in this section provided, by a druggist, apothecary, or physician, grant a license to last for one year and no longer, to sell such spirituous liquors as are mentioned in this act only for medicinal, chemical, and mechanical purposes, and in the way and manner in this act directed, and no other; but before granting any such license they shall ascertain and find by the oath and examination of two or more sober and respectable citizens of their county that such applicant is a sober, reliable, and trustworthy person; and they shall record the names of the citizens so by them examined and the facts so found by them upon the minutes of their proceedings in connection with the orders and proceedings granting such license; and any druggist, apothecary, or physician desiring to obtain such license shall apply for the same by petition setting forth that he is a druggist, apothecary, or physician in the county where such application is made—the place where he sells drugs and medicines or regularly practices medicine—that he desires to keep and sell such spirituous liquors only for medicinal, chemical, and mechanical purposes; that he will not knowingly keep or sell such liquors otherwise, nor in greater quantities than as by this act allowed, and that he will well, truly, and faithfully keep and observe the provisions of this act so far as the same are applicable to him; such petitioner shall subscribe and swear to this petition, and the same shall be filed and preserved among the papers and records of the county commissioners before it shall be presented. But no druggist, apothecary, or physician shall be licensed to sell any of the spirituous or malt liquors herein mentioned until he has executed and given to the board of commissioners of the county wherein the liquors are proposed to be sold, a bond with good and sufficient security, to be duly justified in a sum of not less than five hundred and not more than five thousand dollars, conditioned that he will faithfully comply with and perform all the requirements and conditions of this act. The said bond shall be recorded and filed as in cases of official bonds, and whenever the said commissioners shall have reason to believe that the party so licensed has violated any of said conditions or provisions, they may put the same in suit and prosecute to judgment,

and in addition thereto they may for good cause revoke said license, first giving to the holder thereof at least two days' notice of the time when a notice to revoke will be made.

SEC. 4. A druggist, apothecary, or physician having a license to keep and sell such spirituous liquors as by this act provided, shall not sell the same to any one person at one time, in a greater quantity than one gallon, nor in any quantity, unless the person applying to purchase the same shall present and deliver the certificate of a sober and respectable practicing physician, not a licensed dealer under this act, given upon his honor, to the effect that such spirituous liquors so required are in fact required for medicinal purposes; or a like certificate of a sober, respectable chemist or artist, that such spirituous liquors are required in fact for chemical purposes; or a like certificate of a sober, respectable mechanic that such spirituous liquors so required are in fact required for mechanical purposes; and if any physician, chemist, artist, or mechanic shall make any such certificate falsely stating or suggesting the purpose for which such spirituous liquors specified by him are required, every such physician, chemist, artist, or mechanic making such false certificate shall be deemed guilty of a misdemeanor, and upon conviction in any court of record having jurisdiction thereof shall be fined not less than one hundred nor more than five hundred dollars, and may, in the discretion of the court, be imprisoned.

SEC. 5. Every druggist, apothecary, or physician who shall have a license to sell such spirituous liquors as provided for in this act, and shall violate the provisions of the same in any respect, directly or indirectly, or by any shift or subterfuge, shall, for every such violation thereof, be deemed guilty of a misdemeanor, and, upon conviction in any court of record having jurisdiction, shall be fined not less than one hundred dollars, nor more than five hundred dollars, and be imprisoned in the discretion of the court; and, moreover, shall forfeit his said license, to be canceled by the court; and if any clerk or employé of such druggist, apothecary, or physician shall in any way violate the provisions of this act, under pretense of selling such spirituous liquors for his employer, or otherwise, he shall, for every such offense, be deemed guilty of a misdemeanor, and upon conviction in any court of record having jurisdiction shall be fined not less than fifty dollars nor more than one hundred dollars, and be imprisoned at the discretion of the court.

The act was to take effect on October 1, 1881, but on August 1, 1881, an election was required to be held, for or against prohibition. If the majority voted against prohibition, the prosecutions authorized by the act were not to be made.

The Anti-Prohibitionists met in convention at Raleigh on the 1st of June. Nearly every section of the State was represented, but the greater number of the delegates were from west of Raleigh. About a quarter of the number were colored. The following resolutions were adopted:

Whereas, A bill to prohibit the manufacture and sale of spirituous and fermented liquors, for the purposes of beverage, within the borders of North Carolina, was passed by the last Legislature, to be submitted to the people, for ratification or rejection, at an election to be held on the first Thursday in August next; and

Whereas, The said act is obstructive to the moral, social, political, and material progress of our people: Because it proposes to deprive them of reasonable and proper liberties they have always enjoyed, is sumptuary in its character and opens the door to further encroachments upon those liberties. Because it is violative of our State Constitution in letter and spirit. Because it is incapable of enforcement, and, as worse

than a dead letter on our statute-books, will beget disrespect for other and better laws, and looseness in their administration. Because it proposes a monopoly hateful to the instincts of a free people, and seeks to establish that monopoly in the hands of a class who have neither sought nor desired it, and whose best interests would be subverted in its success. Because, in the light of its working in other communities, we see that it opens the door to more sin, misery, and wrong than it prevents, and prepares the ground for a new crop of crimes and abuses. Because it proposes to impose upon the monopolists it creates, the druggists and physicians licensed under its degrading conditions, and offers a premium for the debauching of two noble professions. Because it discriminates against our own people in favor of others, by prohibiting the manufacture of liquors that the act itself declares are necessary to the medical, mechanical, and scientific uses of our people. Because it discriminates between classes among our own people, and offers privileges to one it denies to another. Because, under it, the giving away of liquor not being prevented, will spring up a custom among merchants of treating their customers, susceptible of great abuse. Because it decreases the sources of State, county, and municipal revenues, makes new taxes necessary, and prepares a new and onerous burden for tax-payers little able to bear it. Because it will rob the public sources of moneys necessary to their support, and makes no provision for the gap in their revenues. Because under it no form of inebriety can be restrained, and, where open drinking is suppressed, secret drinking will ensue. Because the best and most perfect forms of such legislation are inadequate to the suppression of a temptation common to all mankind, and ordained, in fact, by the Creator of the universe. Because two thirds of the entire spirituous product of the country being used for scientific, mechanical, and medical purposes, it is impracticable to stop its manufacture, unless every industry connected with it is first killed outright, and our people are brought back to the ways and methods of barbarous days. Because, not only powerless to cure the ills it treats, and sure to engender and foster new and greater evils, it is, for the reasons recited, and many others, obnoxious to the cause of virtue, morality, peace, prosperity, and happiness among our people: therefore, be it

Resolved, That we, the real representatives of the cause of temperance in North Carolina, the anti-prohibitionists, here in convention assembled, find the said bill unworthy the support of enlightened freemen and good citizens:

And, be it resolved further, That we pledge ourselves to resist its adoption by every worthy means at our command, and call upon our fellow-citizens of every creed and race, of every shade of religious and political opinion, to join with us in condemning at the ballot-box this most unjust, unworthy, and improper law.

Subsequently the following address was issued by the Executive Committee:

It often happens, in the march of progress, among enlightened nations, that the attention of a community is aroused to the existence of some great evil in its midst. A recognition of the evil begets desire for its remedy. Agitation ensues, measures of reform are hastily projected, and experiments in legislation are proposed for the suppression or limitation of the evil.

Of all the problems that thus seize upon the public mind periodically and thrust their claims for solution upon civilization and the spirit of progress, none is of greater importance, perhaps, than that which is involved in what is commonly known as the "temperance question."

The people of the State of North Carolina have been suddenly and rudely plunged into consideration of this perplexing problem, while a specious, ready-made,

legal solution is held out for their adoption, the promoters of which give currency to such promises of happy results, such prophecies of good obtainable, as most readily appeal to those emotions of generosity, charity, and morality characteristic of high civilization. A new alliance between Church and State is proposed, and Christian organizations, grown numerous and powerful in a civilized land, are demanding legislative control of the public conscience.

The gravity of the subject requires that it should not be handled lightly, but considered with a calm and even mind, and every step of attempted reform be based on truth and right reason. Great dangers must be met by great prudence—not by headlong impulse—for errors that enhance the ills we seek to cure grow from blunders into crimes.

History shows on every page of its record that with growth of power the Church comes often to demand State assistance to enforce its teachings—pleading always a good to be gained, a truth to be sustained by civil enactment. And just as often, too, it shows that such alliances are fruitful only in evil to the Church, to religious sentiment, and the cause of morality, while through them weakness and demoralization creep upon the State to canker the very heart of government and sow beneath its foundations the seeds of corruption and decay.

Legislative edicts free from the entanglements of false alliances, free from taint of prejudice or suspicion of jobbery, instinct with the wisdom of true state-craft and responsive to the practical demands of society alone, should have the support of the judicious, acting in such a cause. They must not rest in the emotions and prejudices of good though unthoughtful people, but appeal to the common sense of thinking and reasonable men; they must not deal falsely with Scripture; they must not defy the mandates of science; they must not ignore the lessons of history. Obnoxious to these plain first principles of a wise public policy, they are worse than useless, and their enactment a return to false systems that shackle us in slavery to new abuses without enfranchising us from the dominion of the old.

We hold the interests of truth, morality, religion, and a high standard of public policy to be opposed to the usual forms of prohibitory legislation. We hold that the errors, inaccuracies, inefficiencies, and reacting evils common to this form of legislation are glaringly exemplified in that special enactment known as the Prohibition Act, now under consideration by our people. The certainty of aggravating evils sought to be cured, while engendering, multiplying, and fostering new and greater wrongs, is found in its false theories and pernicious methods.

A just and fair treatment of the question is safest at first because it must come at last. Those who would obstruct this treatment by a blind and tenacious adherence to so-called systems of reform, false in theory, fanatical in methods, incapable of beneficial results, and fruitful in reactive evils, are, before God and man, chargeable with the grave responsibility of seeking extension of the ills they deplore and assisting to spread a curse they themselves declare threatens to sap the foundations of morality and decency, and, if not checked, to overthrow the social fabric of civilization itself.

And, therefore, we hold that the rejection of the act by the electors at the polls is the first great step in the cause of temperance reform possible to the people of North Carolina.

The result of the vote was as follows: for prohibition, 48,370; against prohibition, 166,325; total vote, 214,695; majority against prohibition, 118,955. Only four of the ninety-six counties gave majorities for prohibition, viz., Cherokee, Clay, Transylvania, and Yancey. With respect to the composition of the vote the Raleigh "News and Observer" says:

We suppose that 8,000 Republicans may have voted for prohibition, leaving, perhaps, 40,000 Democratic supporters of that side. Of the 166,325 who voted against the measure, perhaps 75,000 were Democrats and 91,000 Republicans. To be sure, these are only surmises, founded on the normal strength of the parties, and taking it for granted that the 30,000 voters who did not vote were about equally divided between the parties. We assume that the 214,000 votes cast represent 114,000 Democrats and 100,000 Republicans. And so it appears that nearly twice as many Democrats voted against the bill as for it, and more than eleven Republicans voted against it where one voted for it. These calculations are, however, more curious than profitable, for the whole matter is mere speculation. All that we know is that the majority approximates 120,000.

In May a convention of colored Republicans was held in Raleigh, which demanded greater recognition of their race by the party in the State in appointments and elections to office. In September a meeting of county superintendents of public instruction was held in Raleigh, and a State association was formed. There are in the State sixty-six educational institutions, such as university, colleges, high-schools, military academies, etc. There are in addition graded schools at Raleigh, Wilmington, Bakersville, Goldsboro, Fayetteville, Salisbury, Charlotte, and Greensboro. There are twenty-one agricultural societies and clubs of note. There are four paper-mills, all water-power, with a daily capacity of eight tons of paper. There are fifty-nine cotton and woolen factories, besides factories for the manufacture of tobacco, agricultural implements, furniture and wood-work, sewing-machines, etc. There are no less than twenty-two railways, whose lines are wholly or in part in the State. The extreme length of the State, east to west, from Dare to Polk Counties, is 485 miles, and the extreme breadth, from Brunswick to Granville, north and south, is 188 miles. There are ten sounds, and the area of the sounds and bays is 3,300 square miles. There are fifteen lakes, covering an area of 200 square miles. There are three Insane Asylums and two Institutions for the Deaf and Dumb and the Blind. The different sections of the State were settled as follows: By English Quakers and Baptists in the northeast; by Swiss and French in the east; by Scotch in the southern tier of counties; by Scotch-Irish a little farther west; by Moravians in the northwest, and by Dutch in the west center. The various crops are chiefly raised as follows: Rice and corn in the east; cotton a little nearer the center; then corn and cotton; next tobacco; yet a little farther west the small grains; then the great fruit country; and on the extreme western border the region where buckwheat, wheat, barley, etc., flourish.

The acreage of tobacco was 57,208, and the yield 26,986,213 pounds. North Carolina stands fifteenth among the States in production of corn, and the increase is 50 per cent over 1870. In the cereals the State is reported as follows: corn, 27,959,894 bushels; wheat, 3,385,670; oats, 3,830,622; barley, 4,799; rye, 284,993;

buckwheat, 45,209. In oats and rye it is nineteenth in order of production, barley thirty-eighth, rye seventeenth, and buckwheat eighteenth.

Below is given the cotton yield of the State according to the United States census of 1880. The counties have been arranged in three groups, the first embracing the nineteen sea-coast counties, which produced only 33,613 bales of cotton. The next group comprises the old *ante-bellum* cotton counties as far as practicable; these produced 226,505 bales. The other group, as far as may be, gives an idea of the new cotton territory, brought under culture since the war; the number of bales produced in it runs up to nearly 130,000. It includes Wake, now the largest cotton county in the State, where but little if any was grown before the war. The entire number of acres devoted to the staple in 1879 was 892,982, and the number of bales grown was 389,576. These figures were increased ten per cent in 1880, and increased again in 1881. Most of this increase is in the new cotton territory, so that year by year the culture of the staple is extending in the State:

Wake County produced the most corn, 608,-592 bushels. Rowan comes next, producing 592,639 bushels, and is first in the yield of oats, 140,446 bushels. Davidson produced the most wheat, 174,271 bushels, and Ashe the most rye, 33,809. Greenville is the first in the production of tobacco, 4,606,358 pounds. Greenville, Person, Caswell, and Rockingham produced over a third of the entire tobacco-crop of the State.

A striking feature in the agriculture of the State is the great change that has been made in the cultivation of tobacco, both in the character of the plant grown and in the greatly extended area of culture. Prior to the war, tobacco was grown in only six or seven counties bordering on Virginia, and the variety then cultivated was known as "shipping tobacco," a black variety, which was grown exclusively on heavy soils of rich alluvial composition. Since the war, from the superior value of the product, the attention of growers has been turned exclusively to "yellow tobacco"—the world, in fact, deriving its largest supply of this variety from North Carolina. The culture of the plant has been extended from the border counties into the central part of the State, along the Piedmont belt to the western limits of the State—not uniformly, but in certain localities.

Of late years the cultivation of upland rice has grown into a great industry, and this crop now forms one of the staple productions of the State. Anterior to the war, rice-culture was confined to the lower valley of the Cape Fear and to the water-grown variety, but the cultivation of the upland crop is now prosecuted with the most encouraging results. The culture of the vine is now an established industry, and is being prosecuted with excellent results. The principal vineyards are situated at Fayetteville, Enfield, Kittrell, and near Salem, nearly in the central part of the State. The production of silk is also carried on in several of the central counties. In the fruit district much attention is given to the preparation of dried fruit. The State stands second in the manufacture of smoking-tobacco and fourth in manufacture of plug-tobacco. In 1880-'81 it manufactured 4,379,565 pounds of the former and 6,405,585 of the latter.

The receipts into the State Treasury during the year ending September 30, 1881, were \$645,-743.05. The expenditures for all purposes aggregated \$625,416.59. Of the disbursements, \$41,952 were on account of the Agricultural Department, being taxes on fertilizers, which are required by law to be paid into the State Treasury for the benefit of that department, but are no part of the general fund.

Of the \$71,179.55 paid on account of the Insane Asylum at Raleigh, \$21,179.55 was for the year 1880, which was not drawn till the close of that fiscal year (September 30, 1880). Of the expenses of the Institution for the Deaf, Dumb, and the Blind, \$32,500 was for the year 1880. These amounts aggregate \$95,632.29, which, being deducted from the total disbursements, leaves the expenses legitimately chargeable to this fiscal year \$529,-784.30.

The following is a summary of business of the port of Wilmington, for the calendar year 1881: The receipts of cotton foot up 128,096 bales, as against 106,156 bales for last year; spirits turpentine, 84,873 casks, as against 89,-954 casks for last year; rosin, 431,121 barrels, as against 480,984 barrels for last year; tar, 60,540 barrels, as against 54,186 for last year; crude turpentine, 91,444 barrels, as against 108,281 barrels for last year. The exports foot up as follows: To domestic ports—63,341 bales of cotton, as against 40,348 bales for last year; 29,067 casks spirits of turpentine, as against 33,272 casks for last year; 40,160 barrels rosin, as against 48,361 barrels for last year; 44,479 barrels tar, as against 39,409 barrels for last year; 2,335 barrels crude turpentine, as against 3,356 barrels for last year. To foreign ports—57,664 bales of cotton, as against 65,718 bales for last year; 58,477 casks of spirits turpentine, as against 69,453 casks for last year; 445,659 barrels of rosin, as against 399,349 barrels for last year; 14,909 barrels of tar, as against 14,032 barrels for last year; 102 barrels crude turpentine, as against none for last year.

Total exports for 1881:

Cotton, bales.....	121,005
Spirits turpentine, casks.....	87,544
Rosin, barrels.....	485,819
Tar, barrels.....	59,893
Crude turpentine, barrels.....	2,487

As compared with total exports for 1880:

Cotton, bales.....	106,166
Spirits turpentine, casks.....	102,725
Rosin, barrels.....	447,710
Tar, barrels.....	53,441
Crude turpentine, barrels.....	8,356

Total number of vessels arrived during the year, 306 American, registering 119,414 tons; and 244 foreign, registering 88,292 tons. Grand totals: 604 vessels, registering 207,706 tons.

In the extreme western part of the State, in Cherokee, Graham, Jackson, and Swain Counties, are about 1,100 Cherokee Indians, including a few Catawbas, who avoided transportation to the Indian Territory when the other Cherokees were removed. They have lands and a tribal government of their own, are farmers, and many of them members of the Baptist Church. They intermarry considerably with the whites, and do not increase in numbers.

The population of North Carolina by counties, as finally returned by the census of 1880, and as compared with the corresponding figures for 1870, is as follows:

NOXIOUS INSECTS AND PLANT PARASITES. Recent observers have detected bacterial life in common fruit-tree diseases, and have found experimental evidence connecting the disease with the microphytic germs. Professor T. J. Burril detected moving microscopic objects in the juices of blighted pear-trees in 1877, which he afterward discovered to be bacteria. In 1880 he found similar organisms associated with the disease of apple-trees called twig-blight. Drops of a whitish, viscid substance, which after a while became brown, oozing from diseased parts, were found to be largely composed of the microphytes, which were double or single ovoid bacteria, each about .001 millimetre thick, and .0015 millimetre long. The starch-granules, which are abundant in healthy cells, were absent in the infected tis-

suess, and the products of their fermentation were revealed by tests. The manner in which the bacteria penetrate the cell-walls is problematical. It must be in the germ form that they pass from one cell to another. The germs are not carried by the circulating sap, or water, because the disease spreads evenly in all directions from its starting-point.

Inoculation of healthy trees by puncturing with a needle or knife-point dipped in the viscid exudation led to the development of the disease, in about half the cases, after ten or twelve days, or longer. External applications of the virus to the bark or leaves produced no effects. The virus from the apple-blight produced the fire-blight in pear-trees, and was more fatal in its action than that from the pear-blight itself.

By similar evidence the yellows in peach-trees has been traced to micro-organisms. In the cells of the infected shoots few starch-cells, but a multitude of bacteria, are present. They are of oval form, not much longer than wide, and joined into straight rods. The Lombardy

poplar and the aspen are subject to similar diseases, which are found to be accompanied by the multiplication of bacteria.

The cause of the mysterious failure of sugar-beets, on land on which this crop has been raised for many years in succession, has been found to be a minute parasite, which is nourished by the decaying roots. The experiments of Kühn and others, which led to the discovery of the parasite, show that the soil first becomes infertile in patches, where the plants begin to die, from which centers the beet-sickness, as the phenomenon is called, extends over the entire field, and is capable of spreading through whole districts. It was supposed until the recent discovery, as it is in the cases of other crops which languish or fail after repeated plantings on the same soil, that it was due to the exhaustion of certain soluble materials in the soil which are specially required for the particular plant. Analyses of soils showed no deficiency of nutrient elements in the case of the beet-sickness. Chicory, which requires the same kind of soil as the beet, flourished in the sickened soil. Other vegetables of many kinds planted in an infected field were attacked. The roots of the young beets, it was found, were attacked by the parasites, and their larvæ lodge in them. Of different remedies tried, the most practicable is to sow the field thickly with beets, and then pull up the entire young crop, and, by burning it, destroy the insects after they have pierced the roots.

Experiments with prussic or hydrocyanic acid, conducted by Dr. Franz König, prove that it is the best disinfectant for plants infested with animal parasites. An atmosphere in which only one third gramme of the acid is diffused in every cubic metre of the air, a quantity which is not fatal to the tenderest parts of plants, will destroy the phylloxera and its eggs in half an hour's exposure. Prussic acid is less injurious to some plants than to others, but its action on animals is much more violent than on any plants. Large winged insects die in an atmosphere containing only one tenth gramme to the cubic metre. Robust, woody plants, with their leaves and flowers, can stand a gramme of the acid to the cubic metre of air.

The remedies for phylloxera, brought forward at a congress called at Bordeaux for the discussion of the subject, were submersion of the vineyards, and the application of bisulphide of carbon and sulpho-carbonates. The plans of grafting French varieties of grape upon American stems, or American vines on French stems, are found to produce plants which are usually proof against the insect-pest.

Two kinds of insecticides are known which are completely effective, and at the same time harmless to vegetation. These are fatty substances, and a certain group of composite flowers. An oily substance, when it can be applied so as to cover the surface of the insect's body in a film, causes instantaneous death by suffocation. It closes the spiracles, and excludes the

air from the tracheal tubes. There are, however, but few cases in which this insecticide can be administered. The other remedy against destructive insects finds a very extensive application in the form of a powder called commonly "Persian insect-powder." It is made from flowers of the *Anthemis* group. It destroys insects by paralyzing their nervous system. The mode of its action is not understood. To all other life it seems to be almost innocuous. The most efficacious of these flowers are species of the genus *Pyrethrum*. The common *Artemisia filifolia* is sufficiently powerful to destroy delicate insect forms. Instances have occurred recently in which the Persian powder has acted injuriously on vertebrate animals.

NUTRITIVE INGREDIENTS AND VALUES OF THE FOOD WE EAT. Among the numerous branches of biological research, one, and by no means the least interesting and important, is the study of foods and nutrition. Within the past fifteen years especially, a very large amount of scientific labor has been devoted to the investigation of the composition of foods and the function of their ingredients in the animal economy. Indeed, very few persons this side of the Atlantic have any just conception of the magnitude of this work and its results. And, though many of the most important problems are still unsolved and must, because of their complexity, long remain so, yet enough has been done to give us a tolerably clear insight into the processes by which the food we eat supplies our bodily wants.

The bulk of our best definite knowledge of these matters comes from direct experiments in which animals are supplied with food of various kinds, and the effects noted. The food, the excrement, solid and liquid, and in some cases the inhaled and exhaled air, are measured, weighed, and analyzed. Many trials have been made with different animals, horses, oxen, cows, sheep, goats, swine, dogs, rabbits, birds, and the like, and a considerable number with human beings of both sexes and different ages. In the philosophical planning of the researches, in the ingenuity manifested in devising apparatus, in the accuracy, thoroughness, patience in execution, and magnitude of the work, as well as in the distinguished genius of many of the workers, chemico-physiological science has here, as in other specialties, assumed the highest rank among the sciences of our time. With the rest it has brought us where we can estimate the nutritive values of foods from their chemical composition with so near an approach to accuracy that in Germany, where the best research is done, tables, giving in figures the composition and nutritive valuations of foods, have been prepared by eminent physiologists, and are coming into general use among the people. To give a brief account of the outcome of such work as this in its relation to the nutritive values of foods is the chief object of this article.

The Nutrients of Foods and their Functions in Nutrition.—First, however, it may be well to recapitulate very briefly some of the main results of later research respecting the nutritive ingredients of foods, and their work and uses in nutrition. This is the more proper, since the more lately ascertained facts have not only added greatly to our knowledge, but the older theories have thereby been materially modified; and, further, because the later views have not yet become current in the English language.

We eat meat and fish, potatoes and bread, to build up our bodies, repair their wastes, and supply them with fuel for the production of heat and force. In other words, our food supplies, besides water and mineral substances, several classes of nutrients, of which the most important are albuminoids or proteids, carbohydrates and fats, and whose functions are to be transformed into the various tissues and fluids of the body, muscle and fat, blood and bone, and by their decomposition and consumption to produce heat and force.

Albuminoids, Proteids, or Protein Compounds.—These contain carbon, oxygen, hydrogen, and nitrogen, the latter element being characteristic of albuminoids. Albuminoids occur in plants, as in the gluten of wheat; and in the animal body, as in the fibrinogen and fibrinoplastic substances of blood, in the fibrin of muscle, in albumen (white) of eggs, and in the casein (curd) of milk.

The albuminoids are the most important of the nutrients of foods. Not only do they share in the formation of the fatty tissues and in the supply of material for the production of animal heat and muscular power, thus performing all of the functions of the other food ingredients in the body, but they also have a work of their own in the building up of the nitrogenous tissues, muscles, tendons, cartilage, etc., in which none of the other ingredients can share.

Carbohydrates, of which we have familiar examples in sugar, starch, and cellulose, differ from the albuminoids in that they have no nitrogen. They have, according to the best experimental evidence, no share in the formation of nitrogenous tissues in the body. That they are transformed into fats to any considerable extent is at least questionable. Their chief use in food seems to be to supply fuel for the production of animal heat, and very probably of muscular energy. They also do a most useful duty in preventing the consumption of albuminoids and fats, by being consumed themselves. They are very important constituents of food, but less so than the albuminoids.

Fats are familiar to us in the vegetable fats and oils, as linseed and olive oils; in fat meat, tallow and lard, and in butter, etc. Fats, like carbohydrates, consist of carbon, oxygen, and hydrogen, and are destitute of nitrogen. The fats of food are stored in the body as fats, transformed into carbohydrates, and serve as

fuel to produce heat and probably muscular force, but do not form nitrogenous tissue. They are more valuable than the carbohydrates, because richer in carbon and hydrogen, the elements which give value to fuel, and because they supply the body with fats.

Besides the nutrients named above, there are others of inferior but nevertheless not inconsiderable importance in nutrition, as kreatin, sarkin, inosite, and so on. The proportions of these are, however, so small and their functions so little understood, that it is at present customary to leave them out of account or group them with the other nutrients in estimating the nutritive values of foods. Classifying the organic nutrients of food thus roughly, the chief uses of each class in supplying the body with material for its tissues and fluids, and for the production of heat and muscular force, may be briefly outlined as follows:

Nutrients.	Functions in Nutrition.
ALBUMINOIDS.	{ Are transformed into ALBUMINOIDS. " " " FATS. " " " CARBOHYDRATES. { Serve for FUEL.
PROTEIN COMPOUNDS.	
CARBOHYDRATES.	
FATS.	{ Are transformed into FATS. " " " CARBOHYDRATES. { Serve for FUEL.

Proportions of Nutrients in Different Foods.

—As the functions of the nutritive ingredients have become better understood, more and more attention has naturally been devoted to the investigation of the composition of foods, and the nature and proportions of their various constituents; so that, although only the later work has been done by methods fully in accord with the demands of chemical and physiological science as it now exists, yet a large amount of reliable information has already accumulated. Many hundreds of analyses of vegetable and animal food products have been executed in Europe, especially in Germany. In this country the analytical investigation of this sort has not until within a few years past been at all extensive, and that which has been done has been confined almost exclusively to materials used for feeding domestic animals.

Under the auspices of the Smithsonian Institution and the United States Fish Commission, an investigation of the chemical composition and nutritive values of some of our American foods has been undertaken in the chemical laboratory of Wesleyan University, Middletown, Connecticut, under the direction of Professor W. O. Atwater. This work has begun with analyses of fish, but is being extended to other animal and to vegetable foods. The research has been going on for some time, and now includes chemical analyses of some two hundred specimens of the flesh of fish, oysters, lobsters, and other "fish-foods," with a number of meats of various sorts, and some vegetable products. Some of the results, along with those of similar European products, are given in the table herewith:

672 NUTRITIVE INGREDIENTS AND VALUES OF THE FOOD WE EAT.

Animal Foods.—The figures for meat, game, fowl, milk, eggs, etc., as well as those for vegetable food, are from European analyses, which are far more numerous at present than the American. Those of fish and invertebrates, on the other hand, are American—the number of analyses made here being already several times as large as the European.

The first column of the table of animal foods gives the amounts of edible solids, actual nutrients in the samples as analyzed. The European figures do not include these data. With the fish and invertebrates, however, they are given.

Considered from the stand-point of the food-value, meats, fish, etc., as we buy them in the markets, consist of—1. Flesh or edible portion; 2. Waste—bones, skin, entrails, etc. The proportions of waste matter in different kinds of fish, and in different samples of the same kind in different condition, vary widely. Thus, a sample of flounder contained 68 per cent of waste matter and only 32 per cent of flesh, while one of halibut-steak had only 18 per cent of waste and 82 per cent of edible materials. Among those with the most waste and least edible flesh are the porgy, bass, perch, lobster, and oyster. Among those with the least waste are fat shad, fat mackerel, and dried and salt fish.

Coming to the edible portion, the flesh, we find this to consist of—1, water; 2, solids—actual nutritive substances. The proportions of water and solids in the various kinds of flesh are much more variable than most people would suppose. Thus, we find the proportion of water in meats to vary from one half or less in the fatter to three fourths or more in the leaner sorts. Again, the flesh of flounder has 85 per cent of water and only 15 per cent of solids, while that of salmon has 36½ per cent of solids and 63½ per cent of water; and the flesh of dried, smoked, and salt fish has still less water. Among the more watery kinds of fish are the flounder, cod, striped bass, and blue-fish. Among those with less water and more solids are mackerel, shad, salmon, and salt and dried fish. In brief, as compared with ordinary meats, the flesh of fish generally, though not always, contains more water.

To get the actual nutritive substance in a sample of fish we must first subtract the waste—the entrails, bones, skin, etc.—which leaves the flesh; then we must allow for the water in the flesh. What remains will be the total edible solids, or actual nutritive substance, in the sample. Some of the detailed statistics of the proportions of total nutrients in fish and invertebrates will be of interest. The following data are from a report of the investigation by Professor Atwater above referred to, in the last report of the United States Commissioner of Fish and Fisheries. The figures apply to the samples of fish as retailed, in some cases whole, in others dressed:

TOTAL EDIBLE SOLIDS. ACTUAL NUTRIENTS IN SAMPLES OF FISH, AS RECEIVED FROM MARKETS.

KIND OF FISH, AND PORTION ANALYZED.	Percentage of nutrients, Individual samples.	Average.
California salmon, edible portion of anterior part.....	Per cent. 39-39	Per ct.
Salmon, entrails removed.....	26-57
Smoked halibut.....	31-63
Salt mackerel.....	30-97
Boned cod, salt.....	30-91
Canned salmon.....	29-95
Smoked herring.....	25-66
Eels, salt-water; skin, head, and entrails removed.....	22-50
Halibut, section of body, fat.....	27-13
Halibut, posterior part of body, lean.....	15-67	21-40
Spanish mackerel, whole.....	20-65
Salt cod, "boat fish".....	20-99
Salt cod, "channel fish".....	19-09
Shad, whole.....	18-56
Shad, whole.....	15-51
Shad, whole.....	14-81	16-29
Turbot, whole.....	15-61
Mackerel, whole.....	28-95
Mackerel, whole.....	18-24
Mackerel, whole.....	12-97
Mackerel, whole, lean.....	11-76	15-48
Salmon-trout, whole, lean.....	14-88
White-fish, whole.....	18-69
Spent salmon, female, whole.....	14-87
Spent salmon, female, whole.....	12-17	18-52
Muskallonge, whole.....	12-52
Smelt, whole.....	12-51
Sheep's-head, entrails removed.....	11-99
Alewives, whole.....	11-95
Herring, whole.....	11-52
Cod, head and entrails removed.....	11-92
Cod, head and entrails removed.....	10-98	11-45
Spent landlocked salmon, male, whole.....	10-97
Spent landlocked salmon, female, whole.....	10-74	10-56
Brook-trout, cultivated, whole.....	10-77
Black-fish, whole.....	10-72
Red snapper, entrails removed.....	10-87
Red snapper, whole.....	9-83
Porgy, whole.....	11-73
Porgy, whole.....	7-73	9-76
White perch, whole.....	10-08
White perch, whole.....	8-73	9-41
Black bass, whole.....	9-57
Striped bass, whole.....	9-01
Striped bass, whole.....	8-87	8-94
Haddock, entrails removed.....	9-07
Haddock, entrails removed.....	8-63	8-88
Yellow pike-perch, whole.....	8-45
Flounder, entrails removed.....	7-06
Flounder, whole.....	4-87

Foul or Spent Fish versus the same in Good Condition.—Some very interesting results are found in comparing the foul or spent fish with the same in good condition. As it becomes lean, the fish loses nutritive value in three ways: first, in total loss of weight; second, in relative increase of waste and decrease of flesh; and, third, in the deterioration of the quality of the flesh, which, in the lean fish, is more watery and considerably less valuable, pound for pound, than the flesh of the same fish in good condition. Thus, the flesh of spent salmon is rated in the last column at 85, while that of fat salmon came up to 108. There is in this a strong argument in favor of legislation against the capture of fish out of season.

Fish as Brain-Food.—The report referred to contains the following statement regarding the wide-spread notion that fish is particularly valuable for brain-food on account of a large con-

tent of phosphorus: "The percentages of phosphorus in the analyses above reported are not larger than are found, according to the best analyses, in the flesh of other animals used for food. The number of reliable determinations of flesh in the latter are, however, small, and it is, though very improbable, yet within the range of possibility that a more complete investigation of the subject might reveal a smaller proportion of phosphorus in meats than in fish. But, even if the fish were richer in phosphorus, there is no proof that it would, on

that account, be better for brain-food. The questions of the nourishment of the brain and the sources of intellectual energy are too indeterminate to allow decisive statements, and too abstruse for speedy solution in the present condition of our knowledge."

Oysters.—From the same source we quote similar statistics regarding oysters from various localities. It should be observed, however, that the analyses are as yet insufficient to show how accurately these figures express the average composition of oysters of the kinds named:

PROPORTIONS OF FLESH, OF LIQUIDS, AND OF TOTAL SHELL CONTENTS (FLESH AND LIQUIDS) IN SAMPLES OF OYSTERS.

FLESH IN WHOLE OYSTER.	Per cent.	LIQUIDS IN WHOLE OYSTER.	Per cent.	TOTAL SHELL CONTENTS OF OYSTERS.	Per cent.
